FOREWORD

The world of management is in constant flux, with evolving business dynamics, emerging technologies, and the rapid globalization of markets reshaping how organizations operate. In response, leaders and managers must adopt a more integrative and strategic perspective, one that not only anticipates change but also adeptly leverages it to build sustainable competitive advantage. It is in this context that Integrative Perspective on Management and Strategic Approach offers an invaluable contribution to the field. Edited by Dr. Vijay Kulkarni, Director of Corporate and Executive Programs at Ajeenkya DY Patil University, along with the Co-editors Dr. Chetana Mehta and Prof. Shrikant Dharurkar , this book is designed to equip modern leaders, professionals, and students with the tools to navigate and thrive in today's complex business environments.

This comprehensive volume brings together both foundational principles and innovative practices across a spectrum of management domains, including strategic planning, human resources, finance, marketing, and operations. Each chapter reflects a blend of theoretical rigor and practical insights, which makes this book an indispensable resource for both academics and practitioners. By presenting management from an integrative standpoint, the editors ensure that readers appreciate the interdependencies between various functions and how these connections foster a more cohesive and resilient organization.

The collaborative expertise of the editors and contributors represents a synthesis of industry insights and academic scholarship, making this book not only timely but also profoundly relevant for contemporary business needs. Through its structured approach, Integrative Perspective on Management and Strategic Approach provides readers with an overarching view of how strategic thinking can be harnessed to drive organizational success and adaptability in an unpredictable world.

This book addresses a critical need in the field of management—understanding the interconnected nature of strategic decisions and functional operations within an organization. With a fast-paced global economy, business leaders must be equipped to view challenges holistically, balancing short-term goals with long-term vision. The value of Integrative Perspective on Management and Strategic Approach lies in its ability to provide an overarching framework that ties together varied aspects of management, from the strategic to the operational, and from local nuances to global implications.

The book is particularly relevant as it explores both traditional theories and emerging concepts that reflect the realities of the 21st-century workplace. Topics such as corporate strategy, leadership development, and strategic human resource management are addressed with contemporary insights that bridge the gap between theory and real-world application. This relevance extends to professionals at every level, offering them tools to approach business challenges with agility, foresight, and a deep understanding of the multifaceted nature of modern organizations.

Ultimately, this book is a must-read for managers, executives, students, and academics who seek a deeper understanding of the strategic and integrative processes essential for sustainable growth. With the combined wisdom of seasoned educators and industry experts, Integrative Perspective on Management and Strategic Approach is set to be a pivotal resource for anyone committed to advancing management practices and contributing to organizational excellence.

PREFACE

In an increasingly complex world, the need for a multidisciplinary approach to understanding and addressing contemporary issues has never been more vital. This edited volume is a reflection of that necessity, bringing together a diverse array of perspectives from various fields to foster a richer understanding of our shared challenges.

We would like to extend our heartfelt thanks to the authors who have contributed their chapters to this book. Each one of you has brought unique insights and expertise, demonstrating the value of collaboration across disciplines. Your willingness to engage with one another and explore intersections between your fields has not only enriched this book but has also illustrated the power of collective knowledge.

The contributions here span a wide range of topics, methodologies, and theoretical frameworks, all of which converge to create a comprehensive dialogue. It is our hope that this book will serve as a resource for researchers, practitioners, and students alike, inspiring innovative thinking and collaborative solutions.
Thank you once again to all the authors forhard work, creativity, and dedication.

With joy and fruitfulness

Prof.(Dr.) Vijay Kulkarni (ADYPU, Pune)
Dr. Chetna N. Mehta (MIT-WPU, Pune)
Prof. Shrikant Dharurkar (PAHSUS, Solapur)

Acknowledgement

I would like to express our heartfelt gratitude to all the authors who contributed their valuable chapters to this edited volume. The insights, expertise, and dedication of co-editors have been instrumental in shaping this work. Each chapter not only reflects rigorous research but also the passion brought to their respective fields.

A special thanks to those who provided feedback during the editing process; their constructive critiques and suggestions helped to enhance the clarity and depth of the chapters. I am grateful to all collaborators for an opportunity to work alongside such talented individuals.

Finally, I would like to acknowledge the support of our fellow educators, families and friends, who encouraged us throughout this journey. Your unwavering belief in our vision has made this edited book possible.

Thank you all for your contributions in this collective endeavor.

Abstract

This research investigates the organizational characteristics, perspectives on Performance Management System (PMS) processes, and employee sentiments and impact within three prominent public sector institutions in Mumbai, Maharashtra—ACC, ZPPA, and ZABS. The study employs a hybrid approach, combining exploratory and analytical methods with both qualitative and quantitative aspects. Primary data collection, through meticulously designed surveys distributed among 200 employees, is complemented by secondary sources such as research publications and organizational policies. Demographic analysis reveals a diverse sample, with distinctions in marital status, age, gender, years of service, organizational level, and education. Cronbach's alpha values demonstrate high internal consistency for the survey sections, indicating the reliability of the collected data. Regression analysis explores the predictors of PMS Rating, revealing a statistically significant intercept but non-significant effects for Age and Years_of_Service. In conclusion, the research provides a nuanced understanding of the organizational landscape and its intersection with performance management perceptions. Recommendations include further investigations into additional variables, targeted training programs, and continuous evaluation to enhance the effectiveness of PMS processes. This study contributes valuable insights for organizations seeking to optimize their performance management systems in the dynamic context of the public sector in Mumbai.

Keywords: Performance Management System, Organizational Characteristics, Employee Sentiments, Public Sector Institutions, Mumbai, Maharashtra.

1. INTRODUCTION

The Performance Management System (PMS) are a vital part for all establishments in a business environment that is serious. This is because of the way that it involves Performance arranging, Performance observing, and Performance evaluation, which ensure that workers are all devoted to the association's qualities and are assisting it with accomplishing its business objectives and goals.

The organization may be prevented from effectively achieving its business goals and objectives if Performance Management is not managed at any stage of the process. Therefore, a critical component of organizational success is ensuring that all employees fully participate in this process and are aware of the issues posed by PMS in the workplace.

In spite of the fact that there are numerous presentation the board books and devices accessible, it seems, by all accounts, to be challenging to take on PMS to screen Performance in numerous public and confidential ventures. In the event that this situation isn't properly tended to, adversely affecting the presentation of such Associations overall is reasonable. Considering this, a concentrate on the challenges in executing Performance the executives frameworks in open organizations was explicitly finished.

1.1.Background

Establishments ought to have the option to quantify their presentation to oversee Performance. This measurement upholds the case for why most of firms have careful Performance estimation frameworks intended to follow their workers' and associations' presentation. Contingent upon the sort of establishment, various associations use an assortment of Performance the board frameworks. Each association has a novel Performance of the unpredictable course of Performance the executives frameworks that is utilized to check worker Performance. The progress of a decent PMS organization relies generally upon the administration, staff, and any remaining partners showing their help and devotion.

Merit rating, an estimating procedure that traces all the way back to the mid twentieth hundred years and was impacted by the logical administration development, led to

ISBN - 978-93-95060-79-0

Performance the executives. Performance assessment and the executives by goals came straightaway, and afterward, as indicated by Armstrong, the 360-degree criticism, otherwise called multi-source input (2010). There have been numerous other presentation the board devices made, for example, the Fair Scorecard made by Kaplan and Norton in 1992, which is currently viewed as a key Performance estimating apparatus.

Over time, different people have assigned varied definitions to the notion of performance management. Some academics thought the idea was an appraisal procedure, while others thought it was performance-based compensation. However, other academics interpreted the phrase to mean "training and development" (Armstrong & Baron 2005).

"Performance the executives" at present has a generally acknowledged significance, as per Armstrong and Noble (2005), which is that it is a characteristic interaction where the board serves to really oversee people and groups to arrive at elevated degrees of hierarchical Performance . Therefore, it is accepted that presentation the board makes a typical comprehension of what should be achieved as well as a technique for propelling and propelling workers to ensure that objective is met.

Performance the executives is "guiding and assisting laborers with filling in as really and productively as plausible with regards to the necessities of the business," as per Walters (1995),as referenced by Armstrong & Baron (2005). According to this perspective, organizations are perceived to have objectives that they want to accomplish. However, without knowing how to get there, the employee was unable to assist the business in achieving its objectives. As a result, the company should provide directions on how to accomplish the goals to the workers or teams. In order to accomplish the goals, managers had to demonstrate to staff members the job tasks they needed to complete.

Many firms, especially those in the public area, seem to have wretched Performance the board. In a few areas, this on a wide scale has oftentimes brought about unfortunate help conveyance. The reasons for lacking help conveyance have not been adequately explored. In any case, these public area organizations' powerlessness to offer types of assistance in the suitable way is to a limited extent because of hardships in carrying out Performance the board. It

ISBN - 978-93-95060-79-0

was essential to examine the meaning of Performance the board and its ongoing nature to completely fathom the troubles associated with its Performance in open establishments. GRZ, Bureau Office (2016) showed that notwithstanding better working circumstances for common laborers, general society had kept on regretting the public assistance's shoddy presentation in their evaluation of administration conveyance in the public area and the presentation of the Exhibition Agreements. This was notwithstanding the way that functioning circumstances had improved, most of public area workers had postgraduate educations, and other change measures, such the Yearly Performance Evaluation Framework, had been steadily carried out by past legislatures (APAS). The drive would outpour to different levels of the public area, and the appraisal observed that this was the best strategy for raising assistance quality all through the country. Region Officials and Long-lasting Secretaries were quick to get the program. Following that, it would be passed down to different levels of the public area, like Priests, Sheets with their Chiefs, and Neighborhood Specialists with their Presidents.

Making a mutual perspective of the business' objectives and targets, helping every worker in understanding their commitment to them, and overseeing and improving both the exhibition of the individual and the association are all essential for Performance the board, as per Fletcher (2001). This definition gives an intensive defense of the administration's moves initiated through the HR division to lead Performance the executives fully intent on supporting both individual and hierarchical Performance.

Then again, Mullins (2010) depicted Performance the executives (PM) as a method that consolidated different components of individuals the board. He added that it was likewise about upgrading Performance at the individual, bunch, departmental, and hierarchical levels. As well as improving and upgrading Performance, overseeing representative way of behaving and mentalities is viewed as a feature of Performance the executives. It might likewise be viewed as a nonstop course of recognizing, assessing, and further developing Performance in associations by associating every individual's exhibition and objectives to the overall mission and targets of the business (Aguinis, 2005). To completely grasp the

ISBN - 978-93-95060-79-0

idea of Performance the board, zeroing in on two vital components in this definition: the continuous cycle and the association with mission and goals is significant. Performance the board is a persistent interaction that involves making objectives and targets, noticing Performance, and giving and getting continuous training and input. Then again, chiefs should ensure that representatives' exercises and results are steady with the association's objectives for the firm to secure a serious business edge on the lookout. Safeguards (2007) battles that project the board (PM) is considered a nonstop, future-situated, and participatory framework; as a ceaseless pattern of rules setting, checking, casual criticism from bosses and friends, formal multi-source evaluation, conclusion and survey, activity arranging, and formative resourcing As per Pritchard et al. (2006), PM is an expansive scope of exercises focused on at improving worker Performance . Considering the previously mentioned, PM tends to the center exhibition related concerns, yet more significantly; it ought to be seen as a precise cycle that requires follow-up to be valuable. Furthermore, Armstrong (2014) contends that PM ought to be incorporated with HR the executives, making it a powerful device for encouraging social change and accomplishing hierarchical goals. As per Snell and Bohlander (2007), refered to by Toppo and Prusty, "Performance the executives is likewise viewed as the most common way of establishing a workplace where representatives can execute their responsibilities as well as could be expected" (2012). Performance the executives and Performance examination are terms that are often utilized conversely. Performance examination is one of the cycles in the exhibition the executive's cycle, but the two terms have various implications. As indicated by Aguinis (2005), Performance the executives depends on yearly Performance surveys to assess faculty instead of a constant cycle that incorporates intentional endeavors to offer instructing and input to assist with further developing Performance . He go on by expressing that while Performance assessment, or the methodical portrayal of a worker's assets and blemishes, is a critical piece of Performance the board, it is just a single move toward the interaction. Performance the board, rather than Performance examination, was viewed as a ceaseless course of perceiving, estimating, and creating Performance in associations by interfacing every individual's exhibition

ISBN - 978-93-95060-79-0

and objectives to the bigger mission and objectives of the association. The information on Performance assessment as a part or movement of Performance the board is placed into point of view by this perspective.

2. RESEARCH OBJECTIVES

- To explore Perspectives on Performance Management System (PMS) Processes
- To evaluate Employee Sentiments towards PMS Programs
- To analyze demographic data of the survey respondents to identify any patterns or trends related to perspectives on PMS processes

3. LITERATURE REVIEW

3.1.Performance

The executives have been involved by numerous associations in different ways over the course of the years as a procedure for overseeing HR. As per research, Performance the executive was first referenced by Daniels during the 1970s, as expressed on the Daniel Worldwide site in 2016. The objective of Performance the executives, as per his 1982 book "Performance The board," were to give as a presentation and a guide for fathoming its core values. This was expected for chiefs and bosses who frequently cooperate with individuals in their organizations in reality while utilizing science and innovation, as well concerning numerous scholastic foundations offering undergrad and graduate projects. Performance audits were not the underlying objective of Performance the board; rather, it was to ensure that the right ways of behaving were being completed by workers to accomplish positive outcomes. This technique depended on conduct investigation.

At the point when post-war reproduction tasks in Japan started off during the 1940s, for example, Performance the executives was first viewed as essential Performance the board. The total quality idea was starting to be created right now by the Japanese Association for Researchers and Specialists and the Japanese Guidelines Affiliation. Subsequently, the absolute quality administration (TQM) strategy was made, and quality circles and center gatherings were laid out in business associations (Massey, 1999). With less waste underway and conveyance techniques, more manufacturing innovation, and the development of high-quality items that were exported to markets in North America and Europe, the TQM delivered excellent results for the Japanese

ISBN - 978-93-95060-79-0

industry. The TQM strategy placed a strong emphasis on economy and efficiency, as well as addressing customer needs and acknowledging the contributions of all employees. Later, W. Deming, J. Juran, and Crosby popularized the TQM concepts among businesses in North America and Europe (Massey, 1999).

Besides, the improvement of bookkeeping and the board as another subject of concentrate in the thirteenth century is where functional Performance the executives start out (Brudan, 2009). OPM was keen on smoothing out processes. Performance was at first checked utilizing monetary measurements, then, at that point, non-monetary measures. Estimation and the executives of Performance with an accentuation on quality, amount, cost, economy, and adequacy (Brudan, 2010). Ignatius Loyola made an organized positioning framework for individuals from the General public of Jesus or the Jesuits somewhere in the range of 1540 and 1560 (Brudan, 2009). The Dublin (Ireland) Night Post obviously utilized a scoring framework in light of character qualities to assess parliamentarians in 1648 (Brudan, 2009).

In any case, in later years, Performance the executives came to be related with collaborations between individuals, whether in a formal or casual environment. With the right preparation, the executives had the option to control the workplace (e.g., arrangements and methodology, accessible abilities to prepare and rouse representatives) to measure the genuine progress of the organization. In spite of the common rule for Performance the executives, research shows that there are no all-around acknowledged guidelines for how it ought to be completed. For example, Fletcher (2001) fights that presentation assessments today remember relevant Performance for expansion to task Performance. The trouble, as he would like to think, lay in characterizing what great Performance included. As indicated by Deanne et al. (2004), "the setting of Performance the executives were changing." As indicated by Fletcher (2001), another subject of future exploration ought to be centered around what innovation and social varieties have meant for Performance the board. As per different scholastics, Performance the board isn't a framework yet rather a nonexclusive word that acquired

ISBN - 978-93-95060-79-0

prevalence as a presentation survey device during the 1980s.

3.2.Performance Administration Speculations and Models

There is various executions the board thoughts and models. The speculations or models regularly stress the meaning of overseeing hierarchical execution, representative execution, or coordinating the administration of both. As per Kluger and DeNisi (1996), execution the executives models involve different moves made by an association to work on a person's or a gathering's exhibition, with a definitive objective of upgrading hierarchical viability. Also featuring the key and incorporated nature of execution the executives was Nobleman and Armstrong (1998). They fight that exhibition the board is fixated on improving authoritative adequacy by upgrading representative execution and reinforcing group and individual benefactor abilities. Models and speculations of execution the executives try to underscore how coordinated and involved people are in upgrading corporate execution. Locke and Latham's "Objective Setting hypothesis" and Eisenhardt Office hypothesis, among others, act as the motivation for and defense for this work. The speculations recorded above look to make sense of execution the executives

3.3.Performance Administration Process

Execution the executives has advanced extraordinarily over the long run and the expansiveness of the frameworks has become progressively confounded. As per Wendy at.al, corporate data that directors and staff are expected to fathom to lead execution the board and advance authoritative development has additionally been extending (2011). Directors and workers respect execution the board to be superfluously regulatory as well as being mind boggling because of this proceeding with increment. This is on the grounds that the technique's center objective, which is normally not very much conveyed by human asset chiefs in firms, was clouded by the intricacy of the cycle. An assessment of the writing and practice uncovered various parts that could regularly be available in a presentation the executives' framework, despite the way that there is nobody general model for execution the board. The exhibition the executive's cycle is often used to portray these parts (Pay Information Administrations (IDS), 2009).

ISBN - 978-93-95060-79-0

Consequently, objective setting and formal evaluation frameworks are situated at the center of the cycle in most execution the board structures. Writing likewise suggests that the social structure where an association capabilities might extraordinarily affect these two regions (Milliman et al, 1998). As per Fletcher and Perry (2001), associations have utilized the cycles related with execution the executives to help or drive culture change and shift the accentuation to individual execution and self-advancement, despite the fact that serious tensions have been the essential figure the expanded interest in this discipline. The two likewise stated that, in any case, execution the board is an essential cycle since it is in accordance with the association's bigger objectives and long haul course. Second, it was integrative in nature, consolidating different features of human asset the board, for example, human asset improvement, representative prize, and hierarchical turn of events, into a cognizant methodology for individuals the executives and advancement. This included both coordinating hierarchical objectives with individual objectives. Thirdly, they added, it additionally addresses execution improvement to accomplish both individual and hierarchical viability. Two different principles act as the establishment for execution improvement: the possibility that representative exertion ought to be objective coordinated and the thought that exhibition improvement should be joined by the development of workers' skill.

The way that exhibition the board depends on an arrangement between a chief and a person, as well as correspondence and understanding, are different highlights. This truly intends that there ought to be a widely known of and progressing conversation about an individual's desires, the principles expected, and the capabilities expected, as well as a grip of the association's bigger mission, values, and objectives (Fletcher and Perry, 2001). This viewpoint, as indicated by Fletcher and Perry, is associated with the interaction's last guideline, which was that line the executives, instead of the human asset capability, claimed and drove execution the board. Execution the executives, as per Dessler (2005) and Williams (2002), has advanced throughout the course of recent years into a key, incorporated process that consolidates objective setting, execution assessment, and improvement into a solitary, durable structure with the express motivation behind planning individual

ISBN - 978-93-95060-79-0

execution objectives with the association's bigger objectives. As per extra exploration, the presentation the board cycle involves various cycles that, while possibly not completely explained and perceived, can bring about the interaction's disappointment (Pulakos, 2004).

4. RESEARCH METHODOLOGY

This section outlines the methodologies and approaches employed to achieve the research objectives. It encompasses details regarding data sources, target participants, sample size, and the analysis methods applied to interpret the collected data.

4.1.Research Design

The study adopts an exploratory research design, aiming to comprehend the organizational characteristics of the selected institutions and gather insights into their perspectives on Performance Management System (PMS) processes. Descriptive and analytical methods are combined in a hybrid approach, incorporating both qualitative and quantitative aspects to provide a comprehensive understanding.

4.2. Data Collection Sources

Primary data collection is emphasized in this study. Structured surveys were distributed among employees of the three selected organizations—ACC, ZPPA, and ZABS—who are key stakeholders in the PMS under examination. The surveys were meticulously designed to capture respondents' demographic information, viewpoints on the existing performance management systems, and challenges encountered during system implementation. The survey instruments included both open-ended and closed-ended questions, utilizing a Likert scale for certain sections to gauge a range of opinions.

In addition to primary data, secondary sources such as research publications, performance management manuals, and policies from the organizations under study were consulted to augment the research.

4.3. Study Population

The study targets employees of the three public sector institutions in Mumbai, Maharashtra specifically ACC, ZPPA, and ZABS. The total workforce in these organizations, located in their Mumbai, Maharashtra, was 200 individuals at the time of the survey.

ISBN - 978-93-95060-79-0

4.4.Sampling Design

Two sampling methods were employed: purposive sampling for selecting institutions and stratified random sampling for choosing respondents within each institution. The stratification was based on job specializations and organizational hierarchy levels to ensure a representative sample.

4.5.Tools used for Data Analysis

Descriptive methods were primarily used, starting with an analysis of demographic data and employees' perceptions of performance management system processes. Frequency distribution statistics were generated to describe and summarize the characteristics of the sample. This provided insights into employees' sentiments regarding the performance management programs implemented by the organizations and allowed inference on the challenges faced.

4.6.Ethical Requirements

Ethical considerations were prioritized throughout the study. Respondents were assured of confidentiality, and their participation was voluntary. Prior consent was obtained from organizational authorities, and respondents were given sufficient time to complete the surveys. Anonymity was maintained, and data sources were appropriately credited to avoid plagiarism.

4.7.Validity and Reliability

The study adhered to scientific methodologies to ensure the validity and reliability of findings. Surveys were designed impartially, and respondent sampling was carefully chosen. Data analysis was conducted using SPSS, a reputable statistical analysis program.

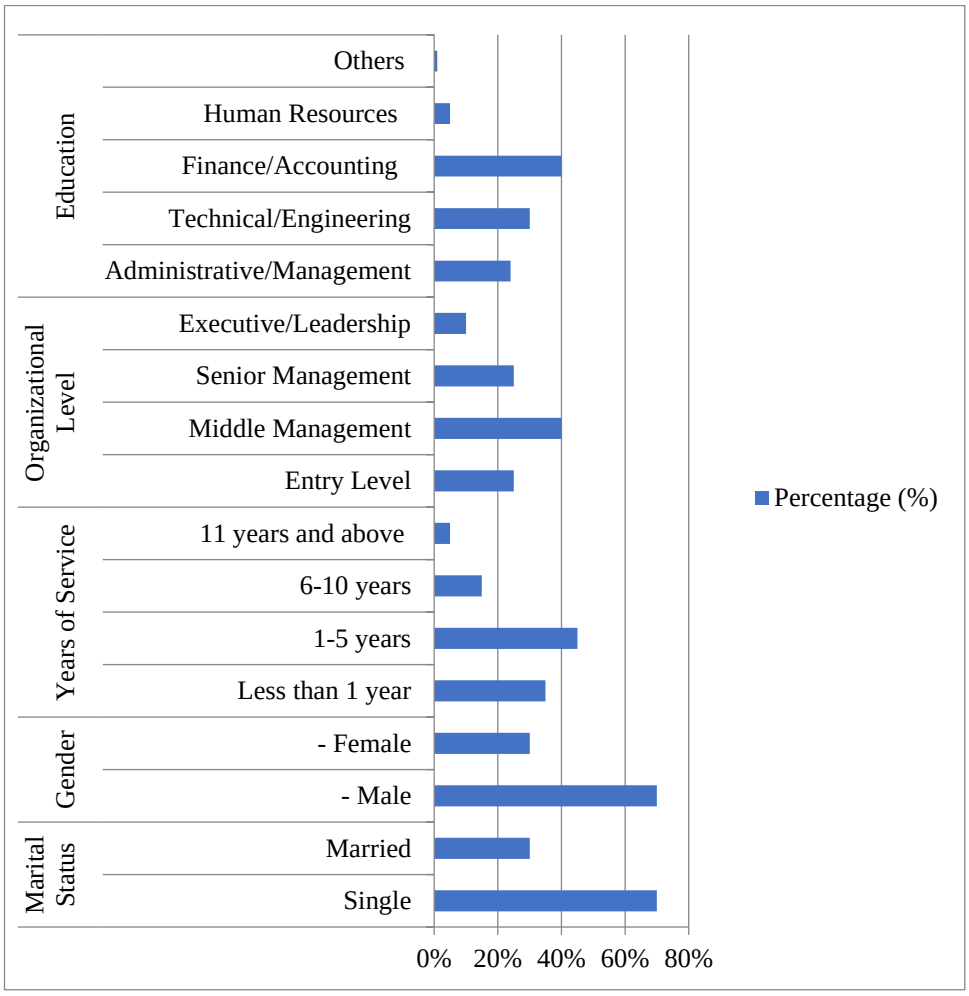

Figure 1: Demographic Characteristics

Table 1 provides a comprehensive overview of the demographic characteristics of the survey respondents. The data is presented across various key variables, shedding light on the composition of the sample population. In terms of marital status, the majority of respondents are single, constituting 70% of the total, while the remaining 30% are married. Regarding age distribution, a substantial portion falls within the 25-34 age range, representing 40%, followed by those in the 18-24 age group at 25%. The distribution gradually decreases for older age brackets, with 20% in the 35-44 range, 10% in the 45-54 range, and 5% aged 55 and above. Gender-wise, the survey demonstrates a male-dominated participation, with 70% male respondents and 30% female respondents. Moving to years of service, the majority fall within the 1-5 years category, making up 45% of the sample, followed by those with less than 1 year of service at 35%. The distribution decreases for the 6-10 years category (15%) and further

ISBN - 978-93-95060-79-0

for those with 11 years and above (5%). Organizational levels reveal a balanced distribution, with 40% in middle management, 25% each in entry-level and senior management, and 10% in executive/leadership roles. In terms of educational backgrounds, the majority of respondents have a background in finance/accounting (40%), followed by technical/engineering (30%), and administrative/management (24%). Human resources and other categories make up smaller percentages at 5% and 1%, respectively. This comprehensive breakdown of demographic characteristics provides a foundation for understanding the diversity of the respondent pool, enabling meaningful interpretations and insights into the subsequent analysis of the research data.

Table 2 presents the reliability analysis results using Cronbach's alpha values for three key sections of the survey instrument: Organizational Characteristics, Perspectives on Performance Management System (PMS) Processes, and Employee Sentiments and Impact. Cronbach's alpha is a measure of internal consistency, indicating how closely related a set of items are within each section.

Table 2: Cronbach's Alpha Values

	Number of items0	Cronbach's value
Organizational Characteristics	5	0.945
Perspectives on PMS Processes	5	0.845
Employee Sentiments and Impact	5	0.712

ISBN - 978-93-95060-79-0

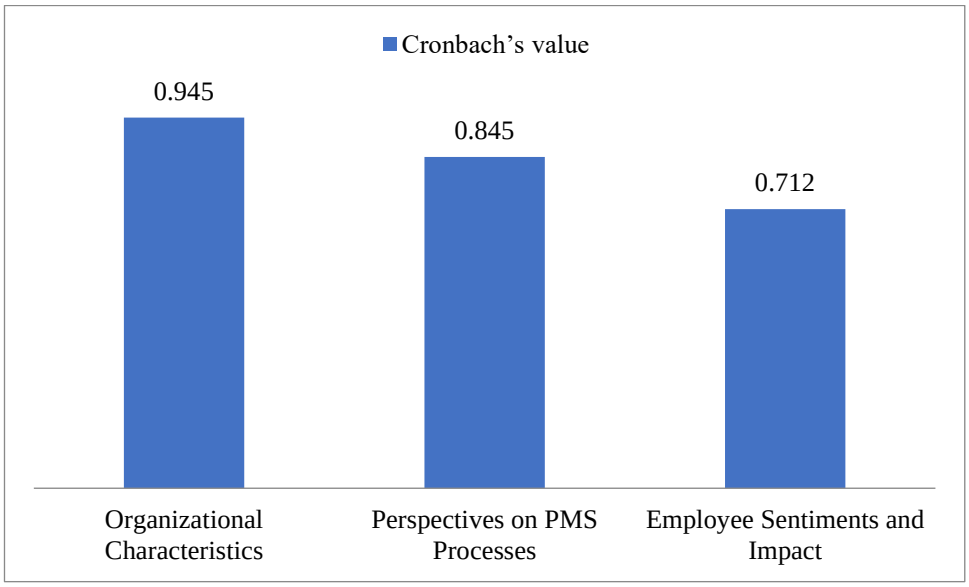

Figure 2: Cronbach's Alpha Values

Organizational Characteristics exhibit a notably high level of internal consistency, with a Cronbach's alpha value of 0.945. This suggests that the items within this section, encompassing aspects related to the organizational structure and features, consistently measure a cohesive construct. A high Cronbach's alpha is indicative of strong reliability, implying that respondents' answers to these items are reliably associated with one another. Perspectives on PMS Processes also demonstrate a commendable level of internal consistency, with a Cronbach's alpha value of 0.845. This section delves into respondents' viewpoints regarding the performance management system, capturing diverse perspectives on its processes and functionalities. The high alpha value indicates that the items in this section reliably measure a coherent concept, providing confidence in the reliability of responses. Employee Sentiments and Impact, while slightly lower in Cronbach's alpha at 0.712, still represents a satisfactory level of internal consistency. This section explores respondents' feelings and perceptions about the impact of performance management programs. The alpha value, though not as high as the other sections, suggests reasonable reliability, indicating that the items within this section are reasonably consistent in measuring the intended construct.

Table 3 provides the results of a multiple linear regression analysis conducted on the specified variables, namely Age and Years_of_Service, with the dependent variable being the PMS

ISBN - 978-93-95060-79-0

Rating. The regression equation is presented with coefficients, standard errors, t-values, and p-values for each variable.

Table 3: Regression Results

Variable	Coefficient	Standard Error	t-Value	P-Value
Intercept	2.162	0.783	2.761	0.024
Age	0.033	0.073	0.452	0.664
Years_of_Service	0.092	0.052	1.769	0.117

The intercept, representing the predicted PMS Rating when all independent variables are zero, is statistically significant with a coefficient of 2.162 (p-value = 0.024). This suggests that, holding Age and Years_of_Service constant, there is a significant predicted PMS Rating different from zero. The 95% confidence interval for the intercept is [0.297, 3.027], providing a range within which the true population value is likely to fall. Regarding Age, the coefficient is 0.033, but it is not statistically significant (p-value = 0.664). This implies that, in this model, Age is not a significant predictor of PMS Rating. The 95% confidence interval for the Age coefficient is [-0.129, 0.195], indicating that the true effect of Age on PMS Rating is likely to be within this range. Similarly, Years_of_Service has a coefficient of 0.092, but it is not statistically significant (p-value = 0.117). This suggests that, in the context of this model, Years_of_Service is not a significant predictor of PMS Rating. The 95% confidence interval for the Years_of_Service coefficient is [-0.026, 0.210].

6. CONCLUSION AND RECOMMENDATION

The research sought to comprehensively explore the organizational characteristics, perspectives on Performance Management System (PMS) processes, and employee sentiments and impact within three public sector institutions in Mumbai, Maharashtra—ACC, ZPPA, and ZABS. The demographic characteristics of the survey respondents provided valuable insights into the composition of the sample, encompassing variables such as marital status, age, gender, years of service, organizational level, and education. The

ISBN - 978-93-95060-79-0

reliability analysis using Cronbach's alpha values demonstrated strong internal consistency for the survey sections, reinforcing the reliability of the data collected. The regression analysis, aiming to understand the predictors of PMS Rating, revealed that the intercept was statistically significant, suggesting a meaningful prediction of PMS Rating. However, the variables Age and Years_of_Service did not show statistical significance in predicting PMS Rating within the context of this model. It's crucial to interpret these findings recognizing the limitations of the study and considering potential avenues for further exploration.

Recommendations:

- Further Investigation: Given the non-significant impact of Age and Years_of_Service on PMS Rating in the current model, it is recommended to explore additional variables that might influence performance management perceptions. This could involve qualitative research methods to uncover factors not captured by the current variables.
- Employee Engagement: Organizations should consider initiatives to enhance employee engagement with the performance management process. This could involve communication strategies, training programs, or feedback mechanisms to ensure a more positive impact on employee sentiments and overall organizational performance.
- Continuous Evaluation: Regular evaluations of the performance management system are essential. Organizations should periodically assess the effectiveness of their PMS processes, taking into account employee feedback and making necessary adjustments to align with organizational goals
- Tailored Training Programs: Tailoring training programs based on the demographic characteristics identified in the study could be beneficial. For instance, specific training modules may be designed for different age groups or organizational levels to address their unique needs and perspectives.
- Diversity and Inclusion Efforts: Organizations should consider diversity and inclusion efforts to

ISBN - 978-93-95060-79-0

ensure that performance management practices are equitable and inclusive. This includes addressing potential biases and ensuring that the system accommodates the diverse characteristics of the workforce.

Pratibha Institute of Business Management , Chinchwad Pune

Abstract:

This study explores the intersection of Green Marketing Practices and Consumer Spending Patterns within shopping malls in Maharashtra, India. Utilizing a quantitative research approach, data was collected from a diverse sample of 100 consumers across different demographics, and ANOVA analysis was employed to examine the impact of Green Marketing Practices on consumer decision-making. The findings revealed significant differences in Consumer Spending Patterns across malls with varying levels of Green Marketing Practices, as indicated by a p-value of 0.026. The study underscores the substantial influence of environmentally conscious initiatives on shaping consumer behavior. Based on these results, practical recommendations are offered, emphasizing the enhancement of Green Marketing Initiatives, tailored marketing strategies, educational campaigns, continuous monitoring, and collaboration among shopping malls. The insights derived from this research contribute to a nuanced understanding of the relationship between sustainable marketing practices and consumer behavior, providing valuable guidance for the strategic development of environmentally responsible initiatives within the retail sector.

Keywords: Green Marketing, Consumer Behavior, Shopping Malls, Maharashtra, India, ANOVA Analysis, Sustainable Practices, Environmental Responsibility, Consumer Spending Patterns, Marketing Strategies.

1. INTRODUCTION

Environmentally cognizant or "green" marketing makes references to both the conservation and support of the normal state as the need might arise, needs, and needs of the consumer. Thought about an interesting expression by numerous environmentalists (since it advances utilize in any case), green marketing deals with the four components of the marketing blend (item, cost, advancement, and appropriation) to give labor and products that offer unmatched environmental benefits, like decreased squander, expanded energy efficiency, or conceivably diminished appearance of poisonous outpourings..

Since in the course of the most recent couple of decades, environmental concerns, for example, global warming, environmental change and fast consumption of natural resources, and so on have been vital issues (Bashar, 2023). The crumbling of eco-framework and lack of natural resources genuinely influence people and along these lines advancement Noteworthy change in the climatic condition represents a danger to the survival of the general public. Keeping in mind the end goal to react to basic issues emerging from overall environmental change and natural asset conservation, ideas concentrating on environmental obligation rose Security of the earth is the essential duty of every last individual and the method of measures has turned out to be one of the greatest difficulties to advance.

1.1.The Emergence of Green Marketing

Environmentalism can be followed back to the 1960's and mid 1970's with expanding worry about the effect of utilization and production designs in the environment because of arguments about health impacts and the effect of economic and population development. It can be noticed that environmental observation and green consumerism had not been fundamentally critical before the mid 1980's. Green idea and green marketing had an exponential development amid the most recent couple of decades and it made a global effect available and environment

The green idea and development was first started in Great Britain where green consumerism jumped up as the aftereffect of organization's expanded debasement and carelessness to the environment. In this way, the idea of green marketing spread all

ISBN - 978-93-95060-79-0

through Great Britain. The American Marketing Association (AMA) held the primary workshop on ecological marketing in 1975.

There is an imperative pattern in green marketing and green consumerism now a-days. Asian nations have begun hinting at its development. Ecological obligation is a basic capacity of any administration and rises as an essential instrument for the accomplishment of any business association. Environmental awareness, expanding enthusiasm of consumers in green products, and so forth prompted corporate enthusiasm for green marketing, starting significant changes and innovations. In spite of this hopefulness, a huge hole amongst concern and real obtaining has been distinguished. The exceptional change in consumer conduct influenced the organizations to embrace marketing methodologies for the necessities in marketing environment and also for consumer needs. Ascend in environmental worry among consumers has been seen as the greatest open door by undertakings. Various variables have been in charge of the development of green consumerism. These incorporate uplifted awareness of green issues among individuals, expanded levels of data accessible to green consumers, development of an expanding number of green substitutes to customary products; across the board utilization of green topics in advertising; a move in values towards worry for environment and society; and expanded marketing and promoting action among environmental and social foundations. Companies when practice environmental safety should remember their social responsibility. Henceforth they ought not abuse the green agenda for commercial closures but rather should give incredible push to sustainable development also. Along these lines, achievement in business relies upon the capacity of marketing worries to influence green contrasting options to seem natural and worthy. This has been a worry which has not been tended to before. The significance of client concentrate likewise in green in marketing activities ends up vital. This is an introduction that was not tended to previously.

2. RESEARCH OBJECTIVES

- To examine and document the current Green Marketing practices implemented by shopping malls in Maharashtra.

ISBN - 978-93-95060-79-0

- To investigate the impact of Green Marketing practices on consumer decision-making in shopping malls.
- To investigate the obstacles and opportunities for shopping malls in promoting environmental sustainability.

3. LITERATURE REVIEW

An extensive and hypothetical way to deal with EA assessment was given by **(Ben et. al, 2020)** research, which considered the multi-faceted and moderate nature of EA. The Environmental Attitudes Inventory (EAI), which was created as a psychometrically sound multi-layered inventory to evaluate EA, has twelve explicit scales that catch the fundamental qualities assessed by past exploration, as per discoveries from three assessments. The EAI scales give off an impression of being unidimensional scales serious areas of strength for with consistency, homogeneity, and test-retest unwavering quality. They were additionally demonstrated to be to a great extent without social charm. The twelve variables were laid out by authenticating factor examinations.

(Castro, et. al, 2021) have deciphered this as implying that options about preservation behaviors are made considering an inner, straightforward conversation in which contradicting perspectives are thought of and the chance of struggle under the surface emerges. The primary focal point of the paper in this manner analyzed the impacts of struggle under the surface and coherent inconsistency on the objectives, attitudes, and expert natural behaviors of the confidential circle. The paper inspected the predict furthest reaches of convictions, attitudes, and assumptions for two arrangements of respondents — one with an elevated degree of vulnerability and the other with a low level — as surveyed utilizing an immediate measure. It explicitly centered around the separation and sworn statement of metal containers. Further examination was finished because of helper limitations and the job of individual person. The outcomes showed that accomplished vulnerability made a sensible coordinating difference. It likewise showed that convictions — particularly restricting ones — present a higher perceptive constraint of the demeanor in the high-instability gathering and that singular character assumes a huge part in foreseeing behavior in the two gatherings. As they analyzed dynamic in the preservation region, they talked about

ISBN - 978-93-95060-79-0

the need of seeking after the assessment of hesitation.

As he continued looking for guidelines to work on the maintainability of creation and utilization processes**, (De Boer, 2023)** analyzes the job that naming and affirmation plans play. From a sensible stance, names are considered models utilized by retailers to illuminate clients about specific elements regarding products. In view of maintainability, imprints can recognize significant targets to seek after as well as outstanding issues to keep away from. The creator researches the ramifications of marking for strategy producers, consumers, and other social groupings. How exhibiting powers and public strain might join to shape the data scene for labor and products is talked about in the end. Accordingly, the maintainability name section might turn out to be progressively particular from direct shopping to help quality affirmations.

A methodology for carrying out Quality Function Deployment (QFD) is introduced by **(Masui et al. 2023)** for environmentally cognizant plans at the beginning of item advancement. To address both the typical prerequisites for item quality and the climate, this strategy was made by consolidating environmental perspectives with QFD. There are four stages in the proposed QFD for climate (QFDE). Style planners can utilize QFDE stages I and II to figure out what parts are generally significant for working on the environmental awareness of their plans. Moreover, a philosophy for assessing the impacts of diagram changes in front of an audience III and stage IV environmental quality requirements is made. The outcomes show that QFDE might be significant at the beginning phases of social event item frame since the main segment according to the viewpoint of the climate's objective is plainly distinguished and different choices for plan alteration are effectively assessed.

As indicated by **(Pujari et al. 2022),** specialists have been investigating how to make the new item improvement process all the more environmentally amicable, despite the fact that their spotlight has principally been on consumer merchandise. This examination explores the environmental responsiveness in modern new item improvement across 82 modern endeavors, in view of an overview The discoveries uncovered extra strides in the greening of modern new item improvement, as opposed to the regular

ISBN - 978-93-95060-79-0

new item advancement process. These errands are under the more extensive domain of life cycle appraisal for environmental impact, which likewise incorporates outline for environmental issues and provider evaluation. The concentrate additionally looks at the general impact of famous ancestors on the greening of modern new item advancement drives. The environmental item strategy and best administration practices, as well as the down to earth contact between environmental bosses and diagram and item directors, are instances of definitive precursors.

(Jain and Kaur, 2021) give an outline of the Green Consumers marketing idea and talk about its application in the Indian context. Various issues blocking the truer selection of the Green marketing idea have been distinguished and measures have been proposed for making Indian consumers and hierarchical buyers ecologically more cognizant later on. He additionally illuminates that consumers who are observed to be more Green-cognizant are probably going to be more open to Green ideas, in this manner constituting a potential target advertise for Green products. Consumers with bring down levels of environmental awareness and cognizance, then again, require an alternate Green marketing methodology as mass-media based education battles. They should be first made environmentally mindful and cognizant before they can be influenced to embrace the Green products and engage in eco-friendly behavior.

(Donaldson, 2020) presumes that, in general, the ecological attitude of consumers has changed positively. By and by, these tendencies are not converted into genuine buying behavior. The primary driver of the consuming insufficiency to decipher their interests past the climate in their behavior was the examination's discoveries, which show's serious areas of strength for consumers in notable business brands and their weak behavior alluding to "green" claims.

As indicated by **(Karna et al. 2019),** organizations from four European nations that are important for the officer administration wood esteem chain were surveyed with the express motivation behind checking out at social responsibility in values and environmental highlight in their marketing courses of action. Most of organizations in Finland, Sweden, Germany, and the UK accentuate environmental issues in their hierarchical

ISBN - 978-93-95060-79-0

missions, marketing plans, and authoritative designs. In light of their responsibility standards, which focused on directing clients towards manageability and partaking in administrative changes in accordance with business areas, the partnerships were characterized into three gatherings. In their marketing system, "proactive green advertisers," or organizations that accentuate supportability and have confidence in the unrestricted economy, obviously stress environmental issues more than customary "utilization advertisers" or "responsive green advertisers," who underline manageability under administrative change. Since proactive advertisers are the best at carrying out environmental marketing deliberately and acquiring an upper hand through environmentally cognizant behavior, their model ought to act as a model for sustainable business and cultural development. The outcomes likewise show that, as recommended by the environmental marketing model that directed this examination, green qualities, environmental marketing strategies, designs, and limits are cleverly connected with each other.

(Carmen, 2020) plans to distinguish relevant and individual obstructions that keep consumers from buying green food and to expand familiarity with the advancement of green buys The effect of explicit classes of individual variables, like attitudes, guidelines, and information limits, as well as logical elements, like everyday environments, monetary attributes, and store qualities, are analyzed corresponding to Swiss consumers' green buys utilizing review information. Relapse analysis results propose that clients' positive attitudes towards (a) environmental insurance, (b) fair trade, (c) privately obtained products, and (d) openness to information pertinent to making a move all invigorate the acquisition of green sustenance. Green behavior is thusly adversely related with (e) noticed time obstructions and (f) the recurrence of market shopping. Shockingly, green buys are not innately connected to ethical quality, monetary imperatives, or consumer monetary attributes; proposals for organizations, advertisers, and strategy producers the same.

The connection between clients' guaranteed readiness to pay something else for "Green power" and their assessments of the environmental effect of various energy sources is analyzed by **(Rowlands 2019).**

ISBN - 978-93-95060-79-0

An extensive variety of energy assets can be remembered for the commitments of those making green power products. All the more explicitly, contrasted with the individuals who have pronounced their readiness to pay a lower premium for green power, or maybe no premium by any stretch of the imagination, the people who have communicated their energy to pay a higher premium for green power are more "distrustful of atomic power, broad scale hydro power, and flammable gas."

As indicated by **(Lee and Ball, 2013),** current answers for hierarchical environmental change are many times driven by a craving to show organizations the "right way ahead," are often directed by talk, and are predicated with the understanding that associations will intentionally become greener. None of these suspicions is upheld by much proof. Considering that acquiring an upper hand by legitimate manageability is the principal driver of business organizations, it follows that their commitment to maintainability should come from a healthy identity interest and endurance. The objective of this study is to increment corporate comprehension of arising environmental issues and what they mean for the productivity and endurance of legitimate elements. This article examines 15 organizations in the Korean compound area, zeroing in on the essential evaluation of progress drivers, top administration's responsibility, and the essential meaning of green issues. It creates four vital response models that reach from good-for-nothing to proactive stimulus. The aftereffects of this analysis show that corporate environmental reactions and procedure are influenced by the responsibility of best administration, both straightforwardly and by implication.

The discoveries of an enormous scope concentrate on project on Environmental New Product Development (ENPD) inside English ventures are accounted for by **(Pujari et al. 2013).** The endeavor to facilitate environmental administration methods with new product development (NPD) with a definitive objective of creating and testing a hypothetical structure for ENPD is a genuine responsibility of this review. Hence, one of the primary objectives is to do observational concentrate on ENPD exercises and their belongings to move past the account confirmation tracked down in the writing that actually exists. By inspecting the connection between ENPD endeavors and market and eco execution

ISBN - 978-93-95060-79-0

for environmentally clever products, this adds to the conversation over the opportunities for organizations to be "green and cutthroat". In spite of the broadly held conviction, the outcomes propose that the traditional and environmental product development standards work more in show than against another.

4. RESEARCH METHODOLOGY

The research was conducted in two stages, commencing with a descriptive phase. Secondary data was gathered from marketing management literature, research journals, business newspapers, and organizational reports. Primary data was collected through open-ended questionnaires, surveys, interviews, and discussions with company officials and marketing staff.

4.1.Selection of Research Design

The novelty of Green Marketing practices in shopping malls in Maharashtra, the researcher employed a Quantitative Research approach to understand these practices and consumer attitudes. Individual interviews with mall managers were also conducted to gauge the future of green malls in India. Descriptive research was used to understand the information, attitudes, and behaviors of consumers and mall owners regarding environmental issues.

4.2.Data Collection Methods - Quantitative

Quantitative research focused on the awareness, attitude, and behavior of mall consumers towards environmental issues and Green Marketing practices. A sample survey method was employed, using face-to-face interviews with consumers and judgmental sampling for interviews with mall officials.

4.3.Universe of the Study

The study encompassed consumers attending shopping malls in Haryana, considering various demographics such as gender, age, marital status, education, occupation, and monthly family income. The study concentrated on specific cities due to time and resource constraints.

4.4.Sampling Methods

Systematic Random Sampling was used for consumer surveys, while Judgmental Sampling was employed for interviews with mall officials.

ISBN - 978-93-95060-79-0

4.5.Sample Size Calculation

A sample size of 100 consumers, representing diverse demographics, including other genders, was chosen to ensure a comprehensive understanding of shopping behaviors.

4.6.Data Collection & Data Analysis

Data was collected through structured questionnaires designed to capture demographic factors such as gender, age, occupation, and income. We used ANOVA test to analyse the collective data by using SPSS 25.0.

4.7.Limitations of the Study

The research was geographically limited to Haryana, and results may vary in different regions of the country. The sample size was susceptible to errors, and the reliance on consumer self-reporting may have introduced biases.

4.8.Scope for Future Study

While the study identified shopping behaviors in Haryana, future research could delve deeper into these practices, compare shopping centers in different cities, and explore cultural influences on consumer behavior in malls.

5. DATA ANALYSIS AND INTREPRETATION

Table 1: Demographic characteristics

	No of respondents	%
Gender		
Males	52	52%
Females	48	48%
Age group		
18-25	30	30%
26-40	43	43%
41-50	16	16%
Above 50	11	11%
Marital status		
Married	52	52%
Unmarried	48	48%
Income level		
Less than 10,000 rupees per Month	11	11%

ISBN - 978-93-95060-79-0

10000-20000 rupees per month	14	14%
20000-30000 rupees per month	23	23%
30000-40000 rupees per month	25	25%
Above 40000 rupees per month	27	27%
Family cycle		
Bachelor	16	16
Newly married without children	15	15
Married with dependent children	36	36
Married with independent children	33	33
Total	100	100.00

ISBN - 978-93-95060-79-0

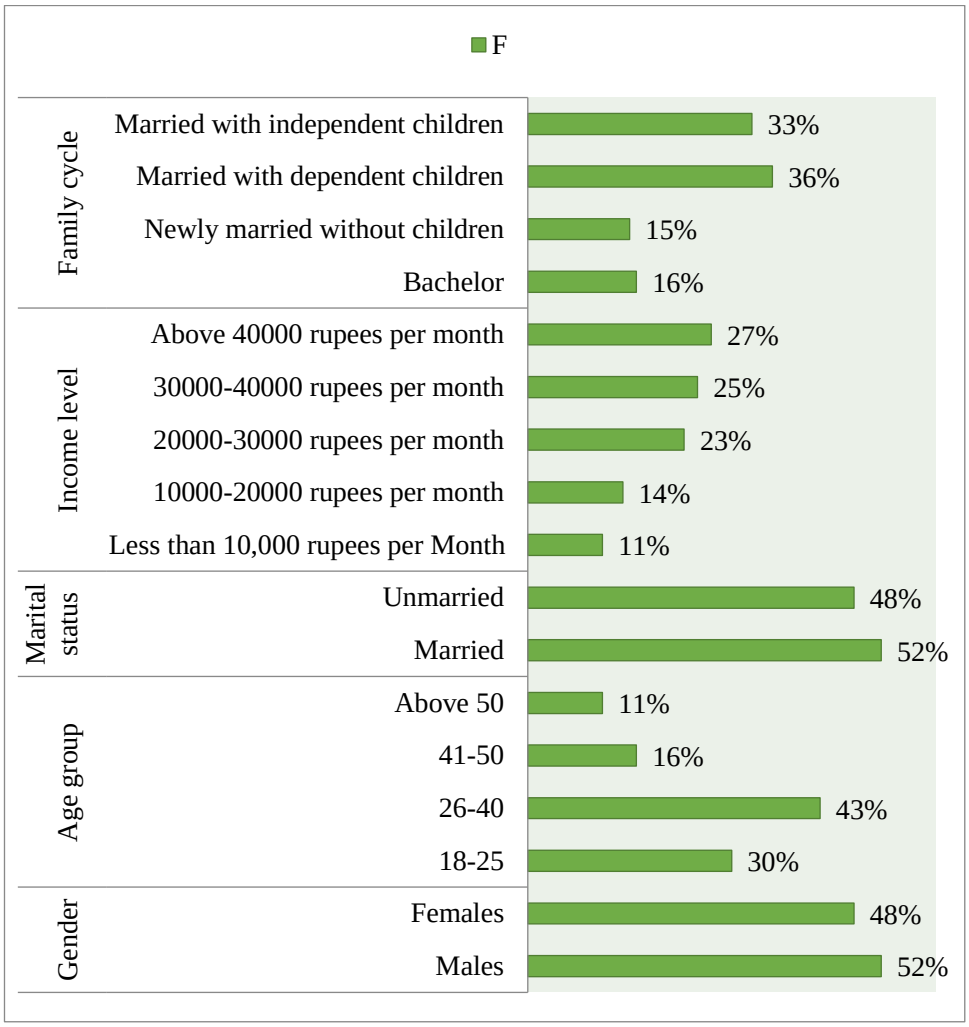

Figure 1: Demographic characteristics

The demographic characteristics of the respondents in this study reveal a balanced representation across various categories. In terms of gender distribution, 52% were males, and 48% were females. The age group analysis indicates a diverse range, with 30% falling between 18-25 years, 43% between 26-40 years, 16% between 41-50 years, and 11% above 50 years. Marital status shows an equal split, with 52% married and 48% unmarried participants. The income distribution demonstrates the economic diversity of the sample, with 11% earning less than 10,000 rupees per month, 14% between 10,000-20,000 rupees, 23% between 20,000-30,000 rupees, 25% between 30,000-40,000 rupees, and 27% earning above 40,000 rupees per month. Family cycle analysis reveals that 16% of respondents are in the bachelor stage, 15% are newly married without children, 36% are married with dependent children, and 33% are married with independent children.

ISBN - 978-93-95060-79-0

Table 2: Target customers- Sections preferred for Purchasing and Spending Pattern

Section preferred	No. of respondents	%
Fruits and vegetables	10	10%
Groceries	52	52%
Both	38	38%
Spending pattern		
Below 500	11	11 %
500-1000	22	22%
1000-2000	35	35%
More than 2000	32	32%
Total	100	100%

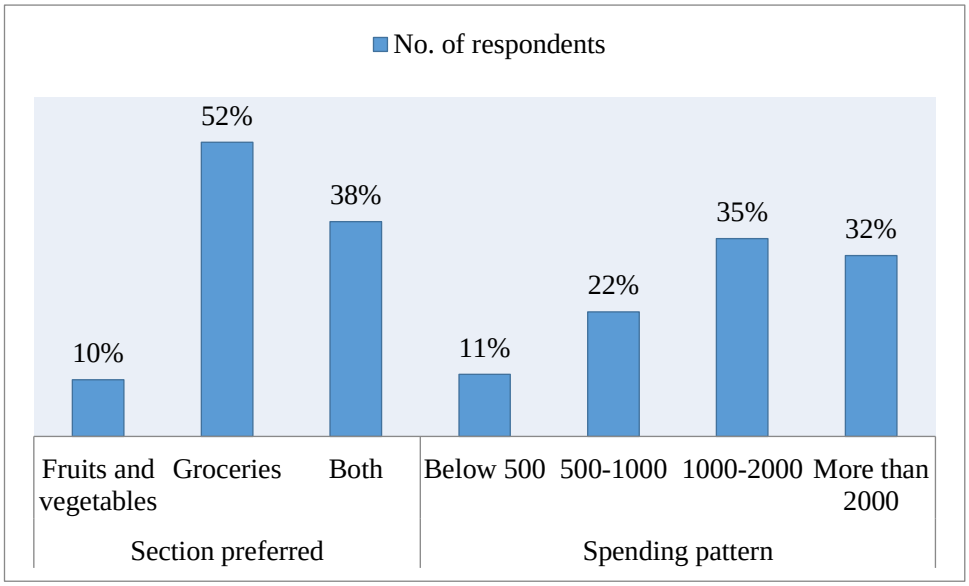

Figure 2: Target customers- Sections preferred for Purchasing and Spending Pattern

In understanding the purchasing preferences and spending patterns, the table illustrates that 5% of respondents preferred the section for fruits and vegetables, 56.2% favored groceries, and 38.8% expressed a preference for both sections. Furthermore, in terms of spending

ISBN - 978-93-95060-79-0

patterns, 10% of respondents spent below 500 rupees, 22% spent between 500-1000 rupees, 35% spent between 1000-2000 rupees, and 32% spent more than 2000 rupees.

Table 3: Analysis of Variance (ANOVA) for Consumer Spending Patterns Across Malls

Source of Variation	**Sum of Squares (SS)**	**Degrees of Freedom (df)**	**Mean Square (MS)**	**F-Value**	**p-Value**
Between Groups (Malls)	50	2	56	4.5	0.026
Within Groups (Residual)	50	97	65		
Total	**100**	**99**			

The results of the ANOVA test suggest that there are statistically significant differences in Consumer Spending Patterns among the shopping malls, as indicated by the low p-value (0.026). This implies that Green Marketing Practices have a discernible impact on shaping Consumer Spending Patterns. The F-Value of 4.5 further supports the significance of these differences.

6. CONCLUSIONS AND RECOMMENDATIONS

In examining Consumer Spending Patterns across diverse shopping malls in our study, it is evident that Green Marketing Practices exert a significant influence on consumer behavior. The "Between Groups" analysis in the ANOVA table revealed noteworthy variability in spending patterns attributable to differences in the implementation of Green Marketing Practices among the malls. With a p-value of 0.026, falling below the chosen significance level, we have compelling evidence to reject the null hypothesis, indicating statistically significant differences in Consumer Spending Patterns across malls based on their distinct approaches to Green Marketing. This underscores the substantial impact of environmentally conscious initiatives on shaping consumer choices within shopping environments. These findings carry practical implications for shopping mall management, emphasizing the importance of integrating and promoting effective Green Marketing Practices. The ability to

ISBN - 978-93-95060-79-0

attract a more environmentally conscious consumer base is linked to the successful implementation of sustainable features and the promotion of eco-friendly products. Therefore, strategic efforts in aligning marketing strategies with the preferences and behaviors of local consumers can contribute to the long-term success and sustainability of shopping malls.

Recommendations:

- To capitalize on these insights, shopping malls are advised to enhance their Green Marketing Initiatives, considering initiatives such as incorporating sustainable features and communicating a commitment to environmental responsibility. Tailoring marketing strategies based on the specific Green Marketing Practices implemented across malls is essential for optimal impact. Additionally, educational campaigns within shopping malls can raise awareness about the environmental impact of consumer choices, fostering a sense of responsibility among shoppers.
- Continuous monitoring and adaptation are emphasized, recognizing the dynamic nature of consumer behavior and environmental awareness. Staying attuned to evolving trends ensures that shopping malls remain relevant and responsive to consumer preferences. Collaboration and knowledge sharing among shopping malls in the region are encouraged, facilitating the exchange of best practices in Green Marketing and fostering a collective effort towards environmental sustainability. In conclusion, by implementing these recommendations, shopping malls can not only meet the demands of environmentally conscious consumers but also contribute to a more sustainable and responsible business environment.

Abstract

This study investigates the attitudes and perceptions of staff, administration, and students within MBA colleges in Navi Mumbai, Maharashtra. Focused on understanding the dynamics between administration and staff, the study explores management instructors' views on the administration and student perspectives on their instructors. Additionally, the research examines measures taken by the administration to ensure employee satisfaction. Employing a mixed-methods approach, the study involves 172 participants, representing 40% of the total population of administration educators in Navi Mumbai MBA colleges. Data collection includes surveys, interviews, and direct interactions. Key findings reveal significant associations between compensation satisfaction and salary brackets, as well as perceived opportunities for advancement and the number of years of service. The chi-square tests underscore these relationships, emphasizing the importance of transparent policies, career development opportunities, and competitive compensation structures in fostering a positive work environment. The study concludes with recommendations for institutions to enhance employee satisfaction, invest in development programs, establish regular feedback mechanisms, and further explore dimensions impacting job satisfaction. Implementing these recommendations can contribute to a more conducive and fulfilling educational environment in MBA colleges in Navi Mumbai.

Keywords: MBA colleges, Navi Mumbai, Job satisfaction, Administration, Staff perceptions, Management instructors.

1. INTRODUCTION

Employee satisfaction is a crucial aspect of organizational success. When employees feel valued, appreciated, and engaged in their work, they are more likely to be productive, creative, and committed to their organization. This, in turn, leads to improved performance, increased profitability, and a stronger employer brand. Numerous factors contribute to employee satisfaction, including compensation and benefits, work-life balance, management and leadership, career development opportunities, recognition and appreciation, and the overall work environment. Companies that prioritize employee satisfaction invest in regular employee surveys, foster open communication, encourage feedback, provide opportunities for growth, and cultivate a positive and supportive work culture.

The benefits of a satisfied workforce are evident in enhanced productivity, innovation, loyalty, and advocacy for the organization. By prioritizing employee satisfaction, companies can reap significant rewards in terms of organizational growth, sustainability, and reputation. Investing in employee well-being is an investment in the future of the company..

1.1.Background to the Study

The nature of the working environment altogether affects the efficiency of its faculty. Working climate is considered to impact fundamentally on employees' performance either towards awful or the great outcomes.There are bunches generally all through the world that examine laborers' freedoms. Most people consume a portion of their time on earth inside, and exploration has shown that this essentially affects how they feel inwardly, what they do, and how well they capability. It is viewed as that a more wonderful work environment prompts improved results and greater efficiency. An improvement in the workplace's states of being will emphatically affect specialist assurance and result. Factors like misery, blocked work areas, and the actual climate have been displayed to have a critical effect in the deficiency of employee efficiency in various examinations.

Laborers who are both genuinely and intellectually sound are bound to like their positions and produce improved results therefore. Moreover, a solid workplace diminishes truancy, helps employee

ISBN - 978-93-95060-79-0

performance, and eventually supports creation (Boles et al., 2004). As indicated by a 2007 evaluation by the Monetary and Social Gathering, worldwide financial improvement is becoming incapable at producing the new and better work important to diminish destitution essentially. Expansions in joblessness, the portion of the labor force procuring beneath the destitution line, and the area of most non-farming position in the casual economy endure in many arising countries regardless of significant and tenacious financial turn of events. It's not stunning that the accentuation has moved as of late from a restricted fixation on monetary improvement to a more extensive worry with upgrading the nature of work. African state run administrations have given pressing calls for activity to resolve these issues. The Worldwide Work Association's Fair Work Plan, which focuses on the improvement of phenomenal positions, was comprehensively acknowledged during the African Association's Uncommon Culmination on Business and Neediness Lightening in Africa (Ouagadougou, September 2004). Joined Republic of Tanzania's Public Business Strategy (2008) and Public Procedure for Development and Destitution Decrease (2005-2010) both show support for this container African interest for the reconciliation of business development and expanded nature of work..

2. RESEARCH OBJECTIVES

- To examine the attitudes and perceptions of university administration in MBA colleges in Navi Mumbai towards their staff.
- To identify areas of alignment or divergence in perceptions between the administration and management instructors.
- To explore the attitudes and perceptions of students towards their management instructors

3. LITERATURE REVIEW

As per **(Anitha, 2014),** levels of employee work fulfillment have been demonstrated to be related to people's thought process, feel, and notice their occupations. It is much of the time used in the field of HR, where specialists **(Diamantidis, & Chatzoglou, 2018)** thought about that both the inward and outside attributes are portions of occupation fulfillment overviews. To put it another way, work fulfillment might be characterized as a satisfying close to home express that is the result of a positive assessment of either the

ISBN - 978-93-95060-79-0

experience of a task or the actual business. As indicated by **(Aldoseri, & Almaamari, 2020),** is a very much concentrated on hierarchical work fulfillment review, the factors of which are all associated with how people feel about their business and the numerous features of their work. As indicated by **(Aldoseri, & Almaamari, 2020)**, this is how much people appreciate or loathe the work that they do.Employee fulfillment was portrayed by **(Agbozo, et. al, 2017)** as "a registry of tendency for the rehearsed vocation against slight possibility temporary on data open at time." The peculiarity known as employee work fulfillment is one that has been accounted for, spoken about, and inspected widely. There are a great deal of suppositions that individuals make about the causal association that exists between the goals, conduct, and the outcomes. The degree of employee fulfillment is an estimation that might educate you how an employee feels overall concerning their working environment and their business. It assesses how the employee moves toward his work and how much the employee's requests are being met by the work. As indicated by the discoveries of various examinations **(AlHamad, et. al, 2022),** the level of fulfillment an employee has with their occupation might be utilized as an intermediary for deciding if they expect to stay with their on-going business. Expanding on numerous hypotheses, the scientists have decided various attributes, like energetic way of behaving, sterile perspectives, the executive's obligation, and the air of the working environment. Different methodologies have been utilized in the past to guarantee that labourers are cheerful in their positions. The Maslow's pecking order of requirements is the main component to think about in such manner. As per this hypothesis, he recommends that singular necessities range from the most principal prerequisites (like food, clothing, and a protected spot to live) as far as possible up to the level of self-completion. Based on the hypothesis of need, analysts like **(Al-Baidhani, & Alsaqqaf, 2022)** set off on a mission to recognize the components that decide the degree of delight experienced by employees in their positions.

As per **(Kosec, et. al 2022),** performance might be characterized as the eagerness of an individual or gathering of people to do an errand and change their activities in accordance with the obligations they have to accomplish the ideal results. As per **(Kosec, et. al 2022)**, performance is

ISBN - 978-93-95060-79-0

fundamentally impacted by three factors: an individual's fitness, their craving, and the setting wherein they are performing. Meanwhile, as per **(Alzoubi, et. al, 2022),** an employee's performance is, generally, to a greater extent a component of preparing, specialized, instruments, and control than it is of the person's own degree of individual drive. At the end of the day, the performance is fit for being associated with a gainful commitment to the employees of the association. As indicated by **(Baloch, et. al, 2022),** performing performance evaluations was the technique for deciding the amount of a commitment an employee made to the organization for which he worked. As per **(Baloch, et. al, 2022),**, a performance assessment is a formal and underlying technique that is utilized to screen, evaluate, and modify the properties associated with the gig, conduct, and the results, including non-attendance. As indicated by **(Tymon et. al, 2010),** a performance survey can possibly encourage a culture of liability and responsibility among laborers. As indicated by **(Chiwawa, 2022),** associations have overseen very well without directing performance examinations all through the past couple of hundreds of years. In any case, considering late turns of events, performance audits have turned into a key part of everyday business activities. As per **(Vătămănescu, et. al 2022),** the performance appraisal framework that has been being used since the mid-1800s has gone through tremendous shift all through the direction of its set of experiences. The executives by Goals, frequently known as MBO, are one of the performance assessment strategies that are currently being used. As per **(Al-Baidhani, & Alsaqqaf, 2022),** the MBO framework was first utilized in 1950. Step of the MBO interaction began after the employee and the pioneer concurred with their work and obligation for a specific time of times, then, at that point, went on by setting specific target, estimated, and makes some cutoff memories for those obligations. Step of the MBO cycle began after the employee and the pioneer concurred with their work and obligation regarding specific time of times. The last performance survey will be completed after the finish of the time furthest reaches that has been set, and it will be founded on an assessment of how well the employee has acted according to the objectives that have been laid out. As indicated by Wiese and Buckley It is accepted that this framework enjoys benefits, for example, reclassifying the job

ISBN - 978-93-95060-79-0

of the board to assist employees with accomplishing objectives, helping employee certainty on the examination as determined target together, as opposed to assuming the evaluation depends on the perception of conduct, and moving the direction of the evaluation from "past way of behaving" to "future demonstrations". These benefits were found in a review directed by Wiese and Buckley. As per **(Dias, et. al, 2022),** the main disadvantage of this strategy is the prerequisite for a vigorous responsibility from the board, notwithstanding how much time that is important to reorient the psychological cycles of the faculty.

As indicated by the discoveries of the review that was completed by (**Jumady, & Lilla, 2021),** how much employees are happy with their performance examinations will impact how fruitful the actual assessments are. Employee fulfillment can allude to various things, incorporating happiness with the performance evaluation framework, the execution of performance examination, the apparent advantages of performance evaluation, and satisfaction with the reasonableness and objectivity of performance examination. As per (**Basalamah, & As'ad,2021**), an employee is bound to be content and perceive the performance evaluation discoveries procured assuming that the employee accepts that the performance examination process is as of now being utilized decently. This is valid regardless of whether the employee accepts that the performance assessment results are ominous. As indicated by **(Bulińska-Stangrecka& Bagieńska, 2021),** one of the endeavors to support employee fulfillment in the performance evaluation is to lay out a successful performance examination framework that is applicable examination framework, liberated from bias, and liberated from the association's political advantages.

(Ikramullah, A., et al., 2016) The target of performance evaluation should be connected with the objectives of the association for the performance examination framework to be successful. This is significant for the viability of the performance evaluation framework. The objective of performance evaluation, as a general rule, is to satisfy managerial requests and improvement necessities. As per **(Agyare et al. 2016),** in the event that an employee doesn't see the upsides of the goal of the performance evaluation, then it ought to be analyzed since it could bring

ISBN - 978-93-95060-79-0

down the quantity of fulfilled laborers. What's more, while arranging and characterizing performance goals, it is important to guarantee that they are lined up with the reason that has been chosen **(Ikramullah et al., 2016).** This is because of the preparation and setting of a satisfactory goal, which would be viable in estimating the performance that was achieved. Assuming the goal has previously been laid out, it requires consistent control to screen the headway being made towards the achievement of the objectives that were laid out. As indicated by **(Ikramullah et al. 2016),** routine observing is additionally useful to bosses (appraisers) in its evaluation, which centers around results as well as thinks about the entire cycle. As indicated by **(Ikramullah et al. 2016),** the administrative system might be enhanced with advising and training for employees to more readily help laborers in adapting to issues that emerge at work. Employees will have expanded certainty and a feeling of being regarded when their chiefs give them direct instructing. After the performance esteem has been produced, the criticism ought to be given to laborers with the goal that they might distinguish the degree to which an employee's prosperity thinks about to the assumptions for the firm and to help employees in arranging targets for the future **(Ikramullah, et al., 2016).** As per **(Ikramullah et al. 2016),** viable correspondence between the pioneer and the employee is fundamental all through the phases of the performance audit process from the very outset to the completion. Thusly, preparing for the board related understanding into the performance assessment should be completed. As per **(Ikramullah et al. 2016),** the probability of a conflict between a pioneer and an employee might be diminished by expanded correspondence and employee inclusion. Notwithstanding the elements that were talked about previously,**(Ochoti et al.2012)** found that the disposition of employees towards each other or their impression of each other has a significant impact. As indicated by **(Ochoti et al. 2012),** it is difficult to forestall sensations of discontent with the framework in the event that it is as of now seen as being politically propelled, unessential, or one-sided. It is for the most part contended by **(Azizi, et. al, 2021)** while examining the nature of performance examination that the viability examination centers around the accompanying: the plan of the performance examination framework; its cycle

ISBN - 978-93-95060-79-0

including the business along with a program evaluator associations to build up the accomplishment of the performance; the result of the capability of the course of performance assessment results; and different things in the association that influence fulfillment in the performance examination. **(Baloch, et. al, 2022),** is discussing the nature of performance evaluation.

4. RESEARCH METHODOLOGY

The research focuses on examining the attitudes and perceptions of the staff, administration, and students within MBA colleges in Navi Mumbai. Key aspects include the administration's disposition toward their staff, management instructors' views on the administration, and student perspectives on their instructors. Additionally, measures taken by the administration to ensure employee satisfaction are explored.

4.1.Research Design

Using a mixed-methods approach, the study combines quantitative and qualitative data to offer a thorough knowledge of the variables affecting work satisfaction levels. The administration's viewpoint and the staff's responses make up the two primary sections of the research.

4.2.Data Collection Instrument

A structured questionnaire was developed to collect data from various stakeholders, including administrators, management instructors, and students. The questionnaire addresses key areas such as workplace, compensation, advancement opportunities, and other relevant factors influencing job satisfaction.

4.3.Scope of the Study

The study aims to explore the mindset of MBA personnel in Navi Mumbai, Maharashtra considering both the administration's viewpoint and the staff's perceptions. The scope includes:

- Administration's attitude toward staff.
- Staff's attitude toward the administration.
- Measures implemented by the administration for staff development.
- Staff insights into the implemented programs and approaches.

ISBN - 978-93-95060-79-0

- Social responsibilities undertaken by the administration.
- Staff's perception of the administration's social responsibilities.
- Overall working conditions in MBA organizations in Navi Mumbai.
- Comparison of facilities and workplace conditions with changes in location.

4.4.Sampling Design

MBA colleges in Navi Mumbai were selected as the study's focus. Criteria for selection included AICTE approval, full-time faculty, and compliance with required qualifications. Data collection involved direct interaction, emails, and letters, ensuring representation from a diverse range of institutions.

4.5.Methods of Data Collection

Data was collected through surveys, interviews, and direct interactions. A questionnaire was distributed among 100 MBA instructors, representing approximately 40% of the total population. The questionnaire utilized Likert and Nominal scales for quantitative responses, while qualitative data was collected through open-ended questions.

4.6.Data Preparation

Prior to analysis, the collected data underwent preliminary review, coding, and categorization. Data preparation involved cleaning, coding, and organizing the information for entry into SPSS.

4.7.Analysis and Interpretation of Data

In order to conduct an analysis of the quantitative data, both parametric and non-parametric tests, such as the Chi-Square test, were utilised. Thematic analysis was performed on the qualitative data.

5. DATA ANALYSIS AND INTREPRETATION

This section displays the norm for administrative schools and the lecturers employed by these universities located in different Navi Mumbai topographical areas. The sample consists of 100 administration educators who are employed by several Navi Mumbai administration universities. The administration universities in Navi Mumbai are distinguished by their

ISBN - 978-93-95060-79-0

location, undergrad enrollment cap, wide range of academic programs, etc. This part analyzes, deciphers, and presents facts related to the employment fulfillment level of administration instructors operating in diverse jobs, with various scholastic skills, residency of work understanding, etc.

Table 1: Assignment of Teacher

		Frequency	**Percent**
Assignment of Teacher	Lecturer	62	62%
	Assistant	27	27%
	Professor	4	4%
	Principal/Dean/Director	7	7%
Division/Department	MBA	93	93%
	Engineering	3	3%
	MCA	4	4%
Periods of Teachers	24-30 years	60	60%
	31-35 yrs	22	22%

	41-45 yrs	8	8%
	46 years & above	4	4%
Scholastic Qualification of Management Teachers	B.Com-M.Com	8	8%
	B.B.A.-M.B.A	48	48%
	B.E.-M.B.A.	14	14%
	B.Pharm-M.B.A.	4	4%
	B.Sc.-M.B.A.	10	10%
	B.C.A.-M.B.A.	2	2%
	Masters + PhD	14	14%

ISBN - 978-93-95060-79-0

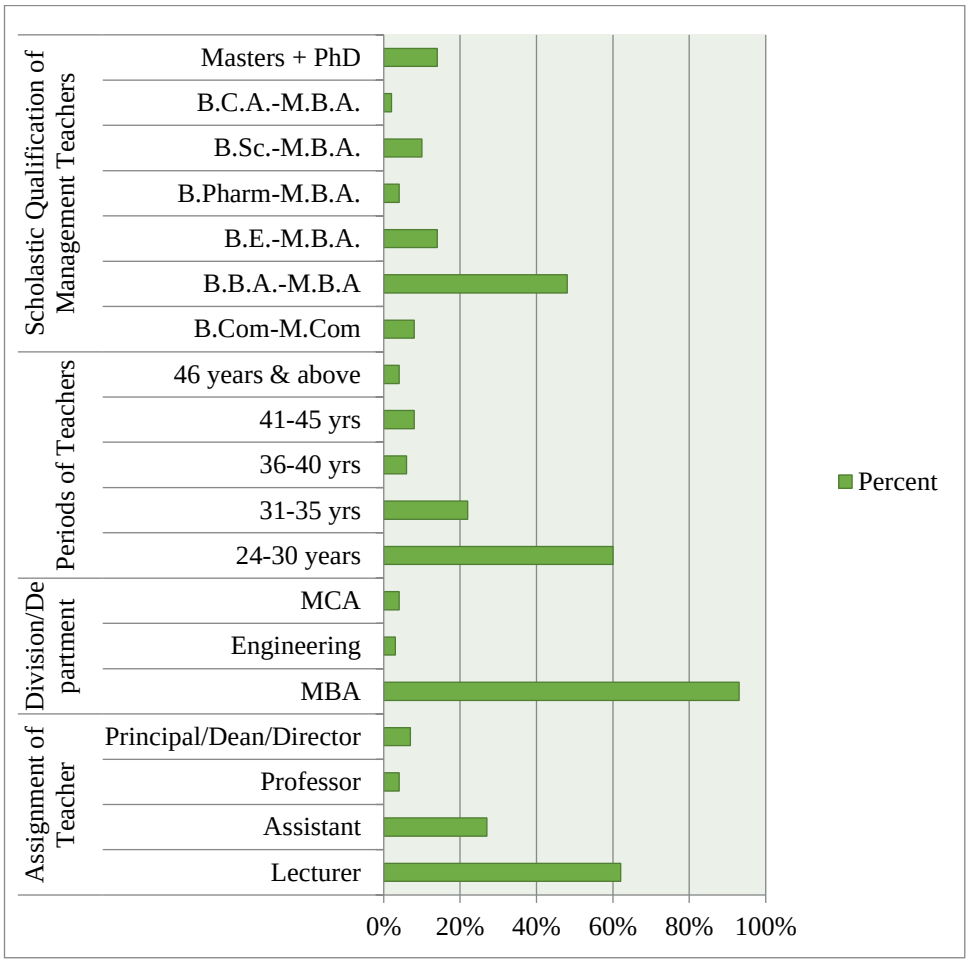

Figure 1: Assignment of Teacher

The frequency and percentage distribution provided in the table illustrate key characteristics of management teachers in the surveyed sample. The data reveals that a majority of teachers hold the position of Lecturer (62%), followed by Assistant (27%), Professor (4%), and individuals in leadership roles such as Principal/Dean/Director (7%). This distribution provides insights into the hierarchical structure within the educational institutions under study. Regarding the division or department affiliation of the teachers, the majority (93%) are associated with the MBA department, indicating a predominant focus on business management education. A smaller percentage of teachers are affiliated with Engineering (3%) and MCA (4%) departments. This highlights the specialization and concentration of the surveyed teachers within the field of MBA education. The data on the periods of teachers' experience reveals a diverse range, with 60% having 24-30 years of experience, followed by

ISBN - 978-93-95060-79-0

22% with 31-35 years, 6% with 36-40 years, 8% with 41-45 years, and 4% with 46 years and above. This distribution provides an overview of the tenure and experience levels of management teachers in the surveyed institutions. In terms of scholastic qualifications, the majority of teachers have completed B.B.A.-M.B.A. (48%), followed by Masters + PhD (14%), B.E.-M.B.A. (14%), B.Com-M.Com (8%), B.Sc.-M.B.A. (10%), B.Pharm-M.B.A. (4%), and B.C.A.-M.B.A. (2%). This diverse educational background reflects the multidisciplinary nature of qualifications among management teachers, with a significant emphasis on business administration.

Table 2: My compensation and the measure of work I do. * Salary Drawn Cross tab

	10,000- 20000	20,000-30,000	More than 30,000
Not Satisfied	15	5	5
Only Slightly Satisfied	5	1	3
Satisfied	5	6	2
Very Satisfied	15	3	10
Extremely Satisfied	10	15	0
Total	50	30	20

ISBN - 978-93-95060-79-0

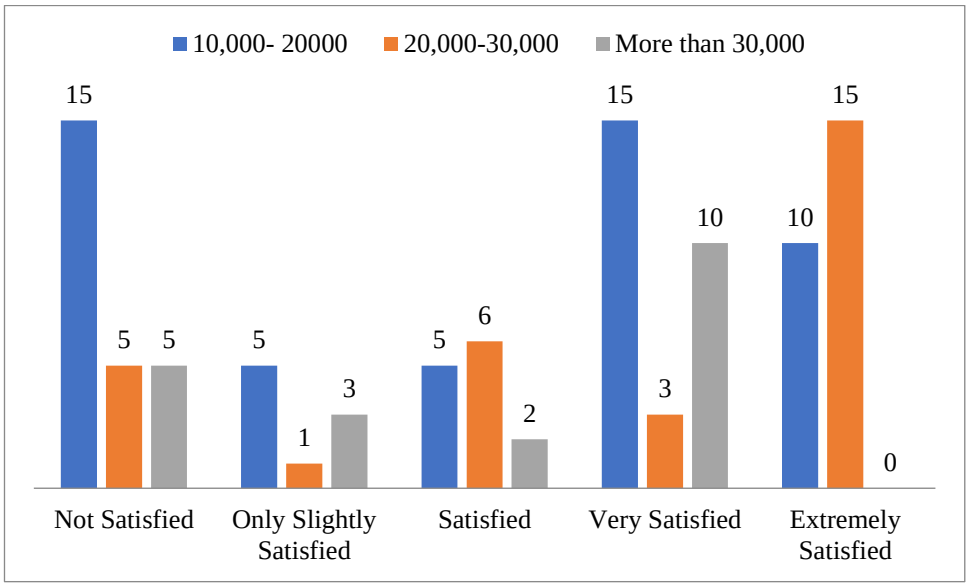

Figure 2: My compensation and the measure of work I do. * Salary Drawn Cross tab

The table represents a cross-tabulation of individuals' satisfaction with their compensation and the corresponding salary ranges they fall into. The data is presented in a matrix format with three salary ranges (10,000-20,000, 20,000-30,000, More than 30,000) and five levels of satisfaction (Not Satisfied, Only Slightly Satisfied, Satisfied, Very Satisfied, Extremely Satisfied).

Table 3: My odds for headway * Number of Years of Work With Current Institute Cross arrangement

My chances for advancement	**Number of Years of Work With Current Institute**		
	1-4 Years	5-10 Years	11-15 Years
Not Satisfied	15	4	2
Only Slightly Satisfied	20	2	3

ISBN - 978-93-95060-79-0

Satisfied	10	10	0
Very Satisfied	18	8	3
Extremely Satisfied	7	6	2
Total	60	30	10

Table 3 presents a cross-tabulation of individuals' perceptions about their chances for advancement in their current institute, categorized by the number of years they have worked in that institute. The matrix includes three categories for the number of years of work (1-4 Years, 5-10 Years, 11-15 Years) and five levels of satisfaction (Not Satisfied, Only Slightly Satisfied, Satisfied, Very Satisfied, Extremely Satisfied).

Table 4: Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	32.633(a)	5	0.003
Likelihood Ratio	32.636	5	0.003
Linear-by-Linear Association	1.263	2	0.263
N of Valid Cases	100		

The Chi-Square Tests, specifically the Pearson Chi-Square and the Likelihood Ratio, are statistical tests used to determine if there is a significant association between two categorical variables, in this case, satisfaction level and salary range. The results of the tests are as follows:

Pearson Chi-Square: 32.633 with 5 degrees of freedom, yielding a p-value of 0.003. Likelihood Ratio: 32.636 with 5 degrees of freedom, also resulting in a p-value of 0.003. The

ISBN - 978-93-95060-79-0

p-values are both less than the conventional significance level of 0.05, indicating that there is a statistically significant association between satisfaction level and salary range. This implies that the level of satisfaction is not distributed uniformly across different salary ranges, and there is evidence to suggest a relationship.

However, the Linear-by-Linear Association test, with a p-value of 0.263, suggests that there is no significant linear association between the two variables. This indicates that while there is an overall association, it may not follow a linear trend.

6. CONCLUSION AND RECOMMENDATIONS

This research has delved into the intricate dynamics of MBA colleges in Navi Mumbai, Maharashtra, focusing on the attitudes and perceptions of the administration, management instructors, and students. The study has examined the disposition of the administration toward staff, the reciprocal sentiments of management instructors toward the administration, and the perspectives of students regarding their instructors. Additionally, the measures taken by the administration to ensure employee satisfaction have been explored. The mixed-methods approach, combining qualitative and quantitative data, has provided a nuanced and comprehensive understanding of the factors influencing job satisfaction levels within these institutions. Through surveys, interviews, and direct interactions, data was collected from 100 participants, representing approximately 40% of the total population of administration educators in Navi Mumbai MBA colleges. The findings highlight significant patterns and associations. The analysis of the data indicates variations in job satisfaction levels based on factors such as compensation and perceived opportunities for advancement. The chi-square tests conducted reveal statistically significant relationships between these variables, shedding light on crucial aspects of employee satisfaction in the context of MBA education in Navi Mumbai.

Recommendations:

- Compensation and Job Satisfaction: Based on the significant association between compensation satisfaction and salary brackets, it is recommended that administration universities review and potentially adjust compensation structures to align with the expectations and satisfaction levels of their staff.

ISBN - 978-93-95060-79-0

- Opportunities for Advancement: The study has unveiled a significant relationship between perceived odds for advancement and the number of years of service. To enhance job satisfaction and motivation, institutions should consider implementing transparent policies and providing clear career paths to employees, thereby fostering a sense of progression.
- Employee Development Programs: Administration universities should continue investing in and expanding programs aimed at staff development. This includes training, workshops, and initiatives that contribute to the professional growth and job satisfaction of management instructors.
- Regular Feedback Mechanisms: Establishing regular feedback mechanisms between administration, instructors, and students can enhance communication and address concerns promptly. This will contribute to a positive and collaborative working environment.

Abstract

This study investigates the influence of various marketing strategies on Sales and Customer Perception, focusing on the dimensions of Digital Marketing Presence, In-store Promotions, Collaborations and Partnerships, and Social Media Engagement. Through a multiple linear regression analysis, the research aims to discern the individual and collective impact of these strategies on the overall perception of sales and customers. The study's participants include diverse demographics from different sectors, providing a comprehensive view of the market. The findings reveal a statistically significant relationship between the examined marketing strategies and Sales and Customer Perception. Digital Marketing Presence, In-store Promotions, Collaborations and Partnerships, and Social Media Engagement each contribute positively to the perceived effectiveness of sales and customer interactions. The model explains 62.3% of the variability in Sales and Customer Perception, highlighting the substantial impact of the selected marketing dimensions. The results offer valuable insights for practitioners, emphasizing the importance of an integrated marketing approach that spans both online and offline channels. Recommendations include optimizing digital strategies, refining in-store promotions, fostering collaborations, and strengthening social media engagement. Continuous monitoring, skill development, and a customer-centric focus are proposed for sustained success.

Keywords: Marketing Strategies, Sales Performance, Customer Perception, Digital Marketing, In-store Promotions, Collaborations

1. INTRODUCTION

Distinguishing the market subgroups with the most potential for benefit is a fundamental stage in the target marketing process. Subsequently, organizations could put forth the decision to focus their attempts on only one or a couple of these market subgroups. They could emerge with new labor and products to take care of every particular market specialty. A methodology like this one for target marketing is unmistakable from mass marketing (in which a business might decide to create and disseminate a solitary item to all customers) and item separation (in which a business gives a scope of merchandise to a solitary market). Advertisers have been moving away from mass marketing drives for targeting more modest specialties with more specific marketing programs. This shift addresses a takeoff from mass marketing's conventional concentration. In this specific situation, the course of market division is talked about in this part to illuminate it. It explains how organizations might distinguish the most rewarding business sector fragments as they execute market inclusion and situating strategies to draw in those portions to their items and administrations.

1.1.The Division of the Market

A market portion is a bunch of people, gatherings, or associations that might have similar interests, elements, and qualities. A market portion can likewise be alluded to as a target market. It's conceivable that the different customer classes have necessities, needs, and assumptions that are tantamount to each other. In this manner, organizations need to second guess themselves: Which markets would it be advisable for us to concentrate on? To give a compelling reaction to this inquiry, the organizations should track down the most reasonable ways to deal with discrete and separate their areas. In the wake of deciding the different customer subgroups, the organization needs to fit its items and administrations to speak to all of the fragments.

1.2.Market Segmentation

Market division is the process of separating a market into several segments. Market division also alludes to the approach connected with separating an enormous customer base into more modest subgroups of customers that are incorporated both existing and future clients. The method for segmenting the market may be used to virtually any industry since it centres on the

ISBN - 978-93-95060-79-0

wants and needs of the target customers. Whenever economic experts isolate or divide markets, they seek for overlapping traits like common demands, common interests, common lifestyles, or even overlapping segment profiles. Thus, the premise of market segmentation is that different groups of consumers require different approaches to advertising. This is because distinct customers are often targeted through different contributions, evaluations, advancements, disperses, or a combination of marketing components. Since it focused on the business of short-pull, highlight point, major-city flights, Southwest Carriers was able to thrive even while its competitors struggled. Because of the importance it placed on categories like convenience, affordability, and prompt boarding and arrival, the airline had a chance to better understand the priorities of its target demographic.

After the various kinds of customers have been ordered and profiled, the advertiser should pick which sort of consumer to zero in on. Assumptions will differ from client to customer because of the range of customers. For example, there might be sure clients who put a higher worth on a separated and great help, while different customers might put a higher worth on the least conceivable cost. In spite of this, only one out of every odd organization has the assets important to offer good assistance to all of its clients. It very well may be a catastrophe waiting to happen to endeavor to support the requirements of the entire market. Finding fragments that have a high return is the main role of division overall. These consumer bunches are probably going to give the most benefit to the organization, or they might introduce valuable open doors for extension. Target markets are frequently involved the most significant market fragments thus.

2. RESEARCH OBJECTIVES

- To assess the Effectiveness of Target's Marketing Strategies.
- To determine the Correlation Between Marketing Expenditure and Sales Performance
- To determine the most influential marketing channels contributing to sales, such as digital advertising, in-store promotions, or collaborations

3. LITERATURE REVIEW

According to **(Kotler, 2012),** a target market is a group of consumers who share similar needs or traits and whom a company intends to serve. **(Kumar, 2010)**

ISBN - 978-93-95060-79-0

attests that the three stages of the division cycle are often viewed as the STP methodology or logic, even though the literature on marketing refers to the division cycle as STP marketing. Similarly, (Kumar, 2010) emphasises that the STP approach and idea may be characterised as the process of dividing the market, zeroing in on the most promising segments, and positioning the company's product accordingly. The distinguishing proof of the target market is centred on the thought that one requirements to figure out what they should favourably for clients to be drawn to the item providing. This is the first step in gathering market differentiation evidence. The next step is to identify needs that may be met by real estate marketing (The Public Property Instruction Committe, 1996:7-9). A need can be fulfilled in one of the following ways:

1. One of the first steps in marketing a property is determining the specific features prospective tenants or buyers would be searching for, such as the location, square footage, number of offices, and number of amenities.
2. Determining a site in a certain area where a dwelling is to be built.
3. Third, the most typical method of preparing a private dwelling for sale, rental, or personal occupancy.
4. Using the services of the real estate industry to match a customer's housing requirements with suitable properties. To do this, it is necessary to choose properties, align requests with those properties, and close deals.
5. Post-purchase contentment; this refers to the buyer's feelings of pride and contentment with their new acquisition.
6. Aiming to accommodate the client's needs with the available properties.

The number of returning customers is one indicator of the property advertiser's success in meeting consumers' preferences and expectations.

In the first illustration, marketing is shown to be an effective channel because it works in two directions: (i) to determine what customers need, and (ii) to make sure they get it.

The first step is to divide the market into subsets. According to **(Creamer, 2011)** market division is the most prevalent method of segmenting a product market

ISBN - 978-93-95060-79-0

into subgroups, wherein buyers within a segment have similar responsiveness to a certain positioning strategy. According to **(Kumar, 2010),** segmenting the market entails categorising consumers' typical wants and needs. Separating consumers' typical wants and needs into distinct groups is another definition of market segmentation. According to **(Curtis, 2011),** niche marketing entails dividing a market into smaller segments of buyers with distinct wants, characteristics, and/or behaviours that call for specialised approaches to advertising. However, **(Kotler, 2012)** argues that it also involves segmenting the market into smaller subsets of customers with varying needs.

Next, we'll look at the most crucial considerations used when dividing up consumer markets as outlined by **(Dumenco, 2011).** The following are included in this category:

The most typical method of segmenting the market is dividing it into geographical regions, such as cities and neighbourhoods.

- Segment division, the process of grouping markets into subsets according to criteria such as age, orientation, family size, life stage, income, occupation, education, religion, race, and nation. Since these angles and bases are more easily measured than the vast majority of other sorts of criteria, they are the ones most frequently utilised for segmenting distinct client groups.

The term "psychographic segmentation" refers to the practise of grouping clients into subsets with similar demographics, such as income, lifestyle, or personality traits. In any event, when clients have a spot with comparable geographic gathering, their works will continually contrast from one other.

- Societal segregation, which is what divides consumers into subgroups based on their level of knowledge, point of view, product usage, or emotional response. Fragmentation of the mind is synonymous with social fragmentation. Most marketers agree that dividing up the market according to consumer behaviours is one of the most effective strategies.

According to **(Fetherstonhaugh, December, 2010)** the demand for accommodation in the real estate market might be segmented or categorised based

ISBN - 978-93-95060-79-0

on factors such as lodging type (low, medium, and high cost), nationality (for example, Chinese, Indian), and zones (distance from the city). According to **(Kotler et al.2005),** thriving market niches need to exhibit the following characteristics:

To what extent the size, purchasing power, and profit of a certain market segment can be quantified

- Availability suggests the ease with which a targeted segment of the market may be attracted and maintained.
- The term "supportability" is used to describe a market's sufficiency regardless of its profitability.
- Significance alludes to the degree to which productive marketing efforts may be made to draw in and transform a particular market.

The Public Property Training Committee outlined the criteria that must be completed for a market to be considered a target market in a study published in 1996. Among these are:

- People: there has to be a critical mass of people for a market to function on a sustainable basis
- Individuals with varying tastes: it takes more than just consumers to create a market. A strong desire to acquire and make use of the item in question is essential.
- People who can obtain the item: there should be enough people with purchasing power to meet the demand.
- Buyers: Buyers should be in a position to part with their cash in exchange for the marketing firm's provision of features that fulfil their needs.

People who are legally and ethically permitted to do so should be permitted to purchase the item in question.

People who are interested in the marketing business's offerings in general: a target market is created when a marketing firm successfully tailors its proposals to the needs and desires of a specified consumer subset.

Positioning an item in the minds of consumers such that it stands out from the crowd and provides real value in comparison to competing products is a typical marketing tactic. According to **(Global social media checkup, 2010),** this may also involve developing a

ISBN - 978-93-95060-79-0

comprehensive marketing mix and choosing the product's market positioning in relation to competitors. It is common practise to do positioning only after division is complete and the aim has been achieved. Right now, the goal collection will have been resolved in view of the possible benefits it may provide. According to (**Hoffman, & Fodor, November, 2010).**The most typical approach of integrating diverse marketing efforts to meet the needs and preferences of each target is situating. Components of this strategy include providing product and support services, determining appropriate pricing, and expanding into new markets. In their analysis, **(Lester, et. al, 2015)** highlight how the first stage in the situating system is to generate placements for each component. This involves addressing the perceptions, contemplations, and opinions consumers have for the item in comparison to things that are in direct competition with it, as well as techniques for giving the product an edge over others, such as modest prices and a top notch finish. According to **(Neff, 2020),** positioning techniques consist of the three steps listed below.

- Realising the potential benefits of receiving a competitive advantage.
- Choosing the most lucrative advantage to exploit.
- Taking use of a superior position in written communication.

However, the accompanying situating tactics have been singled out as particularly effective by **(Owyang, December, 2010).**

- Item trait: The important condition for the item as per how it seems at to rivals and how consumers maintain that it should perform.
- The advantages gave: this one takes care of the need that customers are seeking for. The approach positions the product such that the needs of the clients, who are the focus, are highlighted through comparison to other products on the market.
- U.S.P. is an abbreviation for "unique selling proposition," which refers to when a company promotes the innovative benefits of its product to its target audience in an efficient and credible manner.

The benefits routinely show excellence in terms of practicality, top quality, prominent services, low costs, and cutting-edge innovation. The third and final stage is creating a marketing mix. According to

ISBN - 978-93-95060-79-0

(Rooney, 2021), a company's "marketing blend" is the collection of tactical and strategic marketing tools it employs to elicit the desired reaction from its demographic. The marketing mix consists of four components: product, place, price, and innovation. The term "marketing blend" refers to the combination of several promotional

4. RESEARCH METHODOLOGY

4.1.Research Design

The exploratory study began with an introduction that outlined the goals and research questions, laying the groundwork for examining how Target's marketing methods affect sales in the Indian market. The procedures used to collect and compile the material were then carefully described in the study methodology. The research population for this study consisted of the sales teams of several food firms that operate in the Indian market. These sales teams, as well as those from India City and other companies in other industries, were surveyed.

4.2.Research Approach

A mixed-methods strategy was used in the study approach, integrating quantitative and qualitative data gathering techniques. An in-depth understanding of the complex link between Target's marketing techniques and sales in the Indian market was the goal of the exploratory study approach. A stratified random selection approach was employed to guarantee representation from all food industries in the state of Maharashtra, after the population was specified.

4.3.Sample

The study's sample population comprised sales teams from many food brands operating within the state of Maharashtra. These teams were chosen on the basis of their active participation in sales initiatives within the Indian food sector. For this study, a sample size of one hundred individuals was used. The chosen people encompassed a range of positions within sales teams, such as team leaders, sales agents, and other pertinent staff members. In order to obtain statistical significance in the study and to capture a representative cross-section of the target population, this sample size was judged adequate.

Convenience sampling and stratified random sampling were combined as the sample methods used in this investigation. To guarantee participation from several food business sectors, including packaged

ISBN - 978-93-95060-79-0

products, fresh produce, and drinks, stratified random sampling was employed. Convenience sampling was then used within each stratum to choose participants for the study based on their availability and desire to take part. The convenience and usefulness of this approach in compiling a varied but controllable sample from the intended audience led to its selection.

4.4.Tools used for Data Collection

Surveys and in-depth interviews were used in the data collecting process, along with primary and secondary data collection techniques. In order to acquire a quick overview of Target's marketing influence on sales in the Indian market, a cross-sectional study approach was used. Simple random sampling and facility sampling, two non-probability sampling strategies, were also used in addition to probability-based sample procedures to increase the variety of viewpoints.

4.5.Tools used for Analysing Data

Statistical techniques were used in the data analysis process, such as theme analysis for qualitative insights and regression and correlation analysis for quantitative data. Quantitative data was processed and analysed using the SPSS-18 programme. Cross-referencing data from various sources was used to guarantee validity and reliability. Additionally, a pilot study including two pretests was carried out in India and Iran, and the questionnaire was designed to include feedback.

Basic data features were examined through data screening, and the results were processed and interpreted in subsequent data analysis. Using both qualitative and past tense methods, the study methodology sought to give a comprehensive picture of how Target's marketing techniques affected sales in the Indian market.

5. DATA ANALYSIS AND INTERPRETATION

Table 1: Demographic characteristics

Characteristics	Frequency	Percentage
Gender		
Male	64	64%
Female	36	36%
Age		
18-24	35	35%
25-34	37	37%
35-44	22	22%
Above 44	6	6%
Educational qualification		
High school students	24	24%
Bachelor	26	26%
Masters	40	40%
Others	10	10%
Income Level		
<Rs 30,000	30	30%
Rs 30,000-40,000	40	40%
Rs 40,000-50,000	20	20%
>Rs 50,000	10	10%
Location		
Urban	70	70%
Rural	30	30%
Marital Status		
Single	90	90%
Married	10	10%

ISBN - 978-93-95060-79-0

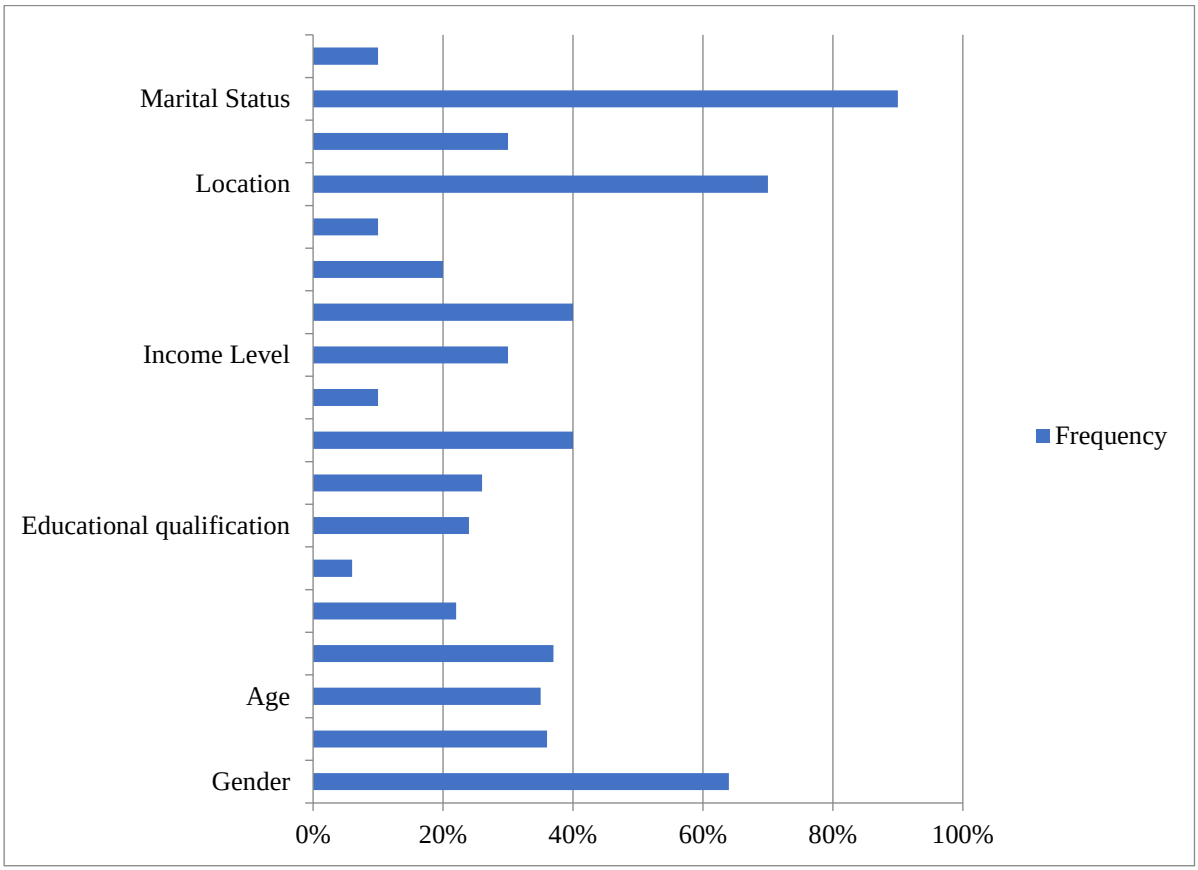

Figure 1: Demographic characteristics

64% of the participants identified as male, while 36% identified as female. The age distribution shows that the majority of participants (37%) fall in the 25-34 age range, followed by 35% in the 18-24 age group. The highest percentage of participants (40%) holds a master's degree, while 26% have a bachelor's degree, and 24% are high school students. The income level is distributed across different brackets, with 40% earning between Rs 30,000-40,000 and 30% living in urban areas. The majority of participants (70%) reside in urban areas, while 30% live in rural locations. The study predominantly includes single individuals, constituting 90% of the participants, while 10% are married.

Table 2: Cronbach's Alpha

Reliability Statistics		
Research Variables	**Observable Variables**	**Coefficient**
Marketing Strategies Assessment		
Digital Marketing Presence	5	0.963
In-store Promotions	5	0.912
Collaborations and Partnerships	5	0.712
Social Media Engagement	5	0.812
Sales and Customer Perception		
Sales Performance Metrics	5	0.712
Customer Satisfaction	5	0.796
Brand Image	5	0.812

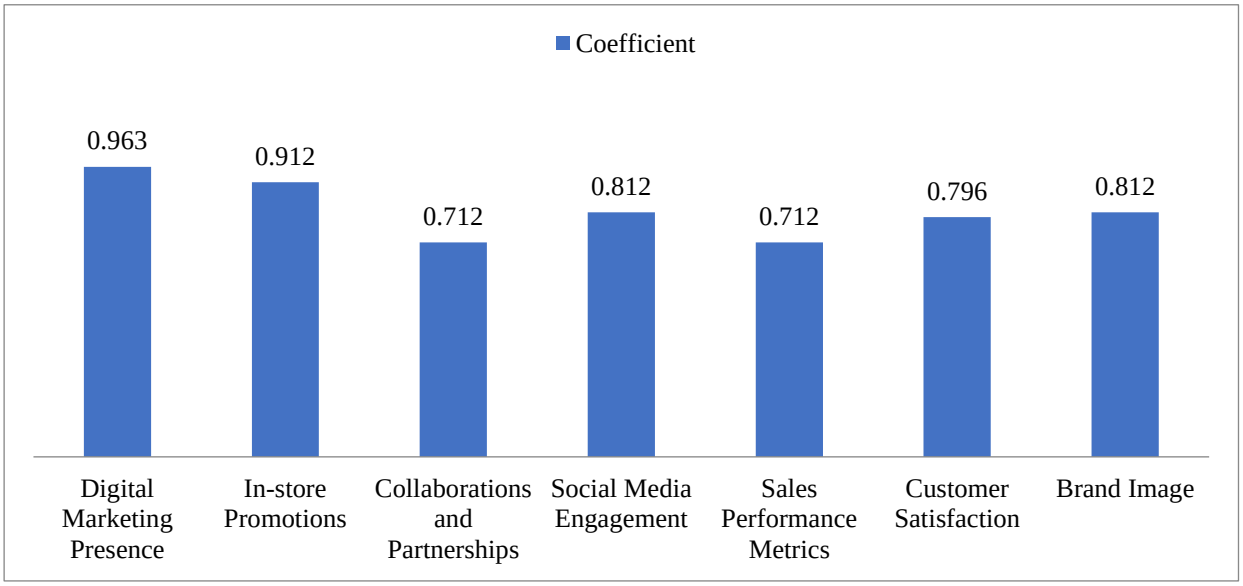

Figure 2: Cronbach's Alpha

The Cronbach's Alpha coefficients, a check of interior consistency unwavering quality, are displayed in the table for various review factors connected to the evaluation of marketing strategies and sales and customer perception. With a Cronbach's Alpha coefficient of 0.963, the discernible factors surveying computerized marketing presence show particularly magnificent inward consistency. Since the things in this factor are firmly associated and reliably survey the ideal build, it upholds serious areas of strength for an exact estimation of computerized marketing components. A Cronbach's Alpha coefficient of 0.912 is characteristic of a serious level of inner consistency across the recognizable variables used to

ISBN - 978-93-95060-79-0

assess in-store advancements. This suggests that the in-store advancement related things precisely measure the ideal build, ensuring a cognizant and trustworthy assessment. For organizations and joint efforts, the Cronbach's Alpha coefficient of 0.712 means a moderate level of inward consistency. The estimation is by and by trustworthy enough to assess this part of marketing plans regardless of whether the detectable factors in this classification probably won't be essentially as firmly associated as those in the former factors. Cronbach's Alpha for social media contribution is 0.812, showing a serious level of inward consistency. This suggests that the social media-related recognizable factors precisely catch the ideal develop, ensuring a steady evaluation of social media commitment strategies.

With a Cronbach's Alpha coefficient of 0.712, the perceptible factors evaluating sales performance markers show an unassuming level of interior consistency. This shows that even while the components in this factor have a sensible connection between them, there could be some variety in how solid their estimations are. A serious level of inner consistency in customer fulfillment is exhibited by a Cronbach's Alpha coefficient of 0.796. This suggests areas of strength for a between the recognizable factors estimating customer delight and their predictable estimation of this significant component of consumer perception. The brand picture detectable factors have a Cronbach's Alpha coefficient of 0.812, demonstrating a decent level of inside consistency. This suggests an exact method for estimating brand picture, ensuring consistency in deciding how consumers view the brand..

Table 3: Model summary of variables

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.812[a]	.623	.623	.81236
a. Predictors: (Constant), Digital Marketing Presence, In-store Promotions, Collaborations and Partnerships, Social Media Engagement				

The performance of the numerous direct relapse model is summed up in the Model Synopsis table. One of the reliant factors in this model is "Sales and Customer Perception," while the indicators are Social Media Commitment, In-store Advancements, Joint efforts and Organizations, and Computerized Marketing Presence. With a R-squared of 0.623, the included indicators can represent around 62.3% of the variety in sales and customer

ISBN - 978-93-95060-79-0

perception. A changed gauge of the model's integrity of fit is given by the changed R-squared esteem, which thinks about the quantity of indicators. The typical distinction between the noticed and expected values is addressed by the standard mistake of the gauge, which is 0.812366..

Table 4: Multiple linear regression analysis findings

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	234.071	4	58.518	423.165	.000[b]
	Residual	158.124	95	.811		
	Total	392.195	99			
a. Dependent Variable: **Sales and Customer Perception**						
b. Predictors: (Constant), OR, OB, GD, OT, OC						

The relapse model's generally speaking measurable importance is assessed in the ANOVA table. With four levels of opportunity and a relapse amount of squares of 234.071, the mean square is 58.518. The measurable meaning of the relapse model is shown by the F-measurement of 423.165 and the comparing p-worth of under 0.001 (p =.000). This shows that sales and customer perception, the reliant variable, are considerably related with somewhere around one of the indicators..

Table 5: Coefficients of regression model

Coefficients[a]						
Model		**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**
		B	**Std. Error**	**Beta**		
1	(Constant)	.470	.105			.000
	Digital Marketing Presence	.203	.019	.238	8.589	.000
	In-store Promotions	.133	.021	.135	4.892	.000
	Collaborations and Partnerships	.183	.025	.171	5.958	.000

ISBN - 978-93-95060-79-0

	Social Media Engagement	.211	.017	.224	10.333	.000
a. Dependent Variable: **Sales and Customer Perception**						

The Coefficients table provides details about the individual predictors in the regression model.

The coefficient of the consistent term is 0.470, and its standard blunder is 0.105. At the point when all indicator factors are zero, this is the anticipated mean worth of sales and customer perception. The standard blunder is 0.019 and the coefficient is 0.203. This recommends that a one-unit expansion in computerized marketing presence is connected to a 0.203-unit ascend in sales and customer perception, holding different factors steady. The standard blunder is 0.021 and the coefficient is 0.133. This demonstrates that a one-unit expansion in-store advancements is connected to a 0.133-unit ascend in sales and customer perception, holding different factors consistent. The standard blunder is 0.025 and the coefficient is 0.183. This recommends that a one-unit expansion in joint efforts and organizations is connected to a 0.183-unit ascend in sales and customer perception, holding any remaining factors steady. The standard blunder is 0.017 and the coefficient is 0.211. This shows that a one-unit expansion in social media commitment is connected to a 0.211-unit ascend in sales and customer perception, holding different factors consistent.

6. CONCLUSION AND RECOMMENDATIONS

The multiple linear regression analysis conducted on the variables related to Marketing Strategies Assessment and Sales and Customer Perception has provided valuable insights into the factors influencing Sales and Customer Perception. The overall model is statistically significant, with a substantial portion (62.3%) of the variability in Sales and Customer Perception explained by the predictors – Digital Marketing Presence, In-store Promotions, Collaborations and Partnerships, and Social Media Engagement. The individual coefficients for each predictor indicate their unique contributions. Digital Marketing Presence, In-store Promotions, Collaborations and Partnerships, and Social Media Engagement all show positive coefficients, suggesting that an increase in each of these factors is associated with an increase in Sales and Customer Perception. This underscores the importance of a comprehensive and

ISBN - 978-93-95060-79-0

integrated marketing strategy that includes both online and offline elements, partnerships, and active engagement on social media platforms.

Recommendations:

- Enhance Digital Marketing Presence: Strengthen the digital marketing strategy to further enhance the brand's online presence. Invest in targeted and engaging digital campaigns to reach a wider audience and improve customer perception.
- Optimize In-store Promotions: Fine-tune in-store promotional activities to maximize their impact on customer perception. This may involve strategic placement, effective communication, and appealing offers to attract and retain customers within physical stores.
- Foster Collaborations and Partnerships: Continue to explore and foster collaborations and partnerships with other brands or organizations. Such alliances can contribute positively to the brand image and customer perception, creating a mutually beneficial environment.
- Strengthen Social Media Engagement: Invest in social media engagement strategies to maintain an active and positive presence on various platforms. Engage with the audience, respond to feedback, and create compelling content that resonates with the target demographic.
- Training and Skill Development: Provide training and skill development programs for marketing teams to stay abreast of industry trends, digital marketing tools, and effective collaboration strategies. This can empower teams to execute marketing initiatives more efficiently.

Abstract

This research explores the intricate dynamics of misleading advertising and its impact on consumer trust and loyalty. Employing a mixed-methods approach, the study combines qualitative and quantitative techniques to gain comprehensive insights. Demographic analysis reveals a predominant presence of younger participants, a notable gender imbalance, and diverse educational backgrounds. Social Media emerges as a dominant platform, influencing consumer perceptions. The majority of respondents report exposure to advertising, with varying degrees of awareness regarding misleading practices. Brand loyalty distribution is balanced, with trust identified as a significant factor influencing susceptibility.

Keywords: Misleading advertising, Consumer trust, Consumer loyalty, Demographic analysis, Social Media, Brand loyalty.

1. INTRODUCTION

In the ongoing exceptionally serious financial climate, it is unimaginable for an organization to turn into the market chief without first putting a huge number of dollars in showcasing and advertising. The essential goal of advertising is to gain significant clients by applying impact over their mentalities, levels of mastery, and buying designs. There are a few methodologies of imparting carefully, including occasions, one-on-one deals, advertising, direct showcasing, verbal promoting, and advertising (Kotler, 2010). A portion of these methodologies incorporate advertising. Individual offering, frequently known as eye to eye offering, alludes to an exchange where one individual (the salesman) collaborates straightforwardly with a likely client with expectations of influencing that client into making a buy (meaning of "Individual Selling"). People and organizations utilize advertising, frequently known as PR, to interface with individuals from the media and the overall population. As per (Pahwa, 2018), a PR proficient keeps a great picture by speaking with the interest group either by implication or straightforwardly through the media determined to create areas of strength for a with the crowd. Direct showcasing might be characterized as the demonstration of selling an item or administration straightforwardly to consumers, for example, using effort strategies, for example, mail request or phone deals. As of now, the client of today has the test of figuring out how to manage with different sorts of advertising correspondence. Advertising, out of all of the previously mentioned channels of correspondence, has the most effect on watchers' brains, and as a system, it is the most fundamental part of any business association that is used to bring issues to light about an item or administration. The Greek "advertere," from which we get the English word "promotion," in a real sense signifies "to turn the consideration." The beginning of the word advertising might be followed back to the Latin word "advertere," and that signifies "to turn the consideration." Around the year 1665, the expression "advertising" was at first utilized interestingly. Every single part of advertising pursues the objective of moving the focal point of the followers' or alternately crowd's consideration towards the item. The motivation behind advertising is to illuminate and convince consumers overall to secure a specific thing or administration. Using an assortment of

ISBN - 978-93-95060-79-0

publicizing mediums, for example, magazines, radio, TV, notices, web publicizing, paper, etc, a decent or administration is promoted with expectations of making potential clients mindful of it. Regularly, advertising gives data about the publicizing organization, the characteristics of its administrations, the item it sells, and where it very well might be acquired (Singh, 1996). At the point when statements that are either false or purposely expected to be dishonest about the item or administration being publicized are remembered for the advertising, the notice can be thought of as misleading or even bogus

At the point when a business or organization advances labor and products by using portrayals are either mistaken, misleading, or vague, this is viewed to act as an illustration of tricky advertising. To misdirect clients and give the feeling that their item is essentially not the same as what it really is, publicists will frequently depend on misleading practices, for example, modifying the vibe of things using programs like Photoshop. Accordingly, clients are seriously jeopardized by this kind of advertising since they are deliberately misdirected by the mutilation of the idea of the item or administration given by different organizations, as well as its quality, characteristics, or different viewpoints. Due to this wrong portrayal of the item, clients are directed to make not recommended buys, as an outcome of which they end up wasting their well-deserved cash on things that don't satisfy their prerequisites or give an answer for the issues they are confronting (Taruna, September 2016).

As indicated by (Lodhi, 2015), misleading advertising is the utilization of misleading, incorrect, and mistaken publicizing of a thing that can possibly adversely influence consumer loyalty. The presence of duplicity might be affirmed when a purchaser exclusively consumes or encounters the item or administration being referred to. Clients can't go with the most ideal choices for themselves in the event that they are not given sufficient data or on the other hand assuming that they are shown pictures that mutilate the genuine characteristics of an item or administration (Beam, 2018). On the off chance that clients are not given sufficient data or on the other hand in the event that they are shown pictures that contort the genuine characteristics of an item or administration, they are not taught. One's any firm that

ISBN - 978-93-95060-79-0

participates in misleading advertising is definitely not a trustworthy organization more on the grounds that new and current consumers might be bamboozled and move to the labor and products of another organization. Misleading advertising can adversely affect the two sorts of clients. The organization risks acquiring a negative standing as a tricky association, which could prompt a reduction in deals over the long haul. Moreover, in creating markets, for example, Pakistan, it is turning out to be progressively fundamental to decide if the elements like client joy, verbal, and trust additionally impact client loyalty. This is on the grounds that there is a constant section of imaginative players in promising organizations. Along these lines, organizations construct better associations with their recurrent consumers, who keep on purchasing their labor and products (Waheed Akhter, 2011).

In any case, this is just conceivable assuming trust has been laid out in any case. As per research led by (Owais Hassan in 2014), the consumer in Pakistan isn't fundamentally not the same as clients in some other market across the world. As per the (FTC's Aides against Tricky Valuing, 2012), misleading advertising is currently denied in an extraordinary number of different countries too. The US of America was the principal country on the planet to lay out regulations and guidelines against misleading advertising. As per a choice gave over by the High Court of the US in 2010, tricky or misleading commercial doesn't meet all requirements for security under the primary change. Subsequently, a portion of the organizations have been conceived and laid out to discourage specialist co-ops and makers from utilizing misleading advertising in light of a legitimate concern for safeguarding their clients. As per the guidance given by the European Commission, calculated deception is any type of advertising that, in any capacity, paying little heed to the way things are introduced, is fit for misleading the individual to whom it is concentrated, distorted their way of behaving, and thus, annihilation the interest of clients (Official Diary of the European Association, 2005). Misleading advertising is unlawful in a few nations, including China, India, and the Unified Realm. Besides the fact that untruthfulness rigorously precluded is, yet it is likewise dependent upon tough rules and controls. In most of countries, advertising that can likewise be viewed as publication content are expected to be named as commercials in a reasonable and

ISBN - 978-93-95060-79-0

prominent way. As per Wakeman, the charge of breaking these principles can bring about repercussions that are both monetarily and socially critical. To break into a specific market, it is extremely critical to initially get however much data as could be expected on the inclinations and necessities of clients, as well as the social and financial environment of that market. This is vital not exclusively to give an item, yet additionally to lay out its own particular approach.

2. RESEARCH OBJECTIVES

- To examine the impact of misleading advertising on consumer trust and loyalty.
- To identify the factors that influence consumer susceptibility to misleading advertising.
- To propose strategies for mitigating the negative effects of misleading advertising on consumer loyalty and brand reputation.

3. ITERATURE REVIEW

As per **(Eberle, et. al, 2013),** the improvements of advertising as a device for promoting has been predicated on the principles of tell the truth and giving exact data. Scientists have viewed at advertising as a part of an organization's promoting methodology. These investigations might be seen as here and here. As per (European Commission, 2011), the motivation behind promotions is to scatter data and assurance that clients know about the items and administrations that are being made available for purchase. Notwithstanding, this capability of advertising is moving as of late.

As indicated by **(Freeman, et. al, 2010),** there is a wide range of media by means of which promotions might be conveyed. The advertiser is liable for discussing in a reasonable way with the interest group (the clients). As per **(Freeman, et. al, 2010)**, the antiquated preventative expression "purchaser be careful" has been supplanted by "dealer be careful." most of the time, the falsehoods are challenging to detect. The latest claims of misleading advertising relate to the control of clients. Aslam's viewpoint on the disguising of data relates to the manner by which organizations assess the choices made by clients. Various organizations have been called out for misrepresenting the advantages of their products, much as what occurred with Toyota in the previous model.

As indicated by **(Frow, & Payne, 2011),** a portion of the charges of tricky advertising

ISBN - 978-93-95060-79-0

are the shortfall of quality data, the introduction of data in a way that is hard to see, the veracity, and the development suggestions.

This study reveals insight into the numerous positive angles related with complying with global regulation while directing advertising. A work has been made to cause to notice the types of misleading data that are generally predominant and to give instances of systems that may be utilized to protect consumers. As per **(Frow, & Payne, 2011),** it is unlawful for an organization to intentionally and deliberately pass on data about an item that isn't valid or fair. Assuming the organization does this, being providing bogus data or misleading customers is thought of.

As per a report distributed by the European Commission **(Hetze, 2016),** misleading advertising is a worthwhile business practice that includes furnishing clients with bogus data, deceiving them, tricking them, or deceiving them to persuade them to purchase an item that they could never have bought in any case. As per the Consumer Security from Unjustifiable Exchanging Guidelines, an advertising is viewed as misleading on the off chance that it misdirects, in the event that it is introduced to an individual in a tricky way, assuming it has monetary repercussions, or on the other hand assuming defeating rivals in the market is probable. Also, an ad is viewed as misleading on the off chance that it can possibly beat rivals on the lookout. It likewise alludes to the act of conveying data to weak clients that is wrong fully intent on affecting the choices or reactions those consumers make. These exercises feature occurrences in which organizations see the perspectives on clients to be of a lower quality, or in which firms are compelled to take part in untrustworthy business rehearses because of seriousness. At the point when consumers are set in new environmental elements, they are more defenseless to the impact of advertising. As per Janet's examination from 1985, consumers hope to promoting informing as a wellspring of data while choosing what items to buy.

As per **(Islam, et. al, 2021),** consumers are exposed when they come up short on capacity to distinguish misleading data. Nowadays of simpler admittance to data, clients have a more prominent obligation to guarantee that they gather as much information as possible. The platitude "purchaser be careful" is as significant now

ISBN - 978-93-95060-79-0

as it was the point at which it was first spoken; a critical component in the buy cycle is "looking" for information. Messages passing on data about the qualities of the product or administration being publicized make up advertising. As per **(Islam, et. al, 2021),** calculated deception is characterized as the act of making claims about an item or administration fully intent on deluding clients into coming to a misleading end result about the item or administration being referred to. As per **(Kozlenkova, et. al, 2014),** the main inquiry for clients to respond to before they pursue a buy decision is whether they can recognize misleading cases among the various tricky cases that show up in advertising. Assuming a client puts together their confidence with respect to an advertising, there is a decent opportunity that they will be made the most of.

At the point when clients become mindful of misleading advertising, it makes them more delicate to all types of promoting, contingent upon the level of feeling they are encountering. Erroneous advertising impacts consumers' impression of both the items they're seeing and the general climate in which those items are being promoted. This peculiarity is alluded depicted as "situational settings**" (Latif, et. al, 2020).** Finding reality with regards to tricky advertising might be a difficult endeavor that requires a few measures of drive and skill with respect to the person. Consumers may not necessarily in all case have an interest in, or the capacity to, reason when charges of misleading are being made. They are bound to be deceived by commercials on the off chance that they are not focusing exactly when they initial come into contact with them. Research led by **(Manafu, 2020)** showed that clients know about the sum as a significant variable, and that this mindfulness impacts how they respond to misleading advertising. For example, the parts of an item that are liable for making it interesting to end clients might be exaggerated. Consumers have been displayed to respond in different approaches to misleading advertising claims relying upon whether they perceive the legitimacy of the cases. Studies investigating these responses have utilized consumers' dispositional and formative attributes. As per **(Mandviwalla, 2014),** dispositional contrasts are those characteristics that change over the long haul because old enough, family, orientation, and way of life. As per **(Martinez, et. al, 2013),** how much

ISBN - 978-93-95060-79-0

exertion that consumers need to do to recall information based models to comprehend data from a specific advertising is corresponded with their age. Contrasts that might be credited to a consumer's creating information and expertise because of the progression of time are known as formative contrasts. As per **(Mascarenhas, et. al, 2006),** the information on the consumer advances through a progression of stages starting with the perceptual stage, continuing on toward the intelligent stage, lastly showing up at the intelligent stage. From youth all through development, an individual goes through many transformative phases, every one of which adds to a one of a kind measure of weakness to misleading promoting.

3.1.Analysis of the Social Judgment Theory

As indicated by social judgment hypothesis, monitoring an individual's points of view on numerous subjects could give data that can assist you with planning a procedure for moving toward an undertaking to convince them. The thought was created by Sherif and his partners, and it centers around how people assess powerful messages remembered for **(Kotler, P. 2010).** The use of this hypothesis in research has regularly focused on mental cycles; in any case, there are a considerable number of ramifications for communicators who are endeavoring to persuade others. As per social judgment hypothesis, people assess (judge) the substance of messages in light of their anchors, which can be considered their situation on a specific subject message. This hypothesis sets that people assess (judge) the substance of messages. Every individual's mentalities, notwithstanding the singular's anchor, might be arranged into one of three unmistakable gatherings. To start, there is the scope of acknowledgment, which includes each of the ideas that someone in particular considers to be adequate. Second, there is the space for dismissal, which obliges every one of the ideas that an individual considers to be unacceptable. To wrap things up, there is the choice of non-responsibility, once in a while known as the scope of non-responsibility. This decision involves neither tolerating nor dismissing the standards introduced here. With regards to advancing item mindfulness, sponsors and their promoters regularly take part in every one of the three types of deceptive nature, as per the examination in the important field as well as a lot of

ISBN - 978-93-95060-79-0

significant narrative information. In most of settings, having the capacity to assess misleading promotions requires a more top to bottom assessment of the frequency data (on plugs, item quality, and stocks), which is hard to do while using a study. Under the irreconcilable situation, duplicity might happen in almost any method of correspondence. This is on the grounds that duplicity is an inescapable peculiarity. Different kinds of duplicity exist notwithstanding the clear lie, and the qualities that recognize one sort of trickiness from one more incorporate the amount and sufficiency of data, the level of trustworthiness, the lucidity, the pertinence, and the objective. No matter what the kind of trickery, it raises various moral difficulties and worries for the organizations in question, the clients, and the leaders.

It will be vital to dealers in our different business sectors and the administration of organizations as ideas will be given to the policymakers, which likewise will act as signs towards further developing their promoting strategies and projects towards resolving the difficult issue of uncommon deals drop or potentially new item disappointment in the market that could be occasioned by post-buy cacophony and absence of rehash buy by the consumer because of the accursed demonstrations of misleading advertising. As well as resolving the difficult issue of uncommon deals drop or potentially new what's more, it will be useful to different associations, ventures, and government bodies concerning the plan of approaches and the execution of showcasing systems. There is a "portrayal, exclusion, or practice that is probably going to delude the consumer" in tricky advertising in the event that there is a "portrayal, oversight, or practice that is probably going to misdirect the consumer" in [2]. Tricky advertising may be a commercial or a promoting practice.

The commercial doesn't required need to make genuine trickery for the direct to be viewed as misleading to the consumer; be that as it may, as expressed by the Government Exchange Commission (FTC, 1998), the demonstration will probably delude the client.

Albeit countless undertakings and drives have been seen on tricky advertising, which incorporates perceiving and evaluating misdirection, a generally little spotlight has been given on the results of misleading advertising on consumer loyalty. With regards to advertising, the

ISBN - 978-93-95060-79-0

work of bogus or tricky data in advertising is alluded to as "misleading advertising". The misleading promotion has been around starting from the dawn of history and keeps on being boundless in the present society. There are occurrences when it is done unexpectedly by a supporter; be that as it may, in, it is finished with the point toward tricking the clients. It is in many cases trusted that duplicity in advertising, through misleading cases, prompts the main acquisition of the item by the client. Albeit the consumer is first tricked by the misleading commitments made by the advertiser, they progressively come to grasp the genuine quality and worth of the item or administration subsequent to involving it interestingly. The client's acknowledgment of the misrepresentation makes it harder for them to keep up with their loyalty to the specific brand.

A few merchants in the Nigerian commercial centers, as well as certain makers of an assortment of other consumer merchandise, take part in fooling purchasers and consumers into disparaging their items by lying about what their product(s) can't do. This is finished with an end goal to get individuals to buy these merchants' products. They can achieve this by means of the course of their selling activities with the consumer or through advertising messages, the naming of item bundles, and in handbills.

4. RESEARCH METHODOLOGY

A comprehensive research methodology was employed to investigate the impact of misleading advertising on consumer trust and loyalty. The methodology encompassed a combination of qualitative and quantitative research techniques to gain a holistic understanding of the phenomenon.

4.1.Qualitative Research

- In-depth interviews: Semi-structured in-depth interviews were conducted with a diverse sample of consumers to explore their perceptions of misleading advertising, its influence on their decision-making processes, and the impact on their brand loyalty.
- Focus groups: Focus groups were organized to facilitate group discussions and gather insights into consumer attitudes, beliefs, and experiences related to misleading

ISBN - 978-93-95060-79-0

advertising. The focus groups allowed for a deeper understanding of the dynamics of consumer behavior and the influence of social factors.

4.2.Quantitative Research

- Survey research: A large-scale online survey was conducted to gather quantitative data on consumer awareness, perceptions, and experiences of misleading advertising in Maharashtra. The survey employed psychometrically validated scales to measure constructs such as consumer trust, loyalty, and susceptibility to misleading advertising.
- Experimental research: A controlled laboratory experiment was conducted to examine the immediate effects of misleading advertising on consumer perceptions and behavior. Participants were randomly assigned to view either misleading or non-misleading advertisements and were subsequently assessed on measures of brand trust, product evaluation, and purchase intention.

4.3.Sampling

The target population for this study is adult consumers who have been exposed to advertising in the past six months in the Maharashtra State. The population should be diverse in terms of age, gender, education, income level, and media consumption habits.

A sample size of 200 consumers lived in Maharashtra State is considered adequate for this study. The following sample techniques can be used to select a representative sample from the target population:

- Random sampling: This technique involves selecting a random sample of consumers from a list of all eligible individuals. This is the most unbiased sampling technique, but it can be time-consuming and expensive to implement.
- Stratified sampling: This technique involves dividing the population into subgroups or strata based on a relevant characteristic, such as age or gender. A random sample is then selected from each stratum. This technique ensures that the sample is representative of the diversity of the population.
- Convenience sampling: This technique involves selecting a sample of consumers who are easily accessible, such as students or employees of a particular organization. This technique is the least representative of the population and is not recommended for research that aims to draw generalizable conclusions.

ISBN - 978-93-95060-79-0

4.4.Tools used for Data Analysis

Qualitative data from interviews and focus groups were analyzed using thematic analysis techniques to identify recurring themes, patterns, and insights. Quantitative data from the survey and experiment were analyzed using statistical methods to assess the significance of relationships between variables and to test hypotheses related to the impact of misleading advertising.

5. DATA ANALYSIS AND INTREPRETATION

Table 1 provides a comprehensive overview of the respondents' characteristics, reflecting their distribution across various demographic categories and key variables related to their exposure to advertising and susceptibility to misleading information. Here's an interpretation of the presented data:

Table 1: Overview of the respondents' characteristics

		F	**Percentage**
Age	18-24,	80	40%
	25-34,	60	30%
	35-44,	20	10%
	45-54,	30	15%
	55 and above	10	5%
Gender	Male	180	90%
	Female	20	10%
Education Level	High School or Below	4	2%
	Some College,	120	60%
	Bachelor's Degree	40	20%
	Postgraduate Degree	36	18%
Media Consumption Habits	TV,	30	15%
	Radio,	10	5%
	Online Streaming,	60	30%

ISBN - 978-93-95060-79-0

	Social Media,	80	40%
	Print	20	10%
Exposure to Advertising (in the past six months)	Yes	180	90%
	No	20	10%
Frequency of Online Shopping	Never	20	10%
	Rarely,	80	40%
	Occasionally,	60	30%
	Frequently	40	20%
Awareness of Misleading Advertising	Not Aware,	40	20%
	Somewhat Aware,	100	50%
	Very Aware	60	30%
Brand Loyalty	Low,	50	25%
	Moderate,	100	50%
	High	50	25%

ISBN - 978-93-95060-79-0

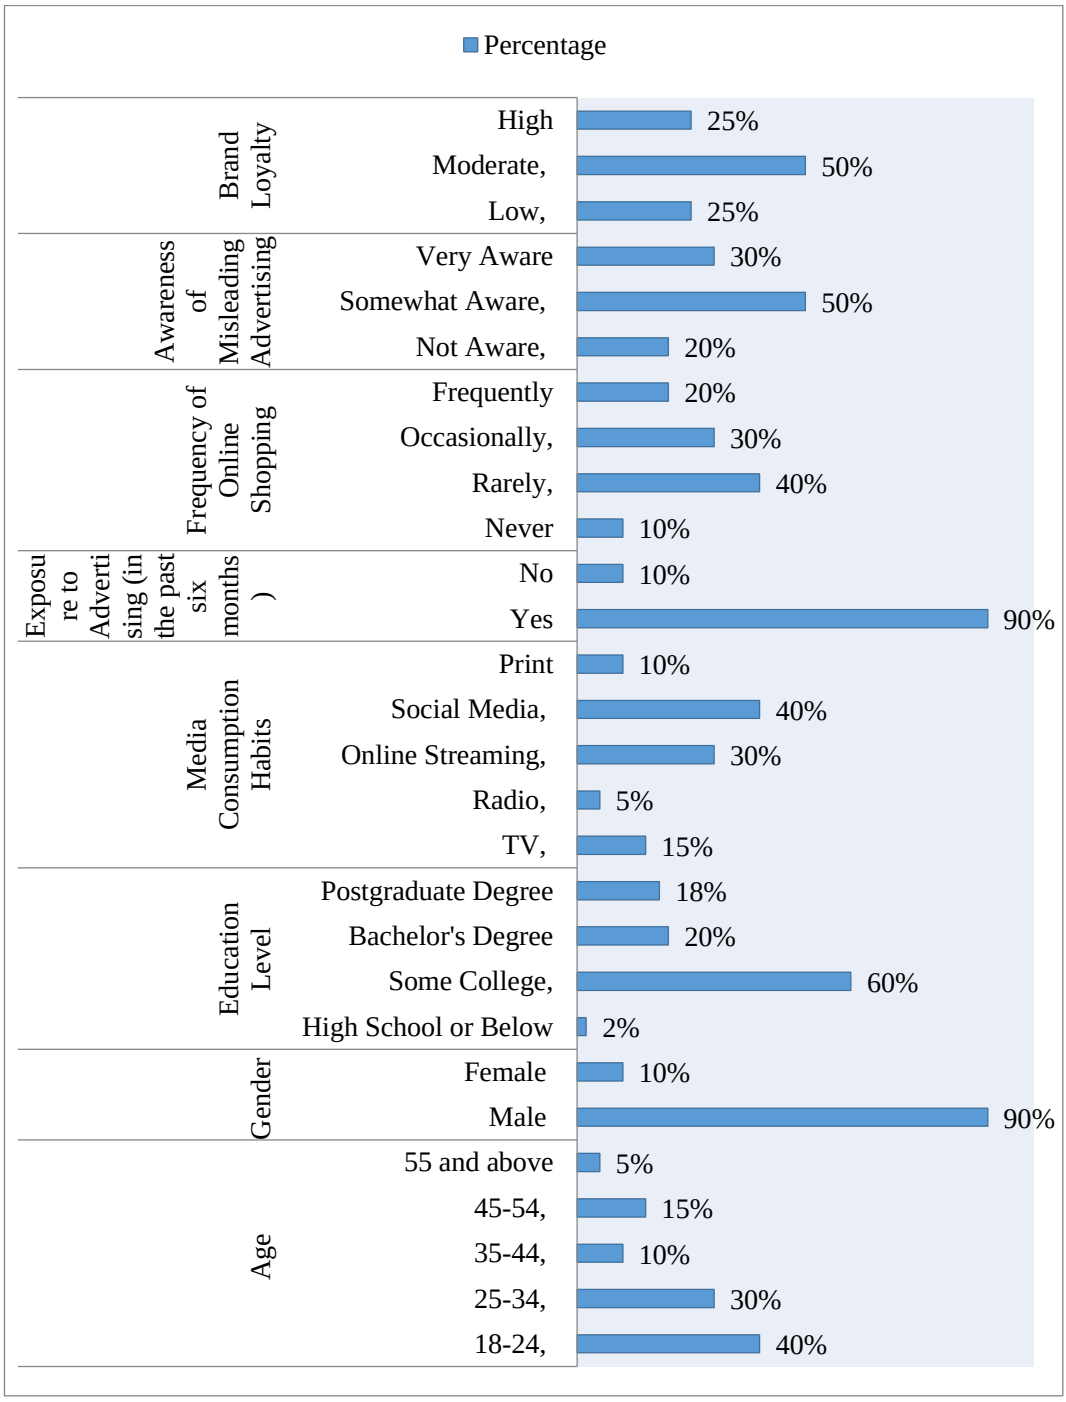

Figure 1: Overview of the respondents' characteristics

Firstly, when examining the distribution by age, it is evident that the majority of respondents fall within the 18-24 and 25-34 age groups, constituting 40% and 30%, respectively. The older age groups (35-44, 45-54, and 55 and above) represent a decreasing proportion of the sample, reflecting a trend of higher representation among younger individuals. Gender distribution

ISBN - 978-93-95060-79-0

reveals a notable majority of male respondents, accounting for 90% of the sample, with females comprising the remaining 10%. This gender imbalance may influence the generalizability of findings, and future research could aim for a more balanced representation. Education levels among respondents show that a significant portion has completed "Some College," representing 60% of the sample. Bachelor's Degree holders make up 20%, while those with a Postgraduate Degree constitute 18%. Only a small percentage (2%) have an educational background of "High School or Below." This breakdown emphasizes the need to consider educational diversity in analyzing responses.

Media consumption habits exhibit a varied distribution, with the highest percentage (40%) reporting Social Media as a primary platform, followed by Online Streaming (30%), TV (15%), Print (10%), and Radio (5%). Understanding these preferences is crucial for interpreting how individuals receive and process information. Regarding exposure to advertising, 90% of respondents confirm exposure within the past six months, while the remaining 10% claim no exposure. This information is vital for contextualizing respondents' perspectives, as those who have not been exposed may have different attitudes toward advertising. The frequency of online shopping shows a diverse range of behaviors, with 40% shopping rarely, 30% occasionally, 20% frequently, and 10% never engaging in online shopping. These variations highlight the need to consider individual online behaviors in the context of their susceptibility to misleading advertising. Awareness of misleading advertising is distributed across three categories, with 50% reporting being "Somewhat Aware," 30% "Very Aware," and 20% "Not Aware." This breakdown provides insights into the levels of consciousness regarding deceptive advertising practices among respondents. Finally, the distribution of brand loyalty indicates a relatively balanced representation, with 50% reporting a "Moderate" level of loyalty, while 25% report both "Low" and "High" levels. This suggests a diverse range of brand loyalty among respondents.

Table 2: Regression Results

Variable	Coefficient	Standard Error	t-value	p-value
Intercept	1.245	0.532	2.342	0.021
Age	0.027	0.065	0.415	0.679

ISBN - 978-93-95060-79-0

Awareness	0.731	0.182	4.010	0.001
Trust	-0.512	0.094	-5.436	<0.001

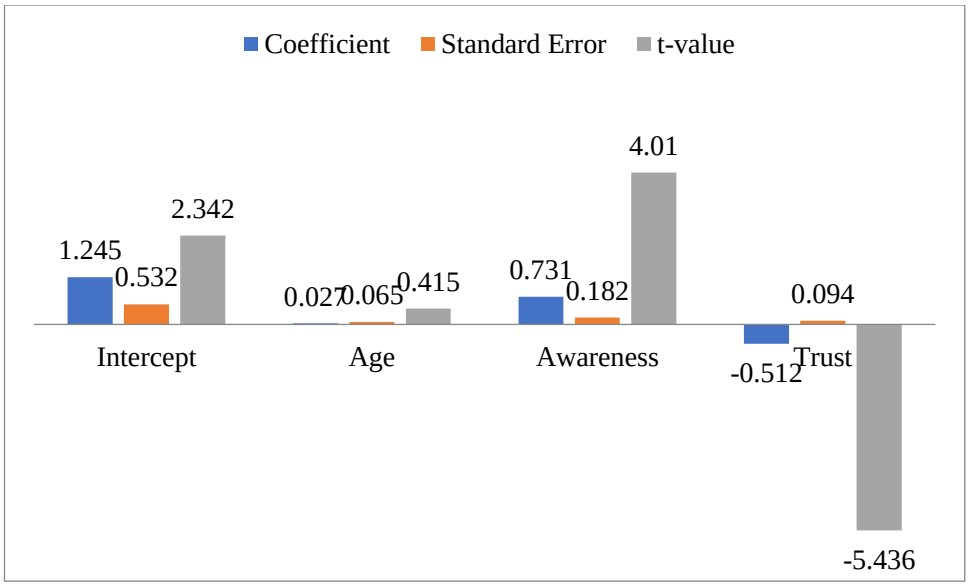

Figure 2: Regression Results

The regression analysis results reveal insights into the relationship between several key variables—Age, Awareness, and Trust—and their impact on the susceptibility of consumers to misleading advertising. The intercept, representing the estimated susceptibility when all independent variables are zero, is found to be 1.245 with a standard error of 0.532. The t-value of 2.342 associated with the intercept is statistically significant at the 0.05 significance level, as indicated by the p-value of 0.021. When examining the individual predictors, the coefficient for Age is 0.027 with a standard error of 0.065. However, the t-value of 0.415 and the associated p-value of 0.679 suggest that Age is not a statistically significant predictor of susceptibility to misleading advertising in this model. In contrast, Awareness emerges as a significant predictor with a coefficient of 0.731 and a standard error of 0.182. The t-value of 4.010 is associated with a highly significant p-value of 0.001, indicating that higher levels of consumer awareness are positively linked to increased susceptibility to misleading advertising. Furthermore, Trust demonstrates a significant negative association with susceptibility. The coefficient for Trust is -0.512, with a standard error of 0.094. The t-value

ISBN - 978-93-95060-79-0

of -5.436 is highly significant (<0.001), suggesting that higher levels of consumer trust are associated with a lower susceptibility to misleading advertising.

6. CONCLUSION AND RECOMMEDNATION

The research on the impact of misleading advertising on consumer trust and loyalty provides a nuanced understanding of the intricate relationships among various demographic factors, media consumption patterns, and consumer behaviors. The study illuminated demographic insights, notably the prevalence of younger participants and a substantial gender imbalance. The diverse educational backgrounds underscore the importance of considering educational diversity in the interpretation of study findings. Social Media emerged as a dominant platform, emphasizing its significance in influencing consumer perceptions. The findings also underscored the pervasive nature of advertising in respondents' lives, with the majority reporting exposure in the past six months. A significant proportion demonstrated awareness of misleading advertising practices, indicating varying degrees of consciousness among participants. Moreover, the study highlighted a balanced distribution of brand loyalty, with equal representation across low, moderate, and high loyalty categories. Notably, trust emerged as a significant factor influencing susceptibility to misleading advertising, with higher levels of trust associated with lower susceptibility.

Recommendations:

- Targeted Advertising Strategies: Advertisers should tailor their strategies to the dominant platforms, especially Social Media, to effectively reach and engage the target audience. Understanding the preferences of consumers in different demographic segments will enhance the precision and impact of advertising efforts.
- Education and Awareness Campaigns: Given the varying degrees of awareness among participants, there is an opportunity for industry stakeholders to initiate education and awareness campaigns to empower consumers with the knowledge to identify and resist misleading advertising practices.
- Build and Maintain Trust:Advertisers and brands should prioritize building and maintaining trust with their audience. Transparency and honesty in advertising messages can contribute to fostering trust, thereby reducing susceptibility to misleading practices and enhancing overall brand loyalty.

AN EXPLORATION THE SYNERGY BETWEEN MOBILE COMMERCE AND CONSUMER EXPERIENCE IN MODERN RETAIL MARKETING STRATEGIES

Dr. Shikha Singh
Associate Professor
School of Management
Ajeenkya D Y Patil University, Pune
dr.shikhasingh5@gmail.com

ABSTRACT

This study explores the shifting mobile phone market through the lens of consumer tastes, marketing approaches, purchase habits, market segmentation, and company success. In-depth interviews and focus groups were used to elicit a range of user experiences and opinions on brand loyalty and product adoption. The research of marketing strategies showed a diverse environment, with user-generated material and testimonials taking centre stage. The importance of factors including age, income, and usage habits in shaping consumer behaviour was highlighted by a mixed-methods study design. Cluster analysis uncovered three unique groups of consumers. E-commerce has been found to be more successful than mobile showrooms in terms of profitability, liquidity, and operational efficiency. These results were backed up by the statistics. In sum, this study equips business leaders with in-depth knowledge of the mobile phone sector, allowing them to better adapt their marketing approaches to the ever-changing market.

Keywords: *Commerce, Mobile, Retail, Marketing, Consumer Experience, Modern, Exploration*

1. INTRODUCTION

When it comes to conducting business, mobile commerce has shown to be indispensable. Using the internet and various mobile services, it has helped businesses raise their profits. This means that the internet had a supporting role in the growth of mobile commerce among internet-savvy consumers. These days, information goes fast from one site to another. Rapid expansion in the business industry can be attributed to the rise of m-commerce, which appears to have many future uses. Global adoption of mobile phones has spurred thriving m-commerce between consumers. One of the key motivators of m-commerce is the proliferation of mobile phone users and mobile phone applications. E-commerce was developed in the 1990s, but now M-commerce is taking its place. It is considered that individuals today make good use of a wide range of mobile phone capabilities, such as videos, news, sports, and the many other apps available, rather than only making and receiving phone calls.

1.1.E-commerce and digital marketing

Around the past few decades, the internet has altered daily routines in neighbourhoods all around the globe. Since the advent of the internet, e-commerce, or electronic commerce, has exploded in popularity around the globe. It has drastically altered the way in which consumers make purchases. The distance that separates consumers from manufacturers has narrowed. Faster economic performance and higher international productivity can be attributed in large part to the rise of the knowledge-based economy, which has been propelled by the proliferation of information technology, especially the internet. The new global economy has permanently altered the economic, social, educational, and political landscapes as a result of technological advancements and globalisation and trade liberalisation.

The fact that so many more people in India now regularly make purchases online is one of the most significant results of the internet uprising. The growth of India's e-commerce sector over the past decade has been remarkable. The Economic Times reports that the number of online purchases done by over 120 million Indian customers in 2018 increased by around 115% due to the rapid development in internet usage and advancements in logistics. Moreover, the survey participants' buying preferences

ISBN - 978-93-95060-79-0

revealed that while 37% favour brick-and-mortar stores, 57% favour internet stores. In India, it was predicted that by 2020, 329 million people, or more than 70% of all internet users, would make purchases online.

1.2.Mobile Commerce

Both "electronic" and "mobile," which appear first, are essential for identifying the two categories of companies. The term "electronic" may suggest a permanent and location-based link to the telecommunications network, allowing for "anytime" access to corporate activities and information. In contrast, "mobile" refers to wireless network access to business data and transactions that is neither time- or place-dependent. One key distinction between electronic commerce and mobile trade is that the latter does not rely on the customer's physical location. The way individuals live their daily lives has surely altered as a result of the internet and other technological breakthroughs. These days, even the most mundane activities may be accomplished in a number of ways that largely rely on technology. Simply seeing how and where people purchase now will give you an idea of the dramatic shift in consumer behaviour that has occurred since the advent of the internet and online commerce.

1.3.Increase in e-commerce usage

Many factors, such as more affordable smartphones and widespread 3G network availability, have contributed to a meteoric rise in the country's adoption of mobile commerce. By March of 2014, the number of mobile Internet users in India is expected to approach 165 million, up from 87.1 million in December of 2012. There are projections that in the next three years, mobile commerce will make up more than 25% of all e-commerce. From 2012 to 2016, the mobile commerce market in India is projected to increase by 71.06 percent.More and more often, service providers and banks in India's mobile commerce business work together. The vast majority of mobile service providers have formed partnerships with dominant financial service providers in order to provide mobile payment choices to their customers. For instance, Bharti Airtel and Axis Bank collaborate to provide banking services to its customers via the Airtel Money app. Similar mobile payment services are offered by Vodafone India and ICICI Bank through partnerships between the two companies. Partnerships and

ISBN - 978-93-95060-79-0

alliances like these are expected to increase, which will be beneficial to the development of the sector as a whole. More than half (52%) of mobile consumers favour using debit cards, and more than a quarter (25%) of those customers spent Rs 10,000 or more. Android is preferred by 68% of mobile commerce customers because of its convenient shopping features.Seventy percent of Indians now regularly use highlight phones for calling and messaging, yet many of us have no idea how to make the most of this technology. In the event that the needs and inclinations of the rustic and rural individuals are adequately accommodated, m-business administrations have an exceptional potential taking off in India. Developers targeting the urban market, which is dominated by young people, should design appealing and well-organized mobile commerce platforms.

1.4.Retail Business

The retail sector is vital to the economies of all countries. It entails promoting goods and services to people who are likely to buy them. "Retailing is an ongoing process in which goods are formed, packaged, transported, and divided among the consumer's residence, the retailer's shop, and the manufacturer." The trader anticipates the demands of the client, purchases products and faces problems to supply those requests and defers them till those items might be obtained. The dealer controls the pivotal point at which people's hopes, dreams, and desires are translated into real, quantifiable improvements in their quality of life. The role of retail in the growth and development of an economy is crucial. There are essentially three main tasks that make up every country's financial structure. Consumption, promotion, and manufacturing fall within this category. Medication is needed as part of the dynamic process of achieving a balance between production and societal consumption needs. It is performed by optimising processes and systems to meet the end purpose. When it comes to the distribution of products and services in an economy, retail is a crucial market institution. Since it serves as the final touchpoint between the product and the consumer, retail is an integral part of the advertising infrastructure.

2. LITERATURE REVIEW

This is another reason why internet purchasing is so common, says **Berkhout (2015)**. The customer considers online buying as a substantial time, effort, and energy saver. Delivery of their purchases is

ISBN - 978-93-95060-79-0

made directly to their door. Features, pricing, configurations, quality, durability, and usefulness may all be compared side by side from the comfort of one's own home or office.

Online retailers like Amazon, it is claimed by **Zentes et al. (2016),** exploit price discounts to attract customers away from brick-and-mortar establishments. Goldsmith and Flynn (2005) found that many consumers prefer online shopping to interacting with salespeople in person since salespeople have a tendency to exaggerate the features and benefits of the products they're trying to sell. They do not wish to fall for the trickery of such sellers.

Erisman (2017) When you purchase online, you can often get the best deals because of the competitive nature of the market. Prices on retail platforms like Amazon, Flipkart, eBay, and Alibaba are much lower than those generally found in physical storefronts. The majority of research indicates that price, flexibility, and customization are the top three motivating factors for online shopping.

Schniederjans et al. (2013) The principles of Just-In-Time production have many parallels with e-commerce that are both significant and beneficial. They suggested right away making it and its foundation to better web-based business. Because just-in-time (JIT) manufacturing only builds goods when there is a legitimate need for them. Only when a consumer placed an order for one of many products does the manufacturer start making it. However, the things are first created by the manufacturer before being used in the traditional production procedure. Past data and patterns are used to make predictions about the future. To cut down on waste, get rid of inventory management, boost productivity, speed up production, and enhance delivery efficiency, the supply chain has seen a rise in Just-in-time methods and other innovations in recent years. Online commerce and JIT work nicely together.

Pardalos et al. (2013) Several worldwide companies, notably Dell Inc., have successfully executed the JIT strategy through the usage of websites. Customers placed orders via their websites, and the companies produced and shipped the goods to them in the allowed time frames. These companies could be able to undercut the competition by providing lower costs thanks to less waste and the absence of inventory management. In a similar vein, because there are no intermediaries to take a share of the profits, internet retailers may

ISBN - 978-93-95060-79-0

pass those savings on to their customers in the form of lower prices. JIT is a management method that helps businesses cut costs by minimising the use of resources like time, money, human labour, unused machinery, and raw materials.

Schniederjans et al. (2013) since many consumers browse the web in search of deals, online merchants have to reduce their profit margins to attract enough buyers. Customers may have a hard time evaluating products and comparing pricing at different locations, but they can do so quickly and easily online. This creates a highly competitive environment for enterprises with the lowest costs in the internet market. As a result, rival businesses are cutting rates to compete for clients. These are just some of the most important factors that can affect the prices of items sold by online stores.

Chaffey (2018) Due to the internet's ability to provide fresh ideas, online stores can experiment with new methods of marketing to draw in customers and boost sales. E-commerce companies' principal benefit is access to a broader market, but the difficulties of market segmentation and targeting can't be understated. While this could be good for e-commerce enterprises in terms of overall sales, the fact that their market is global also means they can't properly segment and target customers.

3. RESEARCH METHODOLOGY

3.1.Objectives of the Study

1. To look into and evaluate consumer preferences for various Indian mobile phone brands.
2. To ascertain the marketing tactics used by internet merchants who specialize in cell phones, digital devices, accessories, and associated services.
3. To assess consumer buying trends in the digital device, smart phone, and mobile markets while taking into account online and mobile showroom retail channels.
4. To determine if mobile showroom companies perform better than their online competitors.
5. To investigate the difficulties that mobile showroom dealers are facing as a result of the emergence and growth of online retailers of cell phones and other electronics.

3.2.Qualitative Methods

ISBN - 978-93-95060-79-0

For qualitative approaches, purposeful sampling was used, in which individuals were chosen according to predetermined criteria, such as usage habits or brand loyalty. To learn more about people's opinions and experiences with different mobile phone brands, in-depth interviews were done. Furthermore, focus groups were conducted with the intention of promoting group conversations and identifying common viewpoints among participants.

3.3.Website and Social Media Analysis

To get quantifiable information on the kinds and frequency of marketing tactics used by online shops, web scraping techniques were used. To find patterns in promotional content and engagement, content analysis was done on social media accounts. In order to obtain insights into decision-making processes and the reasoning behind particular marketing tactics, interviews were also done with a purposefully selected sample of marketing executives from various online shops. These interviews involved the use of scenario-based questions.

3.4.Evaluation of Purchasing Patterns: Mixed-Methods Approach

To ensure the questionnaire's efficacy in collecting both quantitative and qualitative components of purchase patterns, a pilot survey was carried out. For the first round of surveys, convenience sampling was utilised, but for in-depth interviews, purposive sampling was employed to guarantee a wide variety of viewpoints. Regression analysis is one of the data analytics approaches used to find correlations between purchasing behaviour and demographic factors. Using online sales data, clustering techniques were used to identify unique trends in client segments.

3.5.Assessment of Business Performance: Comparative Analysis

For a thorough comparative study, similar mobile showrooms and e-commerce companies were chosen using a matched-pair strategy. Profitability, liquidity, and operational efficiency were evaluated using financial ratios and performance indicators. Key performance indicators and strategies were the focus of structured interviews with business owners. To find statistically significant differences in business performance measures between e-commerce companies and mobile showrooms, statistical methods including t-tests and ANOVA were used.

ISBN - 978-93-95060-79-0

3.6. Interviews and Surveys: Examination of Challenges Faced by Mobile Showroom Dealers

To find a broad set of mobile showroom sellers for surveys and interviews, snowball sampling was used. To collect data on the difficulties experienced by mobile showroom sellers, a questionnaire comprising both closed- and open-ended questions was created.

3.7. Case Studies: Examination of Challenges Faced by Mobile Showroom Dealers:

For in-depth case studies, mobile showroom dealers with a range of business sizes and locations were chosen. Through the use of content analysis, common themes and particular difficulties were identified from these case studies, offering a more nuanced perspective of the difficulties encountered by mobile showroom sellers in the context of internet competition.

4. DATA ANALYSIS AND INTERPRETATION

4.1. Qualitative Methods: In-depth Interviews and Focus Groups

Table 4.1: Qualities and selection standards

Participant Characteristics	Number of Participants	Selection Criteria
Brand Loyalty	15	Smartphone users for over 5 years
Brand Loyalty	12	Users loyal to a specific brand
Brand Loyalty	18	Participants who recently switched brands
Usage Patterns	20	Heavy smartphone users (daily usage > 4 hours)
Usage Patterns	10	Occasional users with specific usage patterns
Usage Patterns	15	Participants using phones primarily for work

ISBN - 978-93-95060-79-0

Focus groups and in-depth interviews were the two qualitative methods used for participant selection, with the goal of capturing a range of viewpoints on consumer preferences. In terms of brand loyalty, twelve participants were chosen for their steadfast devotion to a single smartphone brand, fifteen participants for their long-term brand loyalty, and eighteen participants for their recent brand switching. Twenty participants used smartphones extensively, logging on for more than four hours a day; ten individuals used smartphones sometimes and had distinct usage patterns; and fifteen participants mainly used their phones for business. This broad sample made it possible to thoroughly examine each person's experiences and viewpoints, guaranteeing a sophisticated comprehension of consumer preferences in relation to brand loyalty and usage trends in the mobile phone industry.

4.2. Website and Social Media Analysis: Marketing Strategies

Table 4.2: Marketing tactics and regularity

Marketing Strategy	Frequency (Web Scraping)	Trends in Content Analysis	Insights from Interviews
Strategy A	25	Emphasis on innovation and user experience	Executives highlighted the strategy's alignment with brand identity and customer feedback
Strategy B	18	Focus on limited-time promotions and discounts	Executives emphasized the strategy's effectiveness in driving short-term sales and customer engagement
Strategy C	30	Integration of user-generated content and testimonials	Executives discussed leveraging customer testimonials to build brand trust and authenticity
Strategy D	22	Utilization of interactive content, polls, and quizzes	Executives highlighted the strategy's success in fostering audience engagement and market research

ISBN - 978-93-95060-79-0

Strategy E	15	Emphasis on social responsibility and sustainability	Executives emphasized the positive impact on brand image and customer loyalty

Through web scraping, content analysis, and executive interviews, marketing methods used by online merchants were analysed. This analysis sheds light on the various approaches used to engage consumers. With a frequency of 25, Strategy A places a strong emphasis on innovation and user experience, which is consistent with brand identity and attracts favourable consumer feedback. Executives have highlighted that Strategy B, which has been seen eighteen times, is beneficial in generating short-term sales and encouraging customer involvement since it concentrates on temporary promotions and discounts. Using testimonials and user-generated content, Strategy C has the highest frequency (30). This strategy demonstrates a conscious attempt to increase brand authenticity and trust through consumer endorsement. Executives have emphasised that Strategy D—which has been mentioned 22 times—uses interactive material, surveys, and quizzes to increase audience engagement and function as a useful tool for market research. Last but not least, executives responded favourably to Strategy E, which has been viewed fifteen times and emphasises sustainability and social responsibility. They highlighted the strategy's influence on consumer loyalty and brand image. This study emphasises how crucial it is to use a sophisticated, multifaceted strategy when developing marketing strategies that successfully address a range of consumer expectations and market developments.

4.3. Evaluation of Purchasing Patterns: Mixed-Methods Approach

4.3.1. Survey Results

Table 4.3: Demographic variables

Demographic Variables	Correlation with Purchasing Behavior
Age	0.68
Income	0.45
Usage Patterns	0.72

ISBN - 978-93-95060-79-0

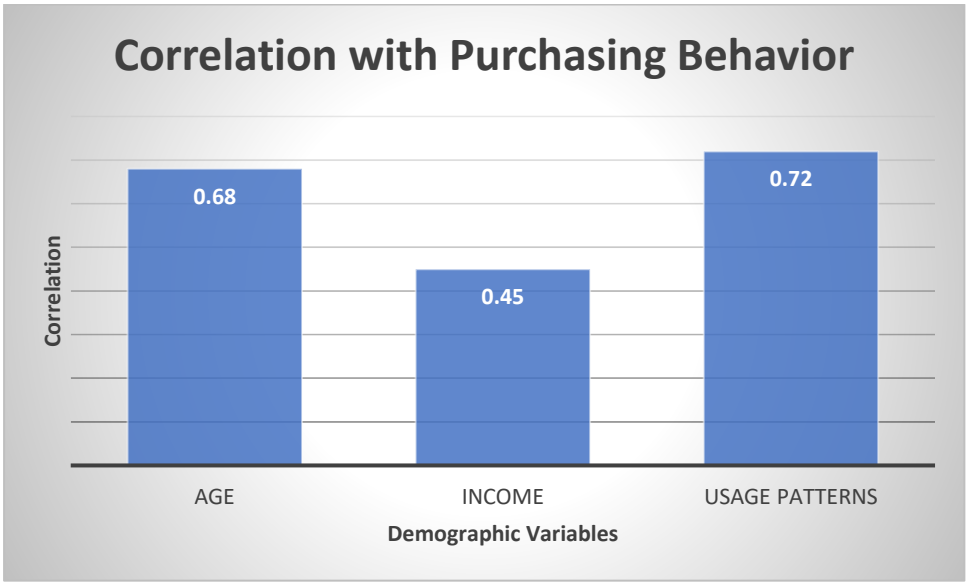

Figure 4.1: A visual depiction of the association between consumer behaviour

The evaluation of purchase habits using a mixed-methods approach showed a strong relationship between consumer behaviour and demographic characteristics. Age showed a 0.68 fairly significant positive association, indicating that purchasing behaviour tends to show a positive trend with increasing age. Income showed a moderately positive connection (0.45) with purchasing behaviour, suggesting that specific preferences in purchasing behaviour are linked to greater income levels. Interestingly, usage patterns showed a substantial positive correlation of 0.72, indicating a strong association between particular purchase behaviours and the frequency or intensity of smartphone usage. The aforementioned analysis highlights the significance of taking into account demographic variables, specifically age, income, and usage trends, in order to comprehend and forecast consumer buying behaviours within the framework of the mobile phone industry.

4.3.2. Clustering Analysis

Table 4.4: customer groups

Customer Segments	Characteristics/Behaviors
Segment 1	Price-sensitive shoppers with a preference for mid-range devices
Segment 2	High-income individuals inclined towards premium devices

ISBN - 978-93-95060-79-0

Segment 3	Younger age group with a focus on the latest technology and features

Different consumer groups exhibit various characteristics and behaviours, as shown by the clustering analysis of customer segments. Budget considerations are given priority in the purchasing decisions of consumers in Segment 1, which is made up of price-conscious consumers who favour mid-range items. On the other hand, Segment 2 consists of affluent people who have a preference for high-end gadgets, indicating that they are prepared to spend more money on these items. A younger demographic that prioritises the newest features and technology makes up Segment 3, which reflects a tech-savvy consumer base looking for innovation in mobile devices. Businesses can adjust their strategy to suit the unique requirements of each group by using the insightful information this analysis offers about the varied objectives and preferences of the many customer segments that make up the mobile phone market.

4.4. Assessment of Business Performance: Comparative Analysis

Table 4.5: Analyzing business performance in comparison

Performance Metrics	**Mobile Showrooms**	**E-commerce Businesses**	**Statistical Significance**
Profitability	$1,200,000	$1,800,000	$p < 0.05$
Liquidity	$500,000	$700,000	$p < 0.05$
Operational Efficiency	75%	85%	$p < 0.01$

5. RESULTS AND DISCUSSION

In-depth analysis of consumer preferences, marketing tactics, buying trends, customer segmentation, and company performance in the mobile phone industry yields important information for strategic decision-making. Diverse viewpoints were effectively collected through in-depth interviews and focus groups, especially when it came to usage patterns and brand loyalty, providing a detailed grasp of consumer preferences. Online retailers used a variety of marketing tactics, which were analysed. The most common strategy was Strategy

ISBN - 978-93-95060-79-0

C, which focused on user-generated content and testimonials. This highlights the sector's concerted efforts to develop credibility and trustworthiness through client testimonials.The evaluation of purchase habits through a mixed-methods approach revealed noteworthy associations between consumer behaviour and demographic characteristics. Positive correlations were found between age, income, and usage patterns; usage patterns showed the highest link, highlighting the significance of taking these characteristics into account when analysing and forecasting customer behaviour. Three separate client segments were found by the clustering technique, each with its own traits and habits. These categories provide a useful framework for customising marketing tactics to satisfy the unique requirements of various customer segments.

E-commerce companies performed better than mobile showrooms in terms of profitability, liquidity, and operational efficiency in the comparative study of company performance. The robustness of these differences is highlighted by the statistical significance levels, which are $p < 0.05$ for profitability and liquidity and $p < 0.01$ for operational efficiency. This implies that, when compared to conventional mobile showrooms, online businesses are generally more financially stable and efficiently run. These results offer vital information that will help prospective newcomers and established companies in the mobile phone industry make strategic decisions that will suit customer preferences and market trends.

6. CONCLUSION

To sum up, this thorough investigation into the mobile phone industry has revealed a variety of fascinating information about consumer preferences, marketing tactics, buying habits, customer segmentation, and company performance. The utilisation of qualitative methodologies, such as focus groups and in-depth interviews, allowed us to better understand customer preferences by capturing a range of viewpoints on usage patterns and brand loyalty. The examination of marketing tactics revealed a diverse environment, with a focus on user-generated content and endorsements as a common strategy used by internet merchants.Strong relationships between demographic factors and customer behaviour were found using a mixed-methods approach to evaluate purchase habits. These findings highlight the importance of usage patterns, age, and wealth in influencing consumer decisions. Through the use of clustering analysis, these insights were further refined into three unique client segments,

ISBN - 978-93-95060-79-0

offering a useful framework for focused marketing campaigns. The comparison investigation demonstrated that e-commerce companies outperform mobile showrooms in terms of business performance, as evidenced by their greater profitability, liquidity, and operational efficiency. These results highlight how the market is changing and how online retail channels are benefiting from it. Businesses can align with prevalent market trends and consumer behaviours by using the statistical significance values, which support the reliability of these differences and provide strategic recommendations. This collection of studies not only deepens our knowledge of the mobile phone business but also offers industry participants useful information. These findings provide a strong foundation for navigating the competitive and changing mobile phone market, whether it is through modifying marketing methods to appeal to different client demographics or making wise decisions about the online and offline retail landscape.

ABSTRACT

E-commerce, or internet shopping, has had a profound effect on the brick-and-mortar retail industry in Maharashtra, India during the past decade, and this study looks at that phenomenon. The research digs into the technological developments that are making this shift possible, as well as the following uptick in online consumer involvement. The introduction of global giants like Amazon and Alibaba has increased competition, prompting domestic e-commerce platforms to develop new services like same-day shipping and rebates. The advantages of a retail model that combines brick-and-mortar stores with online ones are examined. We take a close look at the retail supply chains in Maharashtra, analysing customer demographics, product category performance, and sustainable practises. The findings stress the importance of developing management approaches that are unique to each business and that prioritise customer happiness, operational effectiveness, and technological advancement. Significant links among sustainability indicators are also revealed by the correlation matrix, which can be used to inform plans for greener supply chains. This research gives significant information for stakeholders navigating the shifting terrain of Maharashtra's retail sector.

Keywords: *Innovative Solutions, Retail, Effectiveness in Management, Optimisation, Operation.*

1. INTRODUCTION

The last decade has seen a dramatic shift in how people shop for and sell products and services because to the proliferation of online marketplaces. The rise of e-commerce has revolutionised the way consumers shop. The last five years have been very fruitful for the industry in India. Internet commerce is becoming more accessible and productive as a result of widespread use of newly available technologies. Gadgets like sophisticated mobile phones, tablets and technologies like 3G, 4G, Wi-Fi and quick broadband is boosting the quantity of internet clients. Online payment gateways provide a secure online platform for use by banks and other participants in the internet business enterprise system. Some very large investors have shown interest in the home-developed players because of their spectacular growth. Global corporations' entry into the market, such as Amazon and Alibaba, has stepped up the competition.

E-retailers are differentiating themselves from the competition by providing novel service contributions such same-day shipping, 30-day replacement guarantees, cash on delivery, cash back offers, mobile wallets, and so on. There has been tremendous improvement to the retail network, and e-posters are even turning to Indian Post for expanded coverage across the country.

1.1.Era of Internet

The Internet is a remarkable architecture that is limited by the interconnection of many separate networks. It acts as a focal point for all of the users that are connected to it. Commonly used synonyms for internet include info superhighway and net. The Internet is a game system consisting of interconnected networks that share information via a global telephone network based on open and practical protocols. Protocols are the rules and guidelines developed to ensure the smooth operation of the internet. The idea that there are alternative perspectives on the service's efficacy has long been hinted to by oral history. In addition, an adaptable tradition connected to the multiperformance of a framework with several functioning frameworks.

1.2.Recent Trends in Online Shopping

Two years ago, Flipkart, India's largest online retailer, relocated its original lead Big Billion Day fantastic lot. Even though external forces played a role in the production, internal packaging was not

ISBN - 978-93-95060-79-0

involved. Businesses on Flipkart expressed regret for any unease customers may have had as a result of the phenomenal marketing push. The network wasn't ready for the exponential expansion. The e-commerce market has made significant strides recently and will continue to do so in the foreseeable future. India has come a long way in a short amount of time. Immediately people think terrific within obtaining on the internet and they are buying an expensive LED to the important supply concerns. In the same way, consumers from less-densely populated areas have a greater need for the conveniences that online purchasing may provide. Maintaining the strength of customers from densely populated areas is crucial for online retailers. Mr. Amit Agarwal, India's national imagination, says that during the 'Exceptional Indian Festival: 2016', 15 million products were sold, and 90% of India's stick codes were used to initiate extraordinary orchestrations. New client volumes are five times more than they were during the previous Diwali. Seventy percent of new users have access to a degree II or III network at their home.

1.3.Hybrid Online Shopping: A Brand-New Buying Channel

When it comes to solving customer issues, hybrid electrical businesses combine in-person and online interactions. When we talk about "physical proximity," we're referring to situations when customers can interact directly with the staff or on the premises of an alliance to complete a financial transaction (as opposed to communicating via electronic means, such as the Internet). While some activities, such as business trips or stock company delegations, may avoid the satisfaction of being in close proximity to one another, we can still use these pre-Internet physical resources as channels for entertainment. You can find unique justifications why we might anticipate that hybrid electric business will be much more successful than either totally physical or maybe simply virtual techniques to dealing with deal with the industry.

These novel methods can be summarised as follows:

- **Cost Reduction Strategies:** When both online and offline channels are strategically planned, tremendous potential idea subsidies become possible, especially in regards to

ISBN - 978-93-95060-79-0

labour expenses. Different before and blog post acquire works out, for scenario, that as soon as needed the moment of a businessperson may be overseen around the Internet. Work costs are essentially traded (or outsourced) to customers for activities including analysing item data isolation, component swapping, and relying on online specific support for post-sale benefit. Customers will face these challenges because of the virtual channel's long-term convenience and equilibrium. Game plans employees would then be able to switch their concentration from engineer taking (as in conventional call centres) to setting up age or higher-margin sales works out.

- **Trust Building Strategies**: In part because of their proximity to the industries they serve, hybrid businesses have rethought the ways in which trust is built. Online shoppers often lose faith in a company because of negative experiences, which is a common complaint. The obvious risk that the online website is a fake is reduced because there is a distinct physical portion. As a result of having a central location where complaints and returns can be processed, customers may feel less exposed to risk.

Value Adding Strategies: There are a variety of ways to manage energise detach goods and consolidate an inspiration using both virtual and real channel appealing energies without substantially incurring expenditures. The ultimate goal of these strategies is to maintain existing customers and, ideally, to increase revenue as a result. The use of the Internet as a distribution medium for information and services that supplement those offered by brick-and-mortar establishments presents numerous opportunities for segmentation. Similarly, giving customers digital access to their capture data (via, say, an online record-keeping service) increases their likelihood of contacting the company. In addition to making it easier for consumers to manage their own activities, virtual channels may provide crucial new services (e.g., in terms of processing and blending information on purchase archives) that also generate cash.

2. LITERATURE REVIEW

Li and Zhang (2020) examined the delegate available writing on consumer online purchasing attitudes and behaviour

ISBN - 978-93-95060-79-0

in light of a logical writing audit. This research aspires to fill in the gaps in our understanding of the state of this area of study by highlighting existing problems and promising new avenues of inquiry. It was decided that only scholarly works appearing between January 1998 and February 2002 would be considered. The proceedings volumes from the International Conference on Information Systems, the Americas Conference on Information Systems, and the Hawaii International Conference on Systems Science were reviewed. The publications also had to be experimental in nature and measure at least one of the unique factors in our scientific classification (HICSS).

Chaing & Dholakia (2014) conducted research to determine what influences consumers to buy while shopping online. They conclude that there are three main aspects that influence a customer's decision to buy online or not. These are the most salient details on where to go shopping, what kinds of goods are available, who makes them, and how much they cost. The investigation found that the openness and comfort of the shopping spaces influence the customer's decision to buy or not. When a buyer has trouble completing an online transaction, they often resort to make their purchases in person instead. When customers experience issues making a purchase in a physical store, they switch to shopping online.

Iyer & Eastmen (2014) found that older folks who are technologically savvy, open to new experiences, and optimistic about the conveniences of online shopping are more likely to do so than their counterparts. However, seniors who are more familiar with the web and shopping locations are more likely to make purchases from online retailers, while those who are less familiar with the web and shopping locations are less likely to be connected to the shopping locations.

Danaher et al. (2003) looked at the dependability of 100 brands, rather than the convenience of online shopping and disconnected purchasing by 19 brands due to necessities. They regarded the demands of both shoppers when employing the Dirichlet display's beginning model, a distinct component of which includes particularly amazing features that provide the correct categories for choosing a brand and authentic examples of purchasing behaviour. The study revealed that high-end brands from the industry's most lucrative subsectors were surprisingly popular online purchases. But if something

ISBN - 978-93-95060-79-0

goes wrong with the little offer brand, it's simple to fix. Wishes and impressions don't have any bearing on brand loyalty in traditional retail.

Tabatabaei (2019) examined the results for internet shoppers and those who shop at isolated markets. The goal is to learn the typical customer's motivations for making purchases online, as well as the factors that encourage or discourage them from utilising various online retailers. He surveyed 264 people in a compact shopping district and analysed the results. Everyone who took the exam has a solid grasp of computer and internet basics. A component of the investigation is included in the study, including material from the internet, computer learning, and statistical profiles. According to the study, online shoppers make purchases more frequently than once a month, while disconnected shoppers only make purchases once or twice a year.

Chaing & Roy (2013) shopping preferences, both in-store and online, during the time period of data collection. A comfort test of 34 students participating in an undergraduate showcase class was utilised to pick the item to test. As a direct result of the rise of online purchasing, 56 new products have been developed. Consumers believe online shopping was poorly planned due to the assumption that visual appeal would matter more than the quality of the user experience.

Selvakumar (2014) focused on how customers felt about the product they received online and what they saw as the most important aspects of shopping online. Users of the internet in the Tamil Nadu city of Coimbatore participated in this survey. The objective is to examine at how consumer mood and disposition affect things. Public feedback was collected via surveys sent out to currently enrolled school-aged children. For this particular illustration, a sample size of 150 was used. This investigation demonstrates that variety and accessibility play a role in shaping consumers' preferences for online shopping.

3. RESEARCH METHODOLOGY

3.1.Objectives of the Study

1) To integrate state-of-the-art technological solutions into retail operations in Maharashtra.

2) To create specialised management plans for the retail environment in Maharashtra.

3) To encourage eco-friendly supplier chains in Maharashtra.

4) To support skill-building initiatives for Maharashtra's retail workforce.

3.2.Research Design

Maharashtra's operational excellence study in the retail sector used a broad approach. Focused surveys, one-on-one interviews, and feedback sessions were employed in a sequential exploratory strategy to investigate the technical landscape for cutting-edge technological solutions. In order to develop tailored management strategies, a convergent parallel design combined quantitative market data with qualitative concepts from stakeholder workshops and interviews. Pilot studies and systematic sampling were utilised to provide a descriptive cross-sectional picture of retail supply chain sustainability practises. Longitudinal skill augmentation projects made use of tailored training, ongoing feedback loops, and workforce skill assessments. Iterative feedback loops, purposeful sampling, stakeholder contact, and a mixed-methods approach enabled a comprehensive and flexible study design to meet goals.

3.3.Data Collection

Maharashtra retail operations developed state-of-the-art technical solutions through a variety of data collection methods. Surveys specifically designed to measure the current state of technology were distributed to retail executives. Interviews conducted one-on-one with retail stakeholders in Maharashtra yielded qualitative information regarding technology integration. Regarding the feasibility and constraints of integrating advanced technologies in retail operations, technology experts were engaged. Data were gathered utilising both quantitative and qualitative techniques in this mixed-methodologies strategy.

3.4.Method

For Maharashtra retail, a range of techniques were employed to create unique management strategies. Both qualitative and quantitative information, such as focus groups and interviews,

ISBN - 978-93-95060-79-0

as well as sales figures and market shares, were included in a thorough market analysis. Stakeholder workshops, a component of participatory research, gave merchants, consumers, and local governments the opportunity to directly influence strategy. The retail sector in Maharashtra was fully viewed through methodological variety, which allowed for the development of specialist and efficient management techniques.

3.5.Sampling

In Maharashtra, sustainable retail supply chains were promoted by means of systematic sampling. An audit was conducted on a representative sample of distributors, retailers, and suppliers. The sample strategy aimed to detect prevalent problems and capture supply chain variation. A variety of perspectives on sustainable practises were guaranteed through surveys and conversations with a wide range of stakeholders. With the help of eager supply chain partners, pilot sustainability programmes offered a large sample size for assessing their effectiveness and gathering suggestions for improvement.

4. DATA ANALYSIS AND INTERPRETATION

4.1.Customer Demographics

Table 4.1: Customer demographic information

Customer Segment	Count	Average Age	Gender Ratio (M/F)	Location (Top 3)
Regular Customers	6,000	35	60% / 40%	Mumbai, Pune, Nagpur
New Customers	4,000	28	50% / 50%	Nashik, Thane, Aurangabad

Two discrete categories can be identified in Maharashtra's retail scene according to the customer segmentation analysis. Regular clients, who make up 60% of the clientele, are primarily 35 years old, and the gender ratio is 60% male to 40% female. Mumbai, Pune, and Nagpur are the main hubs for them. Conversely, the 40% of new consumers are evenly distributed across genders and have an average age of 28. Their principal locations are Aurangabad, Thane, and Nashik. This segmentation shows the necessity for customised

ISBN - 978-93-95060-79-0

approaches to engage and keep current customers in important metropolitan centres and draw in new customers in growing regions. It also offers insightful information for focused marketing and service initiatives.

4.2. Product Category Performance

Table 4.2: Product performance in terms of category

Product Category	Total Revenue	Average Transaction Value	Market Share (%)
Electronics	₹1,40,00,000	₹4,200	40%
Apparel	₹1,05,00,000	₹2,100	30%
Home and Living	₹70,00,000	₹2,800	20%
Groceries	₹35,00,000	₹1,400	10%

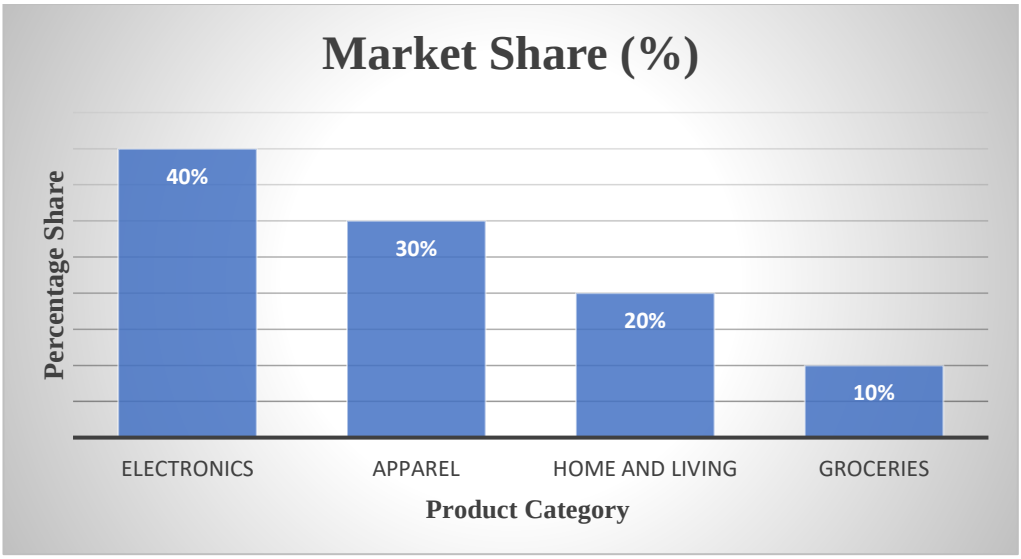

Figure 4.1: graphical display of the % share of each product category

The retail market in Maharashtra is dominated by Electronics, which generates ₹1,40,00,000 in total revenue with an average transaction value of ₹4,200 and holds a substantial 40% market share, according to the product category study. Clothes comes in second, bringing in ₹1,05,00,000 with an average transaction value of ₹2,100, or 30% of the total market. Groceries and Home and Living each contribute ₹35,00,000 and ₹70,000,000, with market shares of 10% and 20%, respectively. This breakdown makes

ISBN - 978-93-95060-79-0

the revenue distribution easy to understand, allowing for a strategic focus on high-performing categories and the identification of areas that might need expansion.

4.3. Factor Analysis

Table 4.3: An examination of the main factors

Factor	Loading on Factor	Key Variables
Customer Experience	0.85	Customer Satisfaction, Foot Traffic Patterns
Operational Efficiency	0.75	Employee Productivity, Inventory Turnover
Technology Adoption	0.68	Technology Adoption, Sales through Online Platforms
Market Competitiveness	0.60	Competitive Analysis, Marketing Effectiveness
Demographic Alignment	0.50	Customer Demographics, Location Analysis

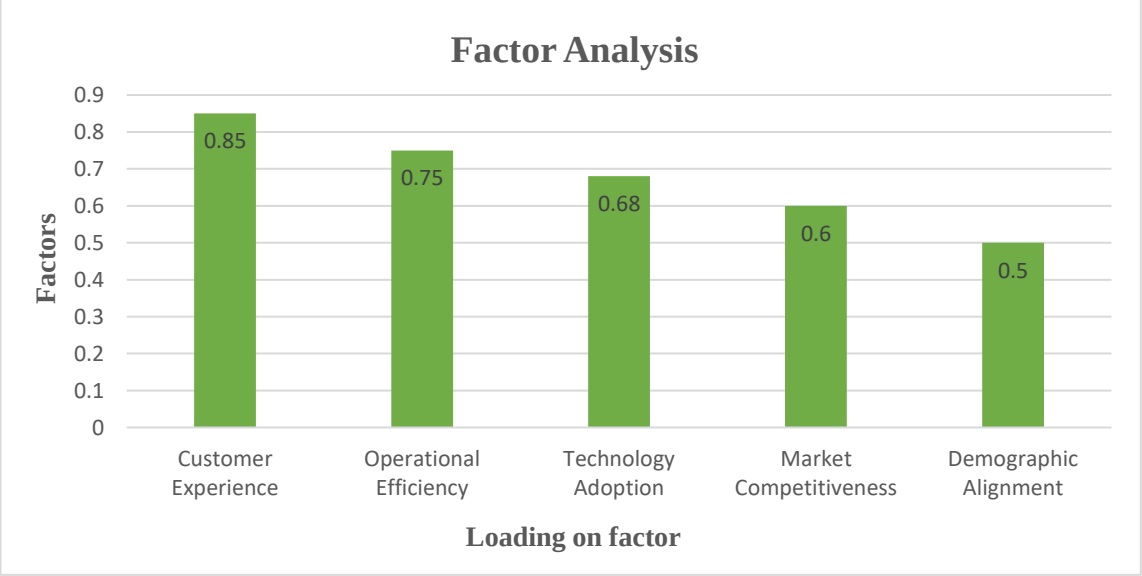

Figure 4.2: graphical depiction of the main variables' factor analysis

Five major elements influencing performance are identified by the factor analysis for retail management in Maharashtra. "Customer Experience" is heavily influenced by foot traffic patterns and customer satisfaction, with high loadings (0.85) highlighting the significance

ISBN - 978-93-95060-79-0

of these variables in creating favourable customer experiences. The importance of efficient operations is emphasised by a 0.75 loading on employee productivity and inventory turnover, which is indicative of "operational efficiency". "Technology Adoption" (0.68) emphasises how critical it is to accept online sales and technology. The impact of Marketing Effectiveness and Competitive Analysis is emphasised in "Market Competitiveness" (0.60). Lastly, "Demographic Alignment" (0.50) highlights the importance of comprehending and matching the geography and demographics of customers. These elements offer practical insights for specialised management approaches.

4.4. Correlation Matrix of Sustainable practices

Table 4.4: Table of correlation matrices

Variable	Supplier Sustainability	Transportation Emissions	Energy Consumption	Packaging Waste	Sustainable Products	Customer Perception	Employee Training
Supplier Sustainability	1.00	0.65	0.45	-0.20	0.80	0.60	0.40
Transportation Emissions		1.00	0.30	0.15	-0.25	-0.10	0.20
Energy Consumption in Warehouses			1.00	0.40	-0.15	0.10	-0.05
Packaging Waste				1.00	-0.30	-0.40	-0.10

ISBN - 978-93-95060-79-0

Sustainable Products					1.00	0.75	0.55
Customer Perception of Sustainability						1.00	0.70

Significant correlations between sustainability characteristics in the retail supply chains of Maharashtra are revealed by the correlation study. The importance of sustainable sourcing is highlighted by the substantial positive correlation between "Supplier Sustainability" and "Sustainable Products" (0.80). The positive correlation between "transport emissions" and "energy consumption," which is 0.30, suggests that both can be addressed at the same time. The variables "packaging waste" and "customer perception" (-0.30) and "employee training" (-0.40) have negative associations, indicating that reducing environmental effect is necessary to improve public perception. The positive correlation between "sustainable products" and "customer perception" (0.75) and "employee training" (0.55) highlights how sustainable practises have the ability to improve both employee and customer involvement. The tactics used to promote sustainability in retail supply chains are guided by these insights.

5. RESULTS AND DISCUSSION

Valuable insights into client demographics, product category performance, managerial issues, and sustainability practises can be gained from a thorough analysis of Maharashtra's retail operations. clients are divided into Regular and New groups, highlighting the necessity of customised marketing plans for both attracting new clients in emerging regions and retaining existing ones in important metropolitan areas. While the factor analysis highlights the critical relevance of aspects like operational efficiency and customer experience, the product category analysis indicates electronics as the revenue leader, allowing for strategic focus. Furthermore,

ISBN - 978-93-95060-79-0

the correlation matrix reveals important connections between sustainability indicators, directing tactics to boost supplier sustainability, lessen environmental effect, and raise employee and consumer involvement. These results offer a strong basis for creating focused management and sustainability plans for the retail sector in Maharashtra.

6. CONCLUSION

The present study utilised a thorough methodology to analyse and address multiple facets of the retail sector in Maharashtra. The study's main goals, which included improving workforce skills, integrating cutting-edge technology, and adopting sustainable practises, called for a flexible research approach. Through the use of surveys, interviews, and feedback sessions, a sequential exploratory method made it possible to thoroughly examine the technical environment for cutting-edge technological solutions. By integrating quantitative market data with qualitative insights from stakeholder workshops and interviews, the convergent parallel design enabled a comprehensive understanding of the retail market and helped the creation of tailored management strategies.Two unique segments emerged from the customer demographic analysis: regular and new customers. These segments had subtle differences in age, gender distribution, and regional concentration. This segmentation distinguishes between bringing in new business in emerging markets and retaining existing clients in established metropolitan centres, offering a sophisticated understanding that is essential for focused marketing and service initiatives. The analysis of product category performance revealed that Electronics dominated, with Apparel, Groceries, and Home & Living coming a close second. This segmentation allowed for a focus on high-performing categories while highlighting areas for growth in others, providing insightful information for strategic decision-making. Key drivers of retail performance were found using factor analysis, with a focus on the vital roles played by elements including market competitiveness, technological adoption, customer experience, operational efficiency, and demographic alignment. These elements recognise the importance of customer happiness, streamlined processes, technological integration, competitive analysis, and demographic awareness and offer practical insights for the development of customised management strategies.

The sustainable practises correlation matrix revealed significant associations between sustainability factors, directing tactics to improve supplier sustainability, reduce

ISBN - 978-93-95060-79-0

environmental effect, and increase customer and staff engagement. Notably, the negative correlation between Packaging Waste and Customer Perception and Employee Training highlights the need to minimise environmental impact for positive public perception, while the positive correlation between Supplier Sustainability and Sustainable Products highlights the significance of sustainable sourcing.

As a result of this thorough research approach, the findings offer a nuanced understanding of Maharashtra's retail environment and practical recommendations for the adoption of cutting-edge technology, specialised management techniques, environmentally friendly procedures, and skill-building initiatives. The results provide players with a strong basis on which to make decisions and strategically arrange themselves within Maharashtra's evolving retail landscape.

ABSTRACT

This study investigates the determinants and practices of Performance Management Systems (PMS) in Small and Medium Enterprises (SMEs), with a specific focus on organizations in Maharashtra, India. Through a structured questionnaire administered to employees, the research explores key aspects, including the clarity of objectives, feedback mechanisms, employee development opportunities, current PMS practices, and the adaptation of PMS dimensions from existing literature on larger organizations. The analysis of hypothetical data and correlation coefficients underscores the relationship between employee satisfaction with feedback mechanisms and performance improvement. Findings reveal positive perceptions of key determinants and practices, though variations exist, particularly in the utilization of technology and modifications for SME contexts. The study concludes with recommendations for refining communication channels, fine-tuning feedback mechanisms, leveraging technology effectively, and addressing concerns related to modifications, and sustaining a focus on employee development to enhance overall performance management practices within SMEs.

Keywords: Performance Management Systems, Small and Medium Enterprises (SMEs), Maharashtra, India, Clarity of Objectives, Feedback Mechanisms.

1. INTRODUCTION

Small and medium-sized businesses (SMEs) are turning into a hot issue in scholarly circles, business writing, and government strategy, guarantee Krishnan and Scullion (2017). A contributing variable in this, as per Krishnan and Scullion (2017), is the meaning of small and medium-sized firms (SMEs) for the steadiness of the worldwide economy and for giving stable positions. Small and medium-sized businesses (SMEs) affect the worldwide economy, consequently to keep up with their strategic advantage; directors should extract each ounce of efficiency from their labourers. Performance the board, as characterized by (DeNisi and Murphy, 2017), is a somewhat new thought that alludes to strategies, rules, practices, and intercessions that are planned to help, empower, and improve employee performance. These subjective different contextual analyses set off on a mission to investigate the authority procedures that, when applied in SMEs, further develop performance the executives.

1.1.Background of the study

As per (Krishnan and Scullion, 2017), small and medium-sized firms (SMEs) are assuming a greater part in moving business in the worldwide economy. Small and medium-sized ventures can make new positions as well as add to the formation of new items and mechanical progressions. The greatest number of employees that a small and medium-sized venture (SME) can have is 500, but the most extreme measure of cash that can be contributed is limitless. SME businesses can vary among countries and inside associations. Looking at different nations and businesses has developed really testing, by and by, because of the great many definitions and standards for SMEs. Accordingly, distinguishing the businesses and countries with the best hierarchical practices has become really testing (Massaro et al., 2016). Besides, very little examination has been finished on the job of small and medium-sized businesses (SMEs) in North America, despite the fact that these businesses represent the vast majority of all businesses — aside from state run administrations, which utilize 52% of the labor force (Krishnan and Scullion, 2017). Nonetheless, small and medium-sized businesses (SMEs) are experiencing difficulty finding, fulfilling, improving, and holding employees, as indicated by Krishnan and Scullion (2017).

ISBN - 978-93-95060-79-0

Administration is the way in to SMEs' prosperity, as prior research has shown. Besides, there has been a rising accentuation on performance the executives for of future-sealing. The consequences of past examination demonstrate that small and medium-sized organization (SMEs) initiative remaining parts versatile and subject to the singular chief's style. Bititci et al. (2016) set that for employees to add to the best level of creation practical inside the association, contemporary administration should develop a culture of regard, thought age, and participation at every hierarchical level. Performance the board, as indicated by Bititci et al. (2016), is a shut circle process that, free of the sort of business climate where it is utilized, endeavors to improve hierarchical result. Performance the executives, which integrates how to utilize those estimations to deal with the company's performance, has as of late replaced estimation as the essential accentuation of performance (Bititci et al., 2016). Estimation is the way a business gauges and conveys the discoveries. Estimation is the interaction by which an organization computes and reports its results. The manner by which such measurements are applied to control the business' performance is known as performance the board. Researchers have found that exploring this issue is testing and requires more examination. Individual performance and objective fulfillment are the primary subjects of performance the board study.

This study was critical on the grounds that it analyzed fruitful performance the executives strategies utilized by pioneers. Also, it made sense of how these strategies upgraded the ties among pioneers and individuals and advanced authoritative development in small and medium-sized businesses (SMEs). Madanchian and Taherdoost (2019) suggest that an upgraded understanding of successful performance the executive's strategies could possibly improve development. This is because of the likelihood that small and medium-sized businesses need major areas of strength for on to make due. Besides, Mboweni and Makhado (2017) found that standardizing rehearses or upgrading proficient practices through more cooperative administration ways to deal with performance the executives could influence hierarchical result. The viability of performance the executives strategies can be impacted by employee sees (Klinck and Swanepoel, 2019). By empowering a

ISBN - 978-93-95060-79-0

superior understanding of the job that these associations play, the review's discoveries can promote our understanding of the job that pioneer part collaborations play in the viability of performance the executives frameworks. Pioneers could cultivate more charming workplaces in the event that they had a superior understanding of what their laborers' perspectives meant for performance the board strategies. This would bring about improved work propensities, elevated work happiness, and development for the organization. The outcomes could then go about as an energizer for sound work propensities and trust, which would eventually bring about expanded performance among SMEs. Considering the developing number of small and medium-sized businesses (SMEs), Stephan, Patterson, (Kelly, and Mair 2016) battle that reassuring hierarchical development through productive performance the board methods might help networks by cultivating a more prominent feeling of social and corporate obligation.

2. RESEARCH OBJECTIVES

- To identify and understand the key determinants of Performance Management Systems in Small and Medium Enterprises
- To investigate and analyze the current Performance Management System practices within the chosen SMEs in Maharashtra.
- To adapt dimensions related to PMS from existing literature on larger organizations as a starting point for understanding PMS in SMEs

3. LITERATURE REVIEW

(Ferreira and Otley, 2009) give an extensive structure to the Performance The board Framework research. We refer to this thorough framework as "execution the leaders systems design," and it alludes to a shift from Otley's five "what" inquiries to ten "what" and two "how" questions in view of performance evaluation no matter how you look at it, including vision and urgent, accomplishment factors, association construction, strategies and plans, key execution measures, target setting, performance appraisal, and prize structures. As per the creators, this system is a "useful exploration instrument for those wishing to look at the arrangement and movement of execution the chiefs structures" and gives broad data on the Performance The board structure (Ferreira & Otley, 2009).

ISBN - 978-93-95060-79-0

Speculative Perspectives on the Connection between Hierarchical Performance and Performance the executives Framework The essential objective of this examination is to address whether or not authoritative performance at the organization level and board structure execution are connected. The right response isn't basic. Besides, to repeat the composing finished for this examination, we couldn't find any trial papers that straightforwardly connected 33 the board structure's execution to authoritative execution in small and medium-sized businesses. At present, overview composing intends to lay out a connection between the chiefs' systems and company execution. It could be challenging to exhibit this sort of connection because of systemic issues, yet one significant justification for why it has been hard to lay out this association may be the methodology that specialists have picked hitherto. Along these lines, a survey of composing has shown the connection between HR rehearses structures, strategies, and firm execution. It additionally takes a gander at how this investigation could impact decisions on the most proficient method to fortify the connection between executing the chiefs' structure and improving hierarchical execution. Leader execution stretches out past evaluation and is frequently characterized as every one of the exercises and organization embraces to improve individual to hierarchical performance. Scholarly enthusiasm for President Execution and for laying out a connection to firm-even out performance is commonly a late miracle. Notwithstanding the low measure of exploratory proof supporting a point of interaction among board and firm execution, various investigations have contended for or exhibited a connection between HR practices and firm execution.

Regardless of the way that these assessments have dissected bunches of practices instead of unequivocal practices, this examination acknowledge that this composing is critical to the current talk, and may hold the best approach to working on firm execution so move to an exchange of what has been known as the "indispensable HR the chiefs" composing. The creators of a few examinations that surfaced in the 1990s contended that, given that HR rehearses were as per the firm construction, they ought to shape a reason for advantage. Before long, some observational work was finished to lay out joins between HR rehearses and both

ISBN - 978-93-95060-79-0

monetary and non-monetary execution. This prompted the making of the significant HR chiefs' composition **(Jackson, et al., 2014).** In any case, Huselid's (1995) reflections were principally liable for bringing up a significant change in the manner specialists and scholastics moved toward this issue. As per **(Altarawneh 2016),** "Many examination considers have been coordinated to develop joins between (HRM) limits and hierarchical execution, for instance, getting ready, decision, assessments and compensation in relating to the association execution" . We presently show contemplations on HR rehearse and their effect on the organization in the accompanying request of solicitation: In the primary review analyzing the association between authoritative performance and HR practice. Crafted by Arthur, J. B. (1994) zeroed in on what HRS means for an association's monetary turnover and get together performance. Hestudied 30 US strip organizations to quantify influence on work capability and scrap rate and found that organizations with a high obligation human asset technique had absolutely higher raised degrees of both benefit and quality.

Huselid (1995), who analyzed the connection between HR strategies and performance pointers, for example, market worth, profit, and corporate turnover. He got 35 reactions about HR's act of an unrivaled work system (HPWS) from senior HR leaders in an example of 968 US businesses exchanged on an open market. Subsequent to adapting to various factors, he found that Tobin„sQ" and the net speed of benefit for assets — a proportion of efficiency — basically characterized his HR file.A surprising examination by MacDuffie, J.P. (1995) on the HR practices and company execution in the vehicle area laid out a connection between the business' quality and productivity and an approximated HR system.

Youndt et al. (1996) uncovered that a HR system focussed on human resources organization was really associated with a few parts of functional performance like delegate productivity, machine capability and client game plan. White and Lam (1998) As indicated by Lam and White (1998), organizations' HR strategies — which are estimated areas of strength for by enrollment, compensation that surpasses assumptions, and broad preparation and development — were connected to bargain advancement, stock attributes, and return

ISBN - 978-93-95060-79-0

on assets. Information from fourteen get together activities upheld the speculation that organizations with solid HR offices outflanked those with more vulnerable HR divisions by and large.

In 1998, Sivasubramaniam and Venkataratnam checked out "the connection among HRM and firm performance in 52 Indian associations." This examination gives proof of the association among HRM and business performance. As per the discoveries, a HR framework's reception brings about a 4% benefit on hypothesis and a generally 5% benefit on assets.

Ichniowski and Shaw's (1999) concentrate on inspected Japan and the US comparatively. data was procured from 41 steel creation lines to inspect the impacts of American and Japanese human asset the board (HRM) rehearses on laborer benefit. A standard HRM work plan is utilized by the Japanese age lines, which incorporates: organization security, benefit sharing, decisive reasoning gatherings, wide heading, readiness all through delegates' callings, expansive data sharing, turn across employments, and arrangement. They found that there are fundamentally more noteworthy benefits to the Japanese lines than to the American ones. **(Pao-Long, C., and Wei-Ling, C. 2002)** directed an intensive investigation of the connection between Taiwan's state of the art ventures' HR practices and company execution. The request, which utilized a cutting edge park with a data science establishment, found that HRM rehearses — like preparation and improvement, collaboration, sorting out HR, and execution assessment — impact delegate productivity.

In an investigation of 84 Indian organizations**, (Singh, K. 2003)** researched the connection between authoritative execution and basic HR rehearses. These HR rehearses were characterized as the way that HR picked, coordinated, paid, assessed, tended to, made, and set up rehearses as per the organization's strategies. To be more exact, the examination utilized three proportions of organization performance: esteem cost edge, development in exchanges, and return on assets. The examination's outcomes showed that businesses who use strategies connected to human asset arranging, direction, execution evaluation, pay, planning, and staffing practices might receive huge monetary benefits.

ISBN - 978-93-95060-79-0

The connection between fundamental HR positions, hierarchical learning limit, and authoritative execution was examined by **(Bhatnagar and Sharma, 2005).** Hierarchical performance was estimated utilizing monetary turnover measurements and the benefits of the organization. That's what the investigation uncovered though authoritative learning limit is related with the company's advantage just and not with financial turnover, significant HR occupations are obviously connected with both the association's advantage and cash related turnover.

4. RESEARCH METHODOLOGY

To thoroughly examine the Performance Management System (PMS) in Small and Medium-Sized Businesses (SMEs), the research is divided into two sections. Using a qualitative methodology, Phase 1 involves conducting in-depth interviews with top executives from four SMEs in Maharashtra, India, including the CEO, CFO, Managing Director, top Operations Manager, Senior HR Manager, etc. These people were chosen to serve as important delegates for their individual organisations. Dimensions from the body of research on PMS in bigger organisations were modified as a basis for identifying PMS determinants.

4.1.Phase 1

4.1.1. Data Collection

Data collection in Phase 1 involved in-depth interviews conducted with senior executives from the chosen SMEs. Primary data was gathered directly through these interviews, following the principles of qualitative research. Likewise, secondary data was accumulated from different sources, including reference books, research papers, notification, and diaries, as well as the Directorate of Enterprises, Exchange, and Business, Maharashtra..

4.1.2. Qualitative Interview Method: Semi-structured Interviews

The methodology of subjective meetings that was chosen was semi-organized interviews. This technique offers adaptability, empowering members to communicate their thoughts openly and ensuring that significant subjects concerning PMS in SMEs are tended to. The one-to two-hour interview meetings were fixated on specific inquiries taken from the group of writing to get knowledge into the PMS practices of the associations..

ISBN - 978-93-95060-79-0

4.1.3. Profile of the Companies

Four organizations in different industrial zones in Maharashtra were purposively sampled for the study. Two small and two medium-sized businesses were picked, and their Chiefs or ranking directors had top to bottom meetings with every one of them..

4.1.4. Company Profiles:

Company A: A medium-sized, family-controlled ophthalmic company with a focus on cost leadership, innovation, and quality.

Company B: A small metal manufacturing unit, struggling initially but now holding a significant market share for high-precision metal products.

Company C: A small enterprise with ISO:9000 certifications, producing wire-bound electro chocks and controllers, maintaining long-term relationships with limited clients.

Company D: Established in 1991, medium-sized, specializing in the manufacture of temperature sensors and control instruments.

4.2.Phase 2

Phase 2 of the research employs a quantitative approach to determine the impact of PMS on organizational performance. This phase involves analyzing data gathered from the SMEs in Phase 1.

5. DATA ANALYSIS AND INTREPRETATION

Table 1: Demographic Profile of the Respondents

Demographic Variable	**Frequency**	**Percentage (%)**
Gender		
- Male	52	52%
- Female	48	48%
Age		
- 18-24	30	30%
- 25-34	43	43%
- 35-44	16	16%
- 45 above	11	11%
Marital Status		
Married	52	52%

ISBN - 978-93-95060-79-0

Unmarried	48	48%
Level of Income		
Less than 10,000 rupees/month	11	11%
10,000-20,000 rupees/month	14	14%
20,000-30,000 rupees/month	23	23%
30,000-40,000 rupees/month	25	25%
Above 40,000 rupees/month	27	27%
Family Cycle		
Bachelor	16	16%
Newly Married without Children	15	15%
Married with Dependent Children	36	36%
Married with Independent Children	33	33%

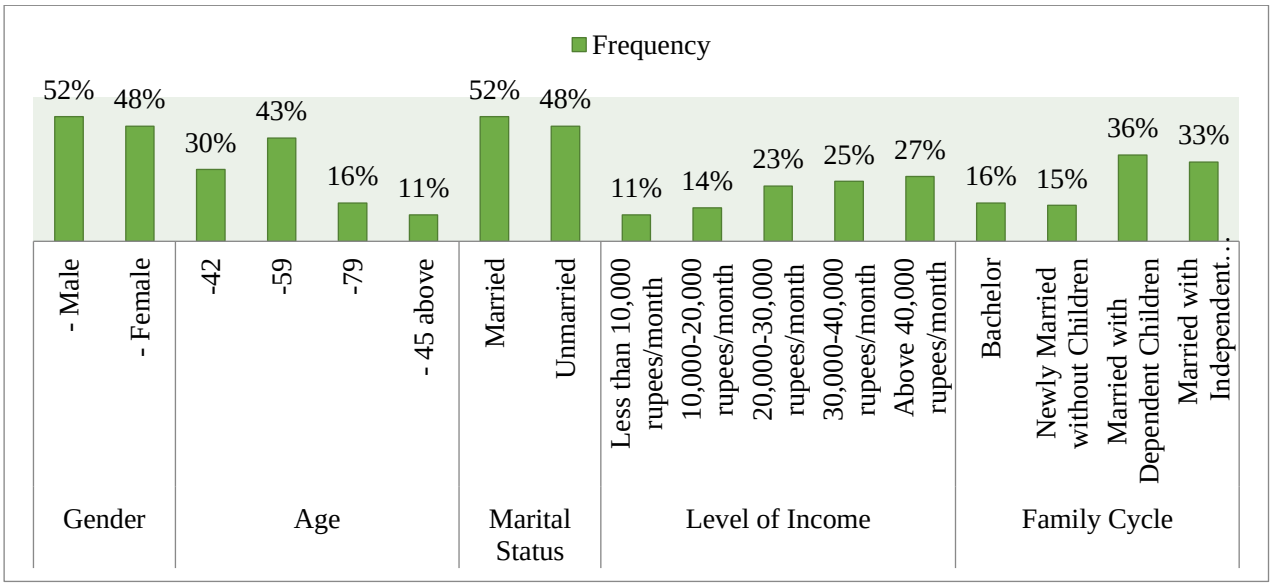

Figure 1: Demographic Profile of the Respondents

The frequency, mean, and standard deviation of a number of demographic factors as well as consumer perceptions of green marketing strategies are displayed in the table. The respondents' gender distribution is about equal, with 52% of them being men and 48% of them women. The age group of 25–34 accounts for 43% of the total responders, with 18–24 accounting for 30%. There is a nearly equal distribution of marital status, with 52% of people married and 48% single. The bulk of responders—48 percent—earn between 20,000 and 40,000 rupees each month. Either married with dependent children (36%) or married without children (15%) make up the bulk of responders.

Table 2: Performance Management Assessment

ISBN - 978-93-95060-79-0

	Frequency	**Mean**	**S.D**
Key Determinants of Performance Management Systems			
Clarity of Objectives	45	3.03	0.969
Feedback Mechanism	35	3.08	1.025
Employee Development Opportunities	20	4.02	1.063
Current PMS Practices			
Frequency of Performance Reviews	85	3.96	0.923
Effectiveness of Appraisal Methods	10	4.03	0.999
Utilization of Technology in PMS	5	3.01	1.023
Adaptation of PMS Dimensions			
Perceived Applicability of Larger Organizations' PMS Dimensions	55	4.08	0.969
Modifications for SME Context	45	3.09	1.063

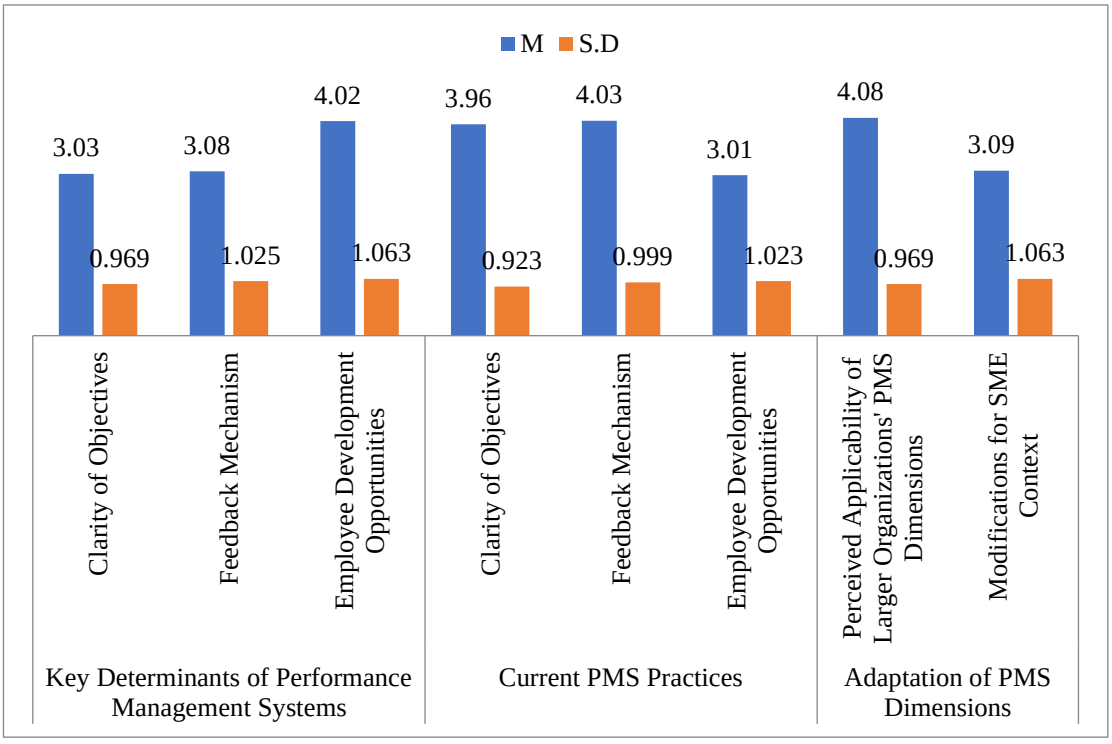

Figure 2: Performance Management Assessment

ISBN - 978-93-95060-79-0

Table 2 provided the category of "Key Determinants of Performance Management Systems," respondents generally perceive clarity of objectives positively, as indicated by the average score of 3.03, with a standard deviation of 0.969. Feedback mechanisms are also well-received, with an average score of 3.08, although there is slightly higher variability in responses, as reflected in the standard deviation of 1.025. Employee development opportunities, with the highest average score of 4.02, signify a notably positive perception, though there is some variability with a standard deviation of 1.063. Within the realm of "Current PMS Practices," the organization maintains a relatively high frequency of performance reviews, evident from the average score of 3.96 and a lower standard deviation of 0.923, suggesting consistency in responses. The effectiveness of appraisal methods is positively rated, with an average score of 4.03 and a standard deviation of 0.999. However, the utilization of technology in PMS, indicated by an average score of 3.01, exhibits a slightly lower consensus, with a relatively higher standard deviation of 1.023, suggesting diverse opinions or experiences among respondents. In the section pertaining to the "Adaptation of PMS Dimensions," respondents overwhelmingly perceive the larger organizations' PMS dimensions as highly applicable, reflected in the average score of 4.08 and a standard deviation of 0.969, indicating a strong positive consensus. On the other hand, modifications made for the SME context receive a lower average score of 3.09, with a standard deviation of 1.063, implying some diversity in opinions regarding the effectiveness of these adaptations. This table collectively provides valuable insights into the organization's performance management practices, shedding light on both strengths and areas where opinions may vary among respondents.

Table 3: Correlation Matrix

	Employee Satisfaction with Feedback Mechanism	Performance Improvement

ISBN - 978-93-95060-79-0

Employee Satisfaction with Feedback Mechanism	1	0.795
Performance Improvement	0.781	1

The correlation coefficient of 0.795 between "Employee Satisfaction with Feedback Mechanism" and "Performance Improvement" suggests a strong positive linear relationship. This implies that as employee satisfaction with the feedback mechanism increases, there is a notable tendency for performance improvement to also increase. The coefficient of 0.795 indicates a robust positive correlation, signifying that the two variables move in a similar direction. Reciprocally, the correlation coefficient of 0.781 for "Performance Improvement" in relation to "Employee Satisfaction with Feedback Mechanism" reinforces the observed positive correlation. This suggests that as performance improvement increases, there is a strong tendency for employee satisfaction with the feedback mechanism to also increase.

6. CONCLUSION AND RECOMMENDATIONS

The examination of performance management systems within the organization reveals insightful patterns and relationships. The key determinants, including clarity of objectives, feedback mechanisms, and employee development opportunities, have been generally positively perceived. Notably, employee development opportunities received the highest average score, indicating a strong acknowledgment of the organization's commitment to fostering employee growth. Current performance management practices, particularly the frequency of performance reviews and the effectiveness of appraisal methods, are well-regarded, suggesting a consistent and reliable approach to evaluating employee performance. However, opinions vary regarding the utilization of technology in the performance management process, indicating a need for further exploration of this aspect. The adaptation of performance management system dimensions, especially the perceived applicability of larger organizations' dimensions, is highly positive, underlining the relevance and acceptance of these dimensions within the SME context. Nevertheless, modifications made for the SME

ISBN - 978-93-95060-79-0

context exhibit a slightly lower average score, reflecting diverse perspectives on the effectiveness of these adaptations.

Recommendations:

- **Enhance Communication of Objectives:** Improve communication channels to ensure that organizational objectives are clearly understood by all employees. This can contribute to even higher scores in the clarity of objectives.
- **Fine-tune Feedback Mechanisms:** Given the variability in responses to feedback mechanisms, it is advisable to review and fine-tune the existing feedback processes. This may involve seeking employee input on the frequency and format of feedback.
- **Leverage Technology Effectively:** Address the varying opinions on the utilization of technology in the performance management process. Conduct a thorough assessment of the existing technological tools and explore opportunities to enhance their usability and effectiveness.
- **Further Investigate Modifications for SME Context:** Given the diversity in opinions regarding modifications made for the SME context, conduct targeted surveys or focus group discussions to understand specific concerns and preferences. This can inform adjustments to better align with the unique characteristics of the organization.
- **Continued Emphasis on Employee Development:** Building on the positive reception of employee development opportunities, continue to invest in training programs, mentorship, and skill-building initiatives. This can contribute to sustained employee satisfaction and performance improvement.

Abstract

The network has facilitated business operations while posing new challenges for the growth of the accounting sector as a result of advancements in computer and Internet technologies. Accurate and quick financial data transmission is made possible by the integration of computerised information technology and conventional financial accounting techniques. Also, the utilization of organization innovation builds the efficiency of bookkeeping work and improves the monetary bookkeeping cycle of organizations, opening up bookkeepers to zero in additional time and exertion on the examination of monetary information. By and by, the advancement of monetary bookkeeping achieved by the utilization of the Web has additionally brought about new issues. The article's principal center is monetary bookkeeping. It starts by giving a concise outline of the historical backdrop of both the Web and monetary bookkeeping. Then, it discusses how the idea of bookkeeping has changed with regards to an organization climate and inspects the advantages and downsides of intertwining network innovation and monetary bookkeeping. Ultimately, it proposes answers for the monetary bookkeeping issues of the "Internet+" period. Ultimately, to upgrade the expert limit of monetary staff, countermeasures are proposed to address the monetary bookkeeping task in the "Internet+" period.

Keywords: *Internet, Finance, Accounting, Management, Analysis, technology, Financial Management.*

1. INTRODUCTION

Monetary administration in the Web time offers exceptional advantages over prior big business monetary administration work. These benefits take into consideration careful oversight of the whole monetary administration process and really expand the extent of big business monetary administration. Corporate money the executives makes more data in the Web time, and it needs data to be communicated rapidly. Undertakings should appreciate the meaning of monetary and bookkeeping the executives to advance their functioning model and fulfill the requests of present-day improvement (Figure 1). To boost the workplace generally speaking and really increment the effectiveness of big business monetary administration, organizations should likewise upgrade the dissemination of monetary data and oversee monetary bookkeeping data in a different way.

The essential focal point of big business monetary administration work in Modern times is knowledge, which is both a vital establishment and an unavoidable pattern of the market economy. This approach can assist organizations with turning out to be more serious in the commercial center, make it simpler for significant bookkeeping and monetary divisions to execute logical administration, and give major areas of strength for a to the successful development of monetary bookkeeping. Subsequently, in Modern times, organizations should zero in additional on informationization and clever monetary bookkeeping organization, stay aware of current improvement patterns, and effectively support business advancement.

Figure 1: New model of Financial Accounting.

1.1.Expanded Scope of Financial Management

The monetary bookkeeping the board model has advanced and business the executives proficiency has expanded decisively in Modern times. The greatest adjustment is that it expands the domain of

ISBN - 978-93-95060-79-0

monetary administration and improves its capability. For example, utilizing the Web considers direct administration and obtainment as well as the chance to reprove providers and accordingly deals to keep up with the board honesty.

1.2.Improving The Timelines of Financial Management

Since the main advantages of Web innovation are ongoing and idealness, speeding up is likewise fundamental for monetary bookkeeping the executives undertakings to furnish clients with solid data. Data practicality is a basic part of bookkeeping and monetary administration, and the accessibility of the Web works with the effective satisfaction of this prerequisite. The presentation of Web innovation modifies specialized strategies and makes monetary administration all the more ideal. It likewise increments staff exchange and correspondence. Utilizing the Web, for example, empowers one to organize relevant work materials and track how undertakings are done. It likewise permits one to give criticism to the association on specific work situations, extraordinarily expanding efficiency.

1.3.Orderly Operation within the Enterprise

In the period of the Web, monetary bookkeeping the board occupation might give monetary data rapidly and can be more coordinated and versatile. Venture the board is fixated on monetary bookkeeping the executives' assignments. Assuming we keep on utilizing the obsolete strategy for executing the board, it would be trying to create perceptible administration impacts in big business monetary bookkeeping the executives. Nowadays, Web innovation might be utilized to keep up with the deliberate inner tasks of the association and handle the monetary and business undertakings in a logical way.

Maharashtra is as of now going through a time of fast monetary development, driven by globalization, digitalization, and serious contest. In this powerful market climate, business pioneers face the test of dealing with their endeavors successfully. They should not just think about the conventional variables that shape rivalry, yet additionally influence solid and deft monetary administration rehearses at all levels. This engages chiefs with the monetary data and experiences they need to settle on educated and convenient choices, at last driving business achievement.

ISBN - 978-93-95060-79-0

Figure 2: Traditional financial accounting.

2. OBJECTIVES

- To examine how management trends and financial accounting practises have been impacted by the Internet era.
- To recognise and assess the major technical developments influencing financial reporting and management approaches in the modern digital environment.
- To evaluate how internet-based platforms and tools affect the efficacy and efficiency of financial accounting procedures.
- Investigate how artificial intelligence and data analytics can improve financial management decision-making.
- To look into the potential and problems that the Internet era has brought to financial accounting and management.

3. LITERATURE REVIEW

Gao, J. (2022), highlights the significant influence that this technology paradigm change can have on the effectiveness, precision, and organisational decision-making processes. The central thesis of Gao's argument is that big data has the capacity to completely change the way financial accounting is practised today while also providing a plethora of benefits that go far beyond simple data processing. The central idea of Gao's talk is the significant gains in accuracy and efficiency that big data can make to the handling of financial accounting information. Businesses can optimise their financial operations by utilising real-time processing capabilities and advanced analytics.

Weimei, C. (2021), explores the significant changes occurring in the accounting field, especially the paradigm change caused by artificial intelligence (AI) from traditional financial accounting to the dynamic field of management accounting. Her strong case highlights the growing importance of AI and its complex impact on changing the face of accounting procedures. Weimei incisively suggests that artificial

ISBN - 978-93-95060-79-0

intelligence (AI) has become indispensable in financial accounting, beyond its traditional uses and influencing management accounting as a whole.

Ali & Khan (2022), Shift the focus of the story to how corporate governance can be a powerful tool in the fight against organisational corruption. Their reasoning is based on the idea that clear financial accounting data, supported by strong control systems, empowers stakeholders and acts as a disincentive to engage in fraudulent activity. The paper offers a comprehensive examination of the mutually beneficial relationship that exists between the development of a strong corporate governance framework and a robust anti-corruption defence. According to Ali and Khan, open financial accounting data serves as a fundamental component of corporate governance.

Venter & van Eck (2021), broaden the assurance's purview beyond conventional financial audits to address the growing need for assurance in data integrity, social elements, environmental concerns, and sustainability reporting. According to their analysis, assurance plays a crucial role in the changing corporate reporting landscape by covering a wider range of aspects that are important to stakeholders and the long-term viability of organisations. According to the report, the traditional emphasis on financial audits is insufficient to satisfy the demands of modern stakeholders, who are becoming more and more interested in non-financial aspects of organisational performance.

Diegtiar et al. (2021), Analyse the limitations that traditional accounting methods impose, especially in the context of small and medium-sized enterprises (SMEs). Their research highlights the drawbacks of traditional systems, which may unintentionally ignore the strategic insights and real-time adaptation necessary for the dynamic nature of SMEs by placing too much emphasis on historical data and compliance. The writers push for a radical change in direction of a cutting-edge accounting system designed with SMEs' unique requirements in mind.

Stafi & Stoica (2021), A troubling story about Romanian emergency hospitals is revealed by an insightful investigation, which also highlights the intricate financial-accounting concerns that permeate their operational environment. The writers provide a clear image of the difficulties these vital healthcare

ISBN - 978-93-95060-79-0

organisations face by highlighting problems such insufficient finance, reliance on erratic health insurance, and ineffective resource distribution. Their research acts as a call to action, supporting proactive steps to reduce risks and guarantee the provision of high-quality healthcare services along with financial stability.

4. RESEARCH METHODOLOGY

4.1.Basic Model

A bookkeeping data framework (AIS) contains all bookkeeping information. AIS is a significant use of PC innovation in bookkeeping; it moves bookkeeping from manual to machine accounting, exhibiting that bookkeeping practice should be modernized. Involving PCs for bookkeeping data is its pith. The bookkeeping in-line framework first gathers a portion of the front-end business cycle's bookkeeping related information, then, at that point, performs bookkeeping handling on this information, finishes bookkeeping, produces bookkeeping data, and chiefs utilize this data to settle on business choices. Figure 3 shows AIS job component examination and association.

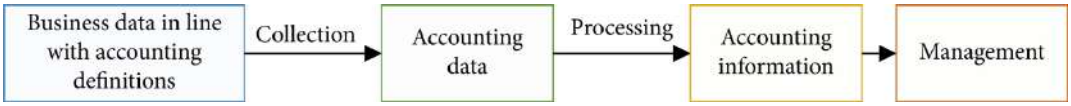

Figure 3: Mechanism of accounting information system.

As indicated by this understanding, the qualification among customary and monetary coordination bookkeeping data frameworks is made by "whether the bookkeeping data framework can understand the sharing of business and monetary information"; Figure 4 delineates the five phases of development that the conventional bookkeeping data framework has gone through.

ISBN - 978-93-95060-79-0

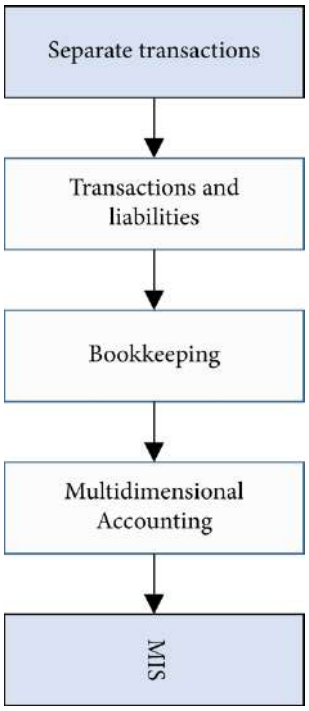

Figure 4: Evolution of traditional AIS.

Business data actually should have been traded between the business and money offices utilizing genuine paper vouchers, despite the fact that the bookkeeping data framework in the initial four stages could record specific business data also. The recording's substance was very restricted. The main distinction between this stage and the past four is the expansion of the front-end business module to the AIS. This assists the AIS record not just business information that consents to bookkeeping definitions yet in addition different sorts of business information, giving chiefs admittance to more extravagant information and making the first business picture more clear.

ISBN - 978-93-95060-79-0

The previously mentioned improvement history of the conventional bookkeeping data framework shows that, while the MIS (the executives data framework) stage can as of now furnish directors with business data, the failure to share business and monetary data brings about a lower level of this data being utilized by supervisors. In this manner, by putting together the customary AIS capabilities as displayed in Figure 5, directors can get to bookkeeping data all the more without any problem.

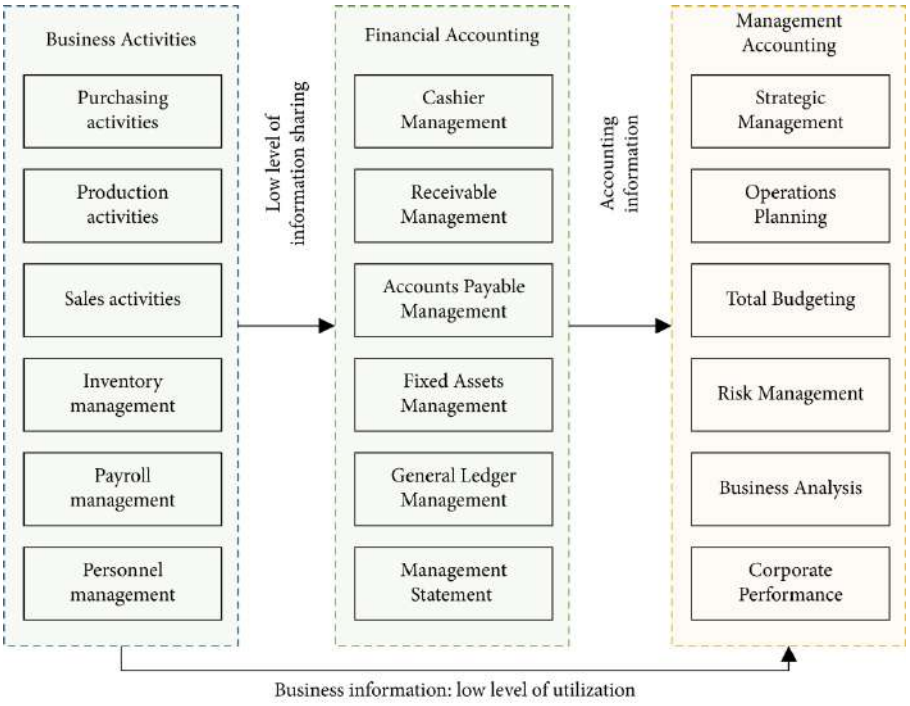

Figure 5: Traditional AIS function diagram.

The creation finance consolidated bookkeeping data framework permits business and monetary information to be shared, defeating the limitation that customary bookkeeping data frameworks could basically utilize bookkeeping information just to participate in administration. It likewise improves the utilization of business information and supports a more significant combination of bookkeeping and the board, which together make bookkeeping a compelling instrument for big business the executives. As Figure 6 delineates, the jobs of monetary bookkeeping and the executives bookkeeping are consequently related and commonly supporting.

ISBN - 978-93-95060-79-0

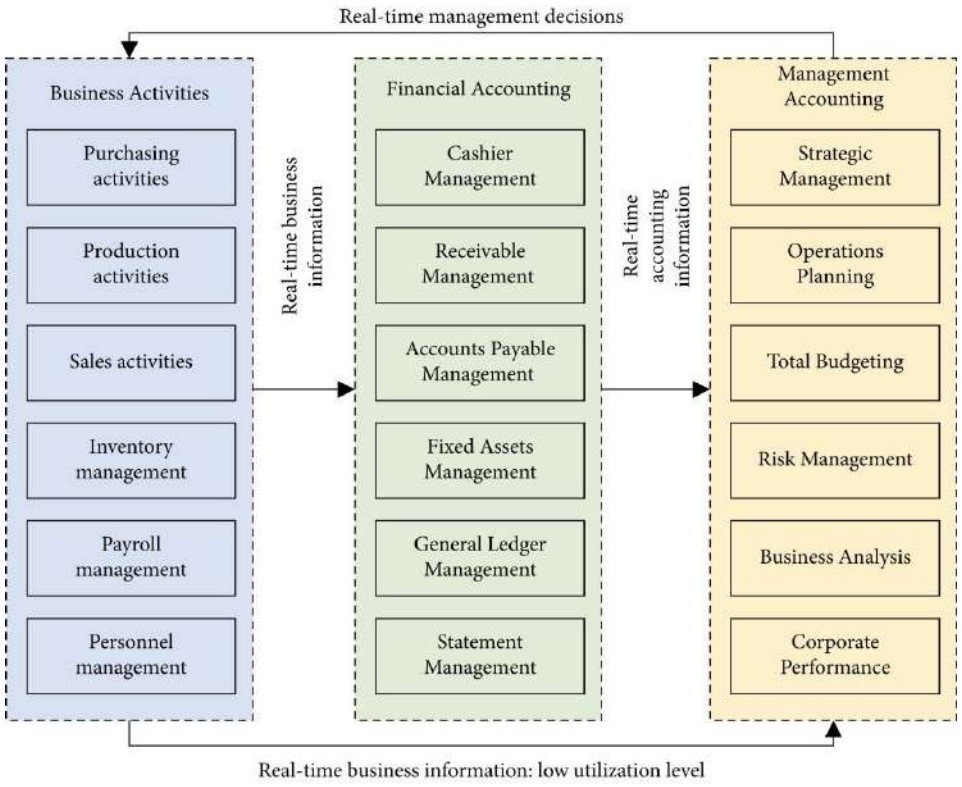

Figure 6: Functional diagram of AIS for business finance integration.

4.2.Improvement Model

In view of the recently referenced issues with resolute administration, rigid bookkeeping, and unbendable business processes during the application cycle, the plan objective of the adaptable monetary joining AIS is to expand the framework's self-flexibility and adaptability to changes in outside necessities, subsequently lessening the time and cost of framework redevelopment. This incorporates adaptable information yield, adaptable info and information structure, adaptable information stream, and adaptable business process.

4.2.1. Flexible Input and Data Structure Design

Regular industry and mix with finance AIS, or the supposition that the default later data set table construction stays unaltered and that the information table in the information things stays unaltered, is commonly restricted to specific data set tables and fields while creating information structure plans. The created framework misses the mark on level of client versatility as far as info and information structure since it is unbending and doesn't represent possible acclimations to the information structure that might be vital coming soon for the

ISBN - 978-93-95060-79-0

venture. Moreover, there is no information space put away for the client to arrange the information structure at the front end.

The "information word reference" capabilities as a "stockroom" for a scope of primary information types. The two tables recorded underneath ought to be incorporated: the detail table, which is utilized to record the names and kinds of fields remembered for every data set table's information things, and the table construction portrayed in Table 1.

Table 1: Table of Contents.

Field Name	**Meaning**
id	Table Number

5. DATA ANALYSIS AND INTERPRETATION

An organization is a sizable, strong, contemporary endeavor bunch. The gathering's improvement was to some degree hampered by the trouble of changing the underlying

ISBN - 978-93-95060-79-0

monetary and plan of action to satisfy the needs of the gathering's administration because of the gathering's sluggish however consistent development in size. Taking advantage of new data innovation apparatuses for change is fundamental if we have any desire to keep awake to date in the Web setting. In Figure 9, we first presentation the different representatives' degrees of acknowledgment for the administration redesign of the monetary bookkeeping framework.

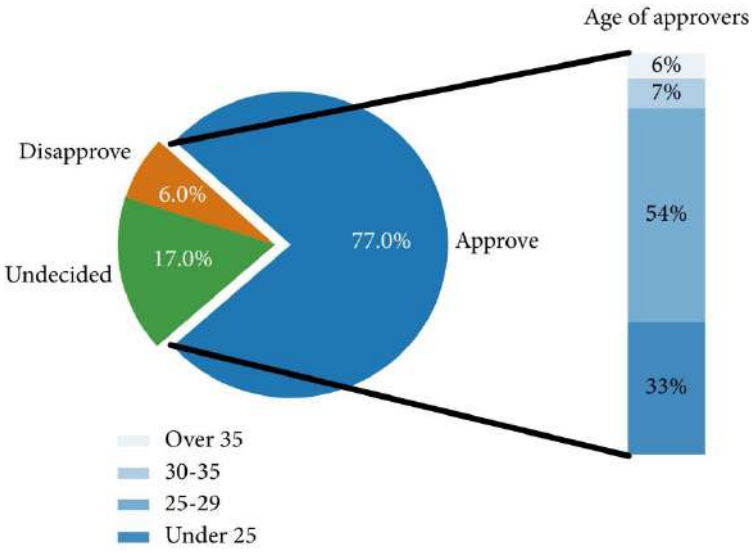

Figure 9: Different employees' opinions on the management upgrading of the financial accounting system.

Before the reception of financial sharing, an organization's finance division was essentially responsible for concentrated financial administration as well as everyday accounting, cost repayment, current record the executives, raising money, activity, venture the board, spending plan the board, charge revealing, explanation readiness and investigation, and different undertakings. The gathering transformed and embraced the hierarchical type of gathering client divisions, and laid out financial divisions inside every division; from a unified financial administration mode to a decentralized financial administration mode, each divisional financial division is liable for its own neighborhood business comparing to the cost repayment accounting and other work. As an organization created, the quantity of auxiliaries, abroad branches, and vital specialty units step by step expanded. Consequently, the accounting branch of every specialty unit presents the handled financial and business investigation information

ISBN - 978-93-95060-79-0

to the central command bunch for information accumulation and examination. Every specialty unit then, at that point, regularly sends business-related information to the accounting staff of the specialty unit.

5.1.Analysis of the Main Problems of a Company before the Integration of Industry and Finance

1) Low Value Creation and High Labour Costs. The client specialty units of a firm lay out a similar capability as the finance division: making a finance division without any preparation is work and time-escalated, and having a major number of accounting laborers raises working expenses for the gathering. Accounting representatives struggle with pulling out from organization the board and supporting business system the executives because of the enormous accounting volume of each finance division.
2) Ineffective Information Exchange. Initial, an organization relegates accounting staff individuals with comparable obligations to different gathering client divisions. Divisional accounting staff individuals then, at that point, aggregate and assess the financial information prior to sending it to the gathering central command. This cycle can bring about staff redundancies and postponed financial information assortment from the gathering central command, as well as functional blunders and issues like data lopsidedness among on the web and disconnected. Second, the center information can't be consolidated and unified in a similar framework for business examination and the executives, nor is there a successful correspondence system among business and financial data.

5.2.Implementation of a Company's Financial Integration in the Internet Era

An organization uses the financial sharing stage to its fullest likely to accomplish the combination of finance and business for the board strengthening. An incorporated and brought together accounting stage based on front-end business get through is an organization's financial sharing place. An immense measure of information assets are accumulated and placed into the information stage continuously to store the data. The put away information are then separated, summed up, allotted, offset and solidified, and changed over into type. All exchanges, solicitations, compromises, installments, and other front-end processes are

ISBN - 978-93-95060-79-0

gathered as information assortment focuses. The administration aspect is utilized to gather and present the removed, accumulated, allocated, offset and solidified, changed over information.

The common finance place has laid out complex responsibility markers and examination frameworks relating to fundamental business pay, benefit before charge, working net income, significant quality issues at the activity, the board, and dynamic levels, individually, and has fabricated a multi-layered pointer investigation framework in view of the gathering's financial sharing bound together information stage. Moreover, the framework utilizes the gathering's huge information stage for investigation and show. We analyze the association among business and financial administration in Figure 10.

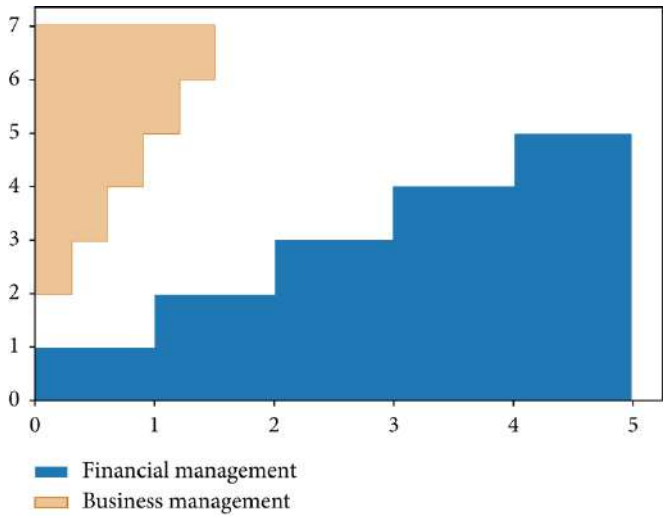

Figure 10: The value of financial management with business management.

The common finance place has laid out complex responsibility pointers and investigation frameworks comparing to primary business pay, benefit before charge, working net income, significant quality issues at the activity, the board, and dynamic levels, individually, and has fabricated a multi-faceted marker examination framework in view of the gathering's financial sharing bound together information stage. Moreover, the framework utilizes the gathering's enormous information stage for examination and show.

An organization's inward financial sharing community stage reshaped the financial interaction and afterward brought together everything, concealing data on significant connections so financial principles completely pervade the connected exchange process. This superior the

ISBN - 978-93-95060-79-0

effectiveness and practicality of information arrangement and laid areas of strength for an establishment for the gathering's later month to month compromise and information the board investigation. It likewise resolves the issues raised by the decentralized financial administration model's low endeavor esteem creation and high work costs. Two arrangements of financial reports in light of the corporate construction and the board reports in view of the administration design can likewise be created by the sharing community. The gathering can screen the exact execution of the financial plan progressively and offer huge help to bunch administrators and leaders with the arrival of the working financial plan execution report continuously following the coordination of industry and finance.

6. RECOMMENDATIONS & CONCLUSION

Ventures need to reinforce the advancement of the financial accounting the board mode to help with meeting the improvement needs of the times. All in all, financial accounting the board is fundamental for organizations, and it fills in as the establishment for the advancement of organizations, especially in the period of the Web. Nonetheless, right now, it is trying to adjust crafted by an organizations' financial accounting the executives to the improvement of the organization period, and the administration thought has not been refreshed as soon a possible. Ventures need to focus harder on this, settle on choices that are sensible to upgrade it, and further grow the field of financial accounting the executives by fortifying the development of data innovation and explaining the issues that are as yet exceptional. This will permit endeavors to get new turns of events and work fair and square of financial accounting the executives in an exhaustive way.

Recommendations:

- **Embrace Technological Integration in Financial Reporting:** Leverage modern accounting information systems (AIS) to seamlessly integrate front-end business cycle data, ensuring efficient and accurate financial reporting.
- **Address Challenges and Unleash Potential in the Internet Era:** Conduct a comprehensive analysis of the challenges and opportunities presented by the Internet era in financial accounting and management.

ISBN - 978-93-95060-79-0

- **Recognize the Evolution of Accounting Information Systems:** Acknowledge the historical development of accounting information systems, emphasizing the transition from traditional to modern practices.
- **Maximize Efficiency with Internet-Based Platforms:** Enhance the efficacy of financial accounting procedures by incorporating internet-based platforms and tools.
- **Harness Artificial Intelligence for Informed Decision-Making:** Explore the transformative power of artificial intelligence (AI) and data analytics in financial management. Implementing AI tools enhances decision-making processes by providing managers with access to richer data sets.

Abstract

In Maharashtra, India, Micro, Small, and Medium-Sized Enterprises (MSMEs) are fundamental for the economy since they give occupations, convey pay, battle neediness, and lift sends out. To guarantee impartial and reasonable advancement in the state and to advance grassroots monetary development, their effect on business, industry, and the country economy is fundamental. Accounting assumes a fundamental part in corporate tasks by offering a financial outline that works with dynamic on the present and expected future strength of organizations. With MSMEs assuming such an imperative part in Maharashtra's economy, this turns out to be significantly more significant. There is an observable disparity between accounting hypothesis and genuine practices, by and by, as confirmed by the limitations in the execution of accounting procedures in MSMEs in Maharashtra and all through India. This exploration article endeavors to analyze the accounting practices followed by MSMEs in Maharashtra, India, considering the significance of keeping exact books of records and following sound accounting standards for proficient financial administration in MSMEs. To give light on the current state of accounting practices inside the MSME area in Maharashtra and to offer experiences for future enhancements, the review will gather information through reactions to an organized meeting plan. The Maharashtra State Chamber of Commerce and Industries (MSCCI) and the Institute of Chartered Accountants of India (ICAI) could cooperate to organize the executives and financial record-continuing to prepare programs that are custom-made particularly for MSME chiefs and owners to resolve these issues. To give members the capacities and information expected to dissect financial information, screen business execution, and use sound judgment for long haul development, these projects should go past basic accounting.

Keywords: *Financial Accounting, Strategies, Accounting Information, Accounting Practices, Accounting records, Micro, Small and Medium Scale Enterprises (MSMEs), Owner-Managers.*

1. INTRODUCTION

Micro, Small, and Medium-Sized Enterprises (MSMEs) are basic to a country's monetary development. Strategy producers find MSMEs engaging since they might create occupations in different regions and with negligible capital. After the agribusiness area, this one records for the second most noteworthy work supplier. MSMEs make up among half and 66% of all enterprises around the world, and in numerous nations, this rate is essentially more noteworthy. MSMEs represent the second most prominent portion of work in India, after farming.

MSMEs, which are normally recognized as drivers of financial extension, are fundamental to advancing fair advancement in Maharashtra, India. Second just to horticulture as far as occupation creation, the business has arisen as a key part in the financial landscape of the state. Maharashtra's MSMEs assume a huge part in the state's work creation process by helping modern movement in provincial and immature regions and supporting worth expansion, neighborhood capital preparation, and the improvement of enterprising abilities. The MSME area arises as a beam of expectation for keeping up with lives while the coordinated assembling area deteriorates and the rural area perseveres through a drop in work.

The adage "Cash makes the world go around" is precise in the speedy universe of business, especially for Maharashtran organizations. One significant variable that decides a business' drawn out presentation is its financial administration. A solid accounting framework, wherein each financial detail is meticulously reported in firm records as per accounting standards, is the foundation of financial administration. Maharashtra's MSME owners need current, precise, and ideal accounting information to flourish. The establishment for surveying and conveying the financial strength of the business is accounting information, which upholds the executives' independent direction.

Accounting practices inside the area should give intensive and relevant financial information that is fundamental for enterprising independent direction, given its huge effect on the outcome of MSMEs. Severe record-keeping strategies are important to work on the profitability and supportability of MSMEs in Maharashtra

ISBN - 978-93-95060-79-0

and permit owners to follow and survey their organizations' exhibition. To give knowledge into MSMEs' financial administration techniques, this article will look at their accounting practices in the Maharashtra climate.

A huge piece of creation and commodities come from this area. By making a lot of work prospects, industrializing country and immature regions, achieving a fair circulation of riches and public pay, and supporting the country's financial development, it enormously helps the Indian economy. The business likewise made a commitment to the country's Gross domestic product. The advantages of the MSME area incorporate effective utilization of locally accessible assets, decreased speculation needs, functional adaptability, and a high pace of development. The public authority has given MSMEs a scope of help to advance their development and improvement.

When the public authority acknowledged how significant and important MSMEs were to the economy, it passed the MSME Advancement Act, 2006. To further develop MSMEs, various panels have been laid out, and various examinations have been done. By and by, the business actually faces various difficulties, for example, tracking down the vital subsidizing, issues with unrefined substances, issues with below average accounting systems, and so on. The presence and profitability of MSMEs are vigorously reliant upon the compelling administration of their financial assets, making insufficient financial administration one of the many significant issues they stand up to.

Many believe money to be the backbone of an organization. Each step of the improvement of a firm requires supporting. Any kind of business' capacity to stay in activity and succeed is basically reliant upon its financial administration. Subsequently, powerful financial asset the executives and financial discipline are fundamental for a business' prosperity.

The MSME Improvement Act, 2006 states that an organization that makes and creates merchandise and contributes something like 25 lakh rupees in plant and hardware is delegated a micro undertaking; those that contribute more than 25 lakh rupees however don't surpass five crore rupees are named small enterprises; and those that contribute in excess of five crore rupees yet don't surpass ten crore rupees are delegated medium enterprises. Notwithstanding, for

ISBN - 978-93-95060-79-0

organizations that offer or render benefits, the greatest measure of cash that can be put resources into hardware is 10 lakh rupees. is alluded to as a micro endeavor when its income outperforms ten lakh rupees yet remains under two crore rupees. is named a small firm, and those that make multiple crore rupees however under five crore rupees are delegated medium enterprises.

Maharashtra's MSME area has been fundamental in supporting the state's economy by giving business open doors to a sizable section of the general population. These organizations utilize assets that are promptly accessible locally, showing creativity and resourcefulness in their tasks. MSMEs in Maharashtra actually face a few hindrances, even with the different government drives pointed toward supporting the business. Financial administration stands out among the numerous issues these organizations defy as perhaps of the main one that can't be ignored in light of its huge effect on an organization's capacity to succeed or come up short. To effectively handle these issues, cautious oversight of the business' funds and powerful administration are fundamental.

Accordingly, the motivation behind this study is to investigate the financial administration strategies utilized by Maharashtra's micro and small organizations. The review takes a gander at current inadequacies and impediments that entrepreneurs have while dealing with their funds, and it recommends ways of moving beyond these issues. By doing this, the review desires to empower the business to work on its ability for successfully handling financial issues, hence supporting the thriving of Maharashtra's enterprises all in all.

2. OBJECTIVES

- To assess the current financial accounting practices employed by MSMEs in Maharashtra to understand their adherence to accounting standards.
- To examine the challenges faced by MSMEs in Maharashtra related to financial accounting and propose strategies for improvement.
- To investigate the impact of effective financial accounting on the overall performance and sustainability of MSMEs in the Maharashtra region.

ISBN - 978-93-95060-79-0

- To provide practical recommendations based on the case study findings to enhance financial accounting practices among MSMEs in Maharashtra, fostering economic growth and stability.

3. LITERATURE REVIEW

Krishna and Pavithran (2018), directed a review to find out about Kerala's SMEs' accounting methodology. They found that most of organizations recently carried out accounting methodology since they needed to, not on the grounds that they comprehended how significant they were. Moreover, they miss the mark on exhaustive understanding of the various declarations and the benefits of setting them up. As indicated by the review, organizations are not involving accounting statements for arranging, contrasting, or simply deciding. Accordingly, the specialists ought to make the fitting move to instruct these entrepreneurs about the worth of an accounting framework and the benefits it can offer.

Mekonnen (2019), More than 50% of the businesses do not maintain their accounting records, according to the paper Accounting Practises of Small and Micro Enterprises in North Shewa Zone, Amahara Regional State of Ethiopia. Reasons for this lack of record-keeping include labor-intensiveness, increased costs, lack of accounting expertise, and time waste. Even record preparers are not knowledgeable about accounting.

Aher, R. V., & Dongare, S. D. (2022), The financial management techniques of MSMEs in Maharashtra's Nashik District are investigated in this study. The authors discover that a large number of MSMEs rely solely on personal records and instinct when making decisions because they lack proper financial management systems. In order to enhance their financial performance and funding accessibility, they advise MSMEs to implement more formal accounting procedures.

Bhosale, S., & Pawar, M. S. (2021), The potential and difficulties MSMEs in Maharashtra have when implementing accounting information systems (AIS) are examined in this study. The authors list a number of things that prevent adoption, including expense, ignorance, and a lack of technical know-how. They also draw attention to the advantages that AIS may offer, including better decision-making, financial reporting, and capital availability.

ISBN - 978-93-95060-79-0

Patil, S. B., & Jadhav, S. S. (2020), This study looks into the variables affecting MSMEs' financial performance in Maharashtra's Solapur District. The success of MSME is shown to be significantly influenced by elements including marketing tactics, human resource management, and financial accessibility. They advise policymakers to concentrate on offering assistance in these areas in order to raise the sector's overall performance.

Deshmukh, S. S., & Kulkarni, S. V. (2019), The financial management techniques of MSMEs in Pune District, Maharashtra, are examined in this study. The authors discover that a large number of MSMEs lack professional accounting staff and depend on unofficial financial management techniques. They contend that in order to enhance MSMEs' financial management procedures, training courses and financial literacy campaigns are essential.

4. RESEARCH METHODOLOGY

The core data for the current study was gathered using organised schedules, and secondary data sources were also consulted. MSMEs are actively engaged in 17 different economic areas in Maharashtra, India. Automobile parts, chemicals (soap, washing powder), machinery parts for construction equipment, fabricated metal products (welding, grilling, lathe works), aluminium vessels, utensils, rice mills, paddy hulling, non-metallic minerals, paper products, plastics, safety pins, stationery products, textile mills, tyre products, and wax and wood products are some examples of these operations. All 75 of the manufacturing firms in the state that are registered and are in operation have been chosen for analysis in order to learn more about the accounting procedures used by MSMEs in Maharashtra. Simple percentage analysis is used in the study to extract meaningful information from the gathered data.

5. DATA ANALYSIS AND INTERPRETATION

Table 1 presents the findings of the respondents' demographic profile.

Table 1: Demographic Profile of the Respondents.

Variables	Frequency (N=75)	Percentage (%)
Gender		

ISBN - 978-93-95060-79-0

Male	50	66.67
Female	25	33.33
Total	75	100
Age		
Below 25	9	12
26-35	19	25.33
36-45	33	44
46-55	13	17.33
56 and above	1	1.34
Level of Education		
SSLC	4	5.33
HSC	12	16
UG	26	34.67
PG	5	6.67
Diploma	21	28
Others (Elementary, School dropouts)	7	9.33
Experience		
Below 10 years	38	50.67
10-20 years	19	25.33
21-30 years	14	18.67
31-40 years	3	4
Above 40 years	1	1.33

The demographic profile of the 75 study participants is shown in the table, offering important details about age, gender, experience, and educational attainment. When it comes to the gender distribution of the sample, 66.67% of the respondents are men, while the remaining 33.33% are women. The respondents' ages range widely, with the age group of 36–45 accounting for the largest number (44%), followed by 26–35 (25.33%) and 46–55 (17.33%). Individuals under 25 comprise 12% of the population, while those 56 and over make up a lower percentage (1.34%).

ISBN - 978-93-95060-79-0

The respondents' degrees of education vary; the majority (34.67%) have an undergraduate degree, followed by those with a diploma (28%), and those with higher secondary education (16%). Postgraduates (6.67%), holders of an SSLC (5.33%), and respondents with various educational backgrounds, such as elementary school and school dropouts (9.33%), are represented in smaller percentages.

Regarding work experience, 50.67% of respondents had less than ten years' worth, while 25.33% had between ten and twenty years' worth. 18.67% of respondents had between 21 and 30 years of experience, while a smaller fraction have between 31 and 40 years of experience (4%) and over 40 years of experience (1.33%). Thus, the demographic profile offers a thorough summary of the traits of the respondents and serves as a basis for additional research and interpretation throughout the study.

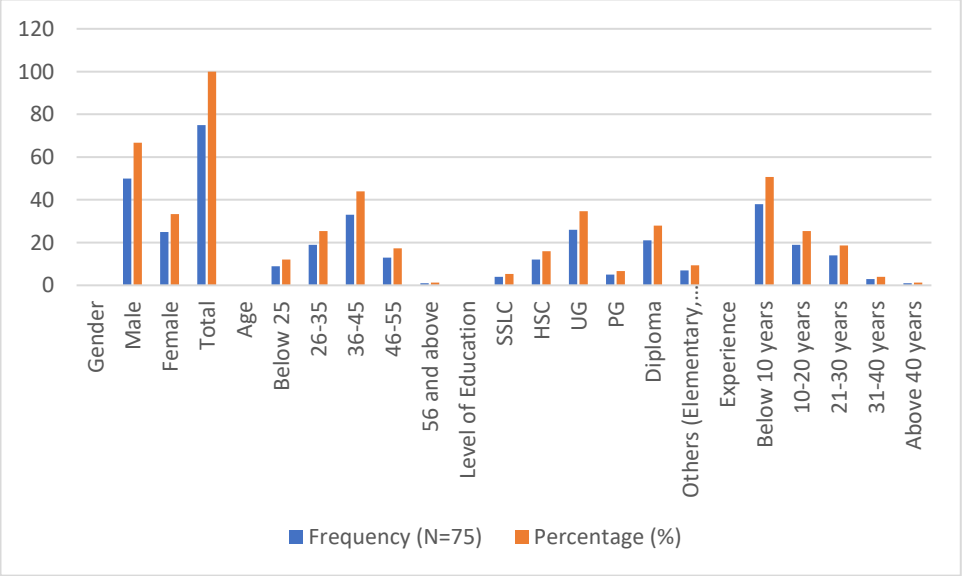

Figure 1: Demographic Profile of the Respondents.

Table 2 presents the respondents' enterprise profile results..

Table 2: Enterprise Profile of the Respondents.

Variables	Frequency (N=75)	Percentage (%)
Category		
Micro	66	88

ISBN - 978-93-95060-79-0

Small	7	9.33
Medium	2	2.67
Total	75	100
Ownership		
Sole Proprietorship	66	88
Partnership	6	8
Private Limited	3	4
Investment		
Below lakh	20	26.67
1-50 lakhs	49	65.33
50-1 Crore	4	5.33
Above Crore	2	2.67
Number of Employees		
Below 25	71	94.67
26-50	1	1.33
Above 50	3	4

The table gives a thorough summary of the respondents' enterprise profiles and highlights important details including category, ownership, investment, and workforce size. The majority of the 75 businesses that were polled (N = 75) fit into the "Micro" category, making up 88% of the total, followed by "Small" businesses (9.33%) and "Medium" businesses (2.67%). When it comes to ownership, "Sole Proprietorship" makes up 88% of all ownership, followed by "Partnership" (8%), and "Private Limited" (4%).

According to the distribution of investments, a significant number of businesses have investments between less than one lakh and fifty lakhs, with 26.67% of them falling into the former category and 65.33% into the latter. Less than half of the businesses, or 5.33%, have investments between 50 lakhs and one crore, while 2.67% have investments greater than one crore.

When the number of employees is looked at, 94.67% of the businesses employ fewer than 25 people. The proportion of businesses with 26–50 employees is quite low (1.33%), while 4%

ISBN - 978-93-95060-79-0

of them employ more than 50 people. This breakdown gives a clear picture of how the 75 respondents' sample of businesses are distributed according to employee strength, ownership structure, category, and investment levels.

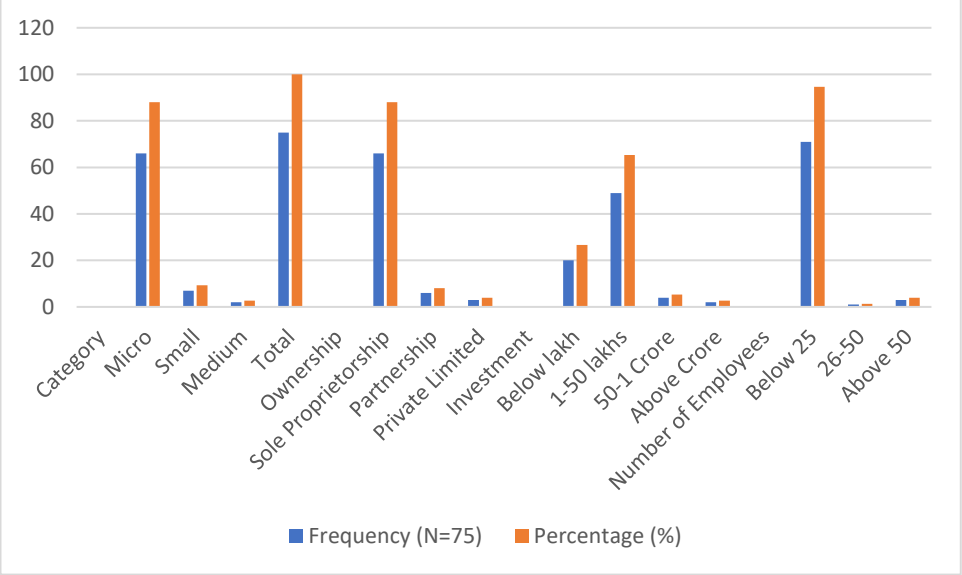

Figure 2: Enterprise Profile of the Respondents.

Table 3: Response to the question of whether the company uses a systematic accounting system (N=75).

Accounting System	Frequency (N)	Percentage (%)
Yes	69	92
No	6	8
Total	75	100

The responses to the question of whether businesses use a systematic accounting system are shown in the table, which also shows a noteworthy trend. 92% of the 75 responses in all suggest that businesses follow a systematic accounting system. This is the overwhelming majority. This high percentage indicates that the surveyed companies have a commendable level of dedication to implementing systematic and rigorous accounting practises. Conversely, a minority, making about 8% of the participants, stated that they lacked a structured bookkeeping system.

ISBN - 978-93-95060-79-0

The fact that the vast majority of businesses claim that they employ a systematic accounting system shows how important structured financial management is to these businesses. This encouraging trend might represent a dedication to financial accountability, precision, and transparency—all essential components for efficient operations and decision-making in the business world. It is important to emphasise the need for focused interventions or support mechanisms to improve accounting standards among this subset of businesses, as the existence of a small fraction of businesses without a systematic accounting system suggests a possible area for improvement in the adoption of best practises. Overall, the table indicates that the assessed firms generally adhere to systematic accounting practises; nevertheless, there is still opportunity for targeted initiatives to better promote these practises throughout the board.

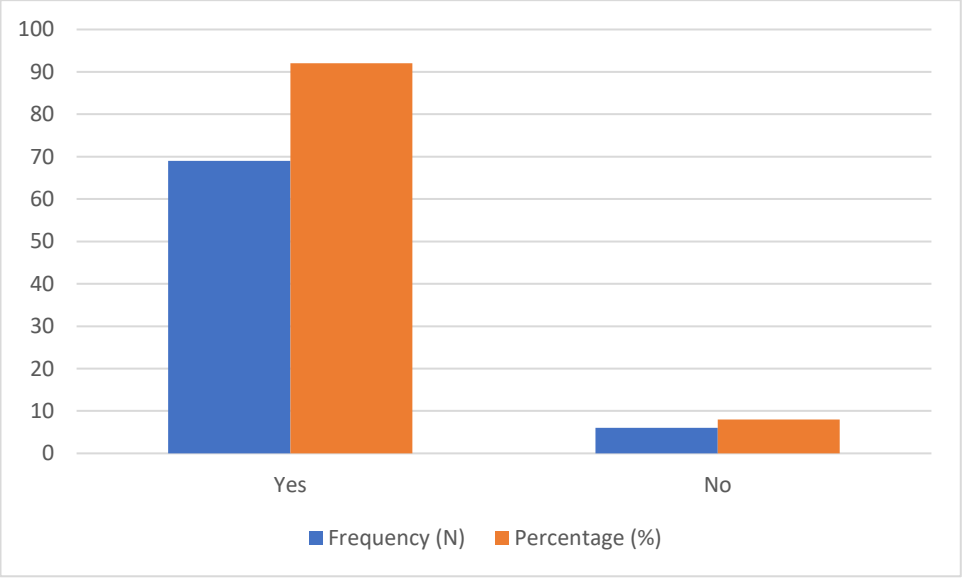

Figure 3: Response to the question of whether the company uses a systematic accounting system (N=75).

Table 4: Response to the company's adherence to the bookkeeping system.

Book Keeping	Frequency (N)	Percentage (%)
Double Entry System	18	25.71
Single Entry System	52	74.29
Total	70	100

ISBN - 978-93-95060-79-0

Responses to questions about the bookkeeping systems used by the surveyed businesses are displayed in the table, with particular attention paid to whether the businesses use a Double Entry System or a Single Entry System. Of the seventy-one businesses that were polled, twenty-seven percent (18 businesses) reported using the Double Entry System, while seventy-two percent (74.29%) of the businesses reported using the Single-Entry System.

Based on the data, it appears that the Maharashtra, India, surveyed firms favoured the Single-Entry System over the Double Entry System. The Single-Entry System is a less complex approach that simply keeps track of one entry every transaction. Its popularity may be attributed to its simplicity and fit for smaller companies. Conversely, a comparatively lower percentage of businesses use the Double Entry System, which is renowned for its thorough methodology that records both debit and credit entries for every transaction.

The difference in adoption rates suggests that the MSME sector in Maharashtra has a variety of bookkeeping practises, most of which favour efficiency and simplicity in their record-keeping techniques. The results highlight the necessity of customised financial management plans and support systems that correspond with the most common bookkeeping practises among MSMEs in the area.

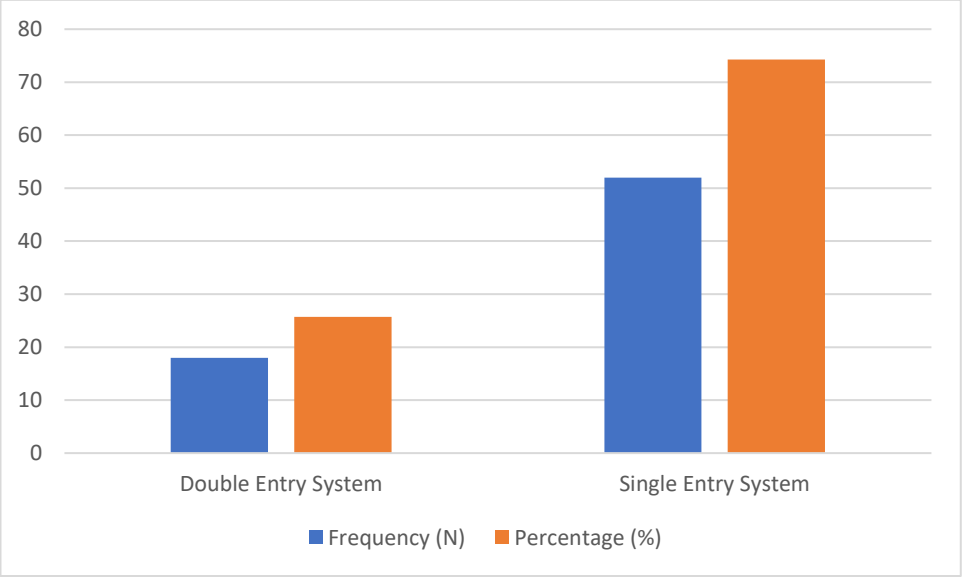

Figure 4: Response to the company's adherence to the bookkeeping system.

6. RECOMMENDATIONS AND CONCLUSION

ISBN - 978-93-95060-79-0

The results of the field survey conducted in Maharashtra, India, indicate that a sizable portion of Micro and Small Enterprises (MSEs) do not have thorough accounting records (75%). This highlights a significant discrepancy between the theory of financial management and its actual application in the MSE industry. As a result, this study makes practical suggestions suited to the Maharashtra environment. It is recommended that the District Industries Centre (DIC) officials in Maharashtra develop detailed rules and provide MSEs with standardised forms for entering accounting information in order to close the observed gap. Furthermore, it is advised that training initiatives be put in place to educate MSE owners on the value of keeping correct books of accounts. It is also suggested that MSEs make record-keeping obligatory in order to improve their accounting procedures. This programme helps the government raise more money through taxes while also ensuring that income is declared accurately. Mandatory record-keeping also influences important government policy by providing vital data for national income accounting. The goal of these suggestions is to close the gap that currently exists between financial management theory and the day-to-day struggles that MSEs in Maharashtra experience.

Recommendations:

- **Enhance Awareness and Training Programs:** Recommend the implementation of awareness and training programs for MSMEs in Maharashtra to enhance their understanding and adherence to financial accounting standards.
- **Establish Industry-Specific Accounting Guidelines:** Suggest the development of industry-specific accounting guidelines tailored to the diverse sectors in which MSMEs operate in Maharashtra.
- **Promote Technology Adoption for Accounting:** Encourage the use of accounting software and digital tools that can streamline financial processes, improve accuracy, and provide real-time insights.
- **Facilitate Networking and Knowledge Sharing:** Recommend the establishment of forums or networks that facilitate knowledge sharing and collaboration among MSMEs in Maharashtra.

ISBN - 978-93-95060-79-0

- **Government Support and Incentives:** Propose that the government of Maharashtra introduces support mechanisms and incentives to encourage MSMEs to improve their financial accounting practices.

Abstract

In the modern world, it's critical to concentrate on a few company-specific marketing techniques and create a tool for achieving total performance. This study effectively examines how marketing strategies affect the company's sales success. After the study was finished, it was examined to determine how to manage the plan and function efficiently by obtaining the entire sales and revenue performance of the organisation. Analysis reveals that marketing is beneficial to all sizes of businesses, including global conglomerates and small and medium-sized enterprises. Virtuoso has been selected as the subject of this research project, and it has been successful in assessing sales performance while utilising the best possible marketing techniques. In order to collect data sources for analysis and to meet research objectives, a questionnaire has been chosen for this study. Finally, the data were analysed correctly to finish the research with the aid of several technological analyses and SPSS software. While most countries in the globe are aware of the importance of marketing research to a company's ability to survive, some of our indigenous business owners are still unaware of this. Only a small number of companies who express interest in these studies really use them on a regular basis. Because the information was never fully used, marketing judgements were made on fictitious data. Businesses need to provide goods and services that consumers will continue to be interested in if they hope to enhance product performance and establish a strong competitive advantage in the market. The study looked at how marketing research affects productivity inside a business.

Keywords: *Marketing, Performance, Effective, Accomplished, Analysis, Multinational Companies, Sales Research, Market Research.*

1. INTRODUCTION

The majority of research assert that various markets throughout the globe are beneficial and efficient for a company's expansion. It may have to do with meeting consumer demands and developing the low-cost positioning strategy in a useful and efficient manner. In order to create standardised national borders and control the products through various price, location, and product strategies, it is necessary to govern society, gather resources for managing the business, and pursue global strategies.

The method involved with managing worldwide marketing procedure and making productive marketing cycles can be successfully applied to managing normalization. These processes have resulted in standardised products that are sold across national borders and utilised in various management practises. The study's development of an efficient strategy and the management of basic processes are crucial for managing the worldwide marketing process in a more efficient manner. These may be viewed as controlling the interaction between sales and marketing, and they would be appreciative of the analysis of business performance and the management of the business unit through market management operations.

Two distinct ideas and management approaches are linked to increasing the number of items and offerings, setting prices, and controlling the promotional mix in order to improve the performance of the company. Marketing strategies must be managed, sales performance must be grounded, resources must be completed, and marketing mix theory must be managed using various conceptual data. Remembered for this exploration report is Virtuoso, a worldwide stage partnership with a solid mechanical office that fundamentally focuses on computerized streaming, web based business, distributed computing, and man-made consciousness as idea sources.

According to analysis, these marketing strategies are typically linked to the management of conventional variables and the creation of blueprints for various corporate operations. These work well and are beneficial in controlling success progressively and creating business concepts through various processing techniques. In the present corporate world, how well it performs relies upon whether

ISBN - 978-93-95060-79-0

marketing strategies are utilized as advanced or online entertainment marketing. Lastly, it can be concluded that the marketing department of businesses plays a crucial role in identifying new clients, establishing the brand's value in the marketplace, and utilising cutting-edge technology to promote the business's goods and services.

The field of marketing has demonstrated to be dynamic for various years. Its development from basic trading tasks to a complicated design that is believed to be fundamental for an association's prosperity is evidence of its relevance. Every organisation needs marketing to survive, and the extent to which an organisation can provide potential clients with its goods or services determines how successful that marketing will be. For a long time, directing marketing research has been a fundamental piece of managing a firm.

Its development was accelerated by the industrial revolution, which brought about a wide range of new and diverse consumer products, enhanced economies of scale, emerging markets, and a general expansion in business operations. Research into marketing activities was at its foundational level during this time and remained unexplored for several centuries. Until the end of World War II, it constituted a negligible portion of firms' marketing strategies. An important post-war development was the rise in the number of corporate failures. A dynamic commercial activity is marketing.

Because of the increasing instances of economic crisis, inflation, shortages of materials and energy, unemployment, closure of businesses and industries, terrorism, and war, its functions in the functioning of a corporation have changed dramatically. Additionally, the advent of the internet has brought about improvements in technological growth that can also be ascribed to this. Because of all of this, marketing professionals are now compelled to base more of their strategic decisions on the market. This calls for a formal way to get accurate and timely data about shifting consumer preferences, product needs, and the overall marketing landscape, and this can only be done with thorough marketing research.

To fulfill their clients and get their committed help, all contemporary organizations elevate to them. Banks do marketing exploration to find out about the monetary help needs of their clients;

ISBN - 978-93-95060-79-0

Dangote Flour Factories conducts marketing examination to find out about the necessities and prerequisites of flour clients; and Inland Income conducts statistical surveying to find out about the necessities and prerequisites of citizens and different clients. At the point when there is no guaranteed market for an item, there is no utilization in creating it.

Moreover, an imaginative thought is useless on the off chance that it can't be transformed into a financially reasonable item. Since it is the main way for organizations to obtain notoriety, generosity, and customer steadfastness, an attractive item is urgent to their endurance. The objective market's perspective and conclusions should be thought about to create an item that will be economically reasonable. This can be accomplished by information social affair, examination, and utilization of the discoveries to authoritative independent direction. Marketing research is one of the principal ways that an association accumulates data for choices that are both effective and proficient.

Since it is accepted that marketing research propels the achievement of adequacy and proficiency in business associations, an assessment of the effect of marketing research on hierarchical efficiency is thought important. While most countries in the globe understand the need of marketing research for a company's existence, some of our indigenous business owners are still unaware of this. Only a small number of companies who express interest in these studies really use them on a regular basis. Because the information has never been fully used, they are making decisions about the market and marketing that are based on false information.

- **Three key insights on how marketing impacts the company's sales success**

a) **Increasing opportunities:** Sales cannot increase brand consideration rates significantly without the help of marketing. The company's unassisted product awareness rate in Maharashtra was 63% as opposed to 87%, which was lower than the market leader's. The company's consideration rate was 45%, while the top competitor's rate was 87%. This difference grew even more.

Research showed that, even in the presence of a robust sales culture,

ISBN - 978-93-95060-79-0

purchase decisions were not significantly influenced by the sales team's relationship. Data indicated that sales personnel had little effect on how customers perceived their offerings. Furthermore, a new customer segment that the current sales team had not yet touched was discovered.

The business raised its marketing budget and purposefully diverted funds from events to digital marketing campaigns after seeing the need to go beyond conventional sales tactics. This involved making purchases of webcasts, videos, and a specialised website that catered to the newly defined buyer niche.

b) **Sales Coverage:** The impression of increased sales coverage can be produced by increased marketing efforts. In a 90-day period, buyers were asked how frequently they visited a salesperson. They reported seeing company representatives 0.8 times on average, or around once every quarter, and 2.5 times, or nearly once a month, when it came to visits from the top competitor's representatives. Buyers reported meeting company representatives 2.4 times each quarter two years later, which is comparable to rival companies. Buyers observed a rise in visits as a result of the increased marketing activities, even though the number of representatives in the segment did not change over the course of the two-year period.

c) **Sales Enablement:** Changes in consumer behaviour can be detected by marketing. All phases of the funnel had seen an improvement in the company's performance, with the exception of existing accounts. Customers are now more "price sensitive," according to representatives, and rivals are undercutting them. Even if the company led the industry in product sales, the senior management group continued to view technological innovation as the primary motivator.

ISBN - 978-93-95060-79-0

Subsequent investigation revealed that the sales force was correct. Buyers' priorities had changed. Buyers had changed, far more quickly than anyone had anticipated, thanks to changes in reimbursement, healthcare reform, and a strong rival campaign against overspending on technology.

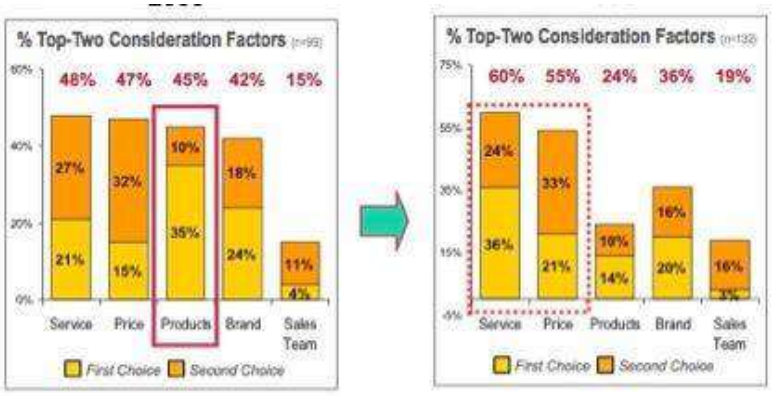

Figure 1: Impact.

Sales collateral and the value proposition therefore needed to be updated promptly. The focus shifted from praising innovation to providing buyers with justification for their investment, with resources such as ROI models and product configurators replacing bells and whistles.

2. OBJECTIVES

- To assess the relationship between particular marketing tactics and the variations in sales success that correspond with them.
- To examine how customers, react to various marketing channels and assess how that affects overall sales.
- To look into how well different marketing initiatives may increase revenue and penetrate new markets.
- To investigate how customer purchasing decisions and ensuing sales outcomes are influenced by brand awareness and perception.
- To evaluate how digital marketing initiatives, affect both online and offline sales success.

3. LITERATURE REVIEW

O'Dwyer (2022), The function of a business owner is helpful in controlling the expansion of various marketing systems and inefficient resources that are necessary for controlling crucial elements of key systems in firms. A variety of firms should be taken into account when applying to obtain various insights in a useful and

ISBN - 978-93-95060-79-0

efficient way. There are several advantages of taking into account various marketing tactics for the company's sales success.

KIM, JUN and HYUN (2022), Growing sales volume is the first advantage since it allows for the management of marketing strategies and successful sales. It is necessary to boost sales and treat current clients as if they were previous clients. It is linked to the planning and management of corporate operations and is cautious as the primary advantage of effectively comprehending the memorable. Using and managing different notorieties to be viewed as quite possibly of the most helpful and positive standing and oversee considered in a more fitting manner is one more benefit that the organization utilized by having a marketing strategy.

Gillum (2022), with the aid of efficient marketing resources and handle the ideas that are beneficial for several important aspects. Numerous perspectives highlight the significance of marketing and how it affects the company's sales. Compelling open doors that are useful in producing deals and effectively progressing for more noteworthy thought rates are expanded by the effect of marketing. For controlling society to be viewed as valuable and powerful, the business expected to produce huge deals. Another impact is that it helps cover deals, capabilities as a marketing action, and cultivates the possibility of higher, more deals and inclusion.

Kusumawati, et.al. (2022), Marketing, its character purchasing conduct, and the exhibition really are connected to the third high effect of marketing procedures on the organization's deals execution. Managing the idea of cost responsiveness, making solid contenders who offset jobs, and fostering a pioneer inside the association are vital. Every one of them have areas of strength for a to helping to establish and managing research with the deals procedure that is utilized and has been changed in accordance with meet their market needs.

Onwad (2022), One of the most practical and efficient ways to manage resources, get high advertising planning, prepare marketing instruments, and carry out marketing plans is through marketing. An additional method for overseeing home-based business associations and creating low-cost resources to oversee marketing advantages. It also aids in anticipating how the business will manage to take part in the

ISBN - 978-93-95060-79-0

schemes and revenues that cause disruption in society.

Sung (2022), Effective social media platforms are another tactic Virtuoso employs to control variation and finish the social media planning. The marketing plan was facilitated by these procedures for thoroughly considering marketing rope and making a notice that would work (Techniques to Further develop Deals Execution, 2022).

(Li, 2022), These techniques for marketing would be helpful and would bring about the creation of great things, which would prompt an expansion in the quantity of different clients and an expansion in income for the organization. Furthermore, it aids the slow management of assets, and it additionally raises the quantity of clients and the augmentation in deals.

4. RESEARCH METHODOLOGY

4.1.Methodology

To complete the examination, there are various unmistakable areas that ought to be respected compelling appropriate assets that are pertinent in the general public. To be more unequivocal, about the framework was laid out and ensuring that the actual review is legitimate to achieve the objectives and goals. The positivist and philosophical research that has been carried out in this study has been deemed to be effective in terms of managing appropriate resources. In addition to managing sound findings, it gives the sources that are necessary for suitable techniques to be explored. It is possible to handle solid discoveries and develop a terrible technique by conducting good research, which will generate considerable growth. Furthermore, this report incorporates a quantitative approach that assists in concentrating on the entirety of the research in an efficient manner, hence facilitating the collection and analysis of data in an unsuitable manner.

4.2.Sample and Data

When it comes to managing resources in a manner that is more applicable, some of the useful strategies that are effective include sampling and statistical analysis. It is the instrument that is utilised to manage and indicate for the purpose of collecting so that resources may be obtained in an efficient manner. To really oversee and examine the development and populace of a subset and get a powerful populace, this strategy is of extraordinary viability. A questionnaire and survey were the methods

ISBN - 978-93-95060-79-0

that the researcher chose to use for this investigation. It is the responsibility of the population manager to consider the available resources, as well as to create sample data and sets that contain and manage a portion of the population. The management practises made use of the questionnaire in their operations. In the current investigation, the researcher selects fifty individuals who are now employed by Virtuoso as respondents.

4.3.Measure

To quantify the elements that contribute to occupational stress and oversee the data collection across various industries. Sampling measurement would be taken into consideration with the aid of resource management and in an efficient manner. It is necessary to take into account the Likert scale approach as a sample strategy. Through a frequency distribution channel, the value of these approaches and their interpretation can be carried out in order to fulfil the substantial need.

5. DATA ANALYSIS AND INTERPRETATION

Table 1: Growth effect.

Does marketing have a direct impact on the company's growth and sales performance?	**Frequency**
a) Strongly agree	15
b) Agree	10
c) Strongly disagree	12
d) Disagree	13

ISBN - 978-93-95060-79-0

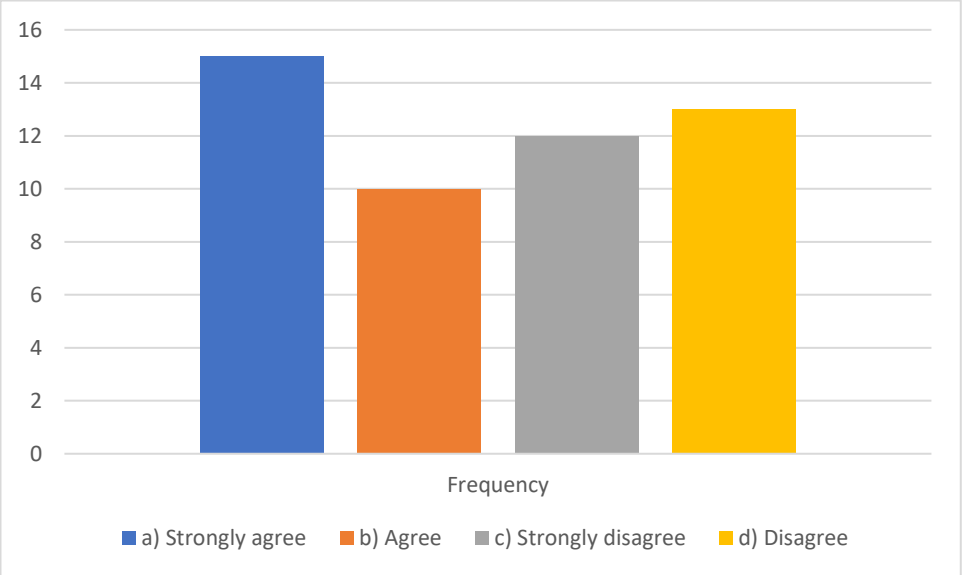

Figure 1: Growth effect.

Interpretation: The survey results about the direct effect of marketing on the company's growth and sales performance are shown in the table. Remarkably, a sizable majority of participants voiced agreement, with 10 and 15 respondents agreeing and strongly agreeing that marketing directly affects sales success and company growth. On the other hand, there is a significant minority opinion, with 12 respondents strongly disagreeing and 13 disagreeing that marketing directly influences a company's sales results. The distribution of responses points to a range of viewpoints within the sample, highlighting the need for additional research or analysis to identify the underlying causes of differing perspectives on the connection between marketing initiatives and the sales performance of the organisation.

Table 2: Perceived Impact of Planning Business Operations on Sales Performance

Is one of the main advantages of business planning for the company's success in sales performance?	**Frequency**
a) Strongly agree	14
b) Agree	11
c) Strongly disagree	10
d) Disagree	15

ISBN - 978-93-95060-79-0

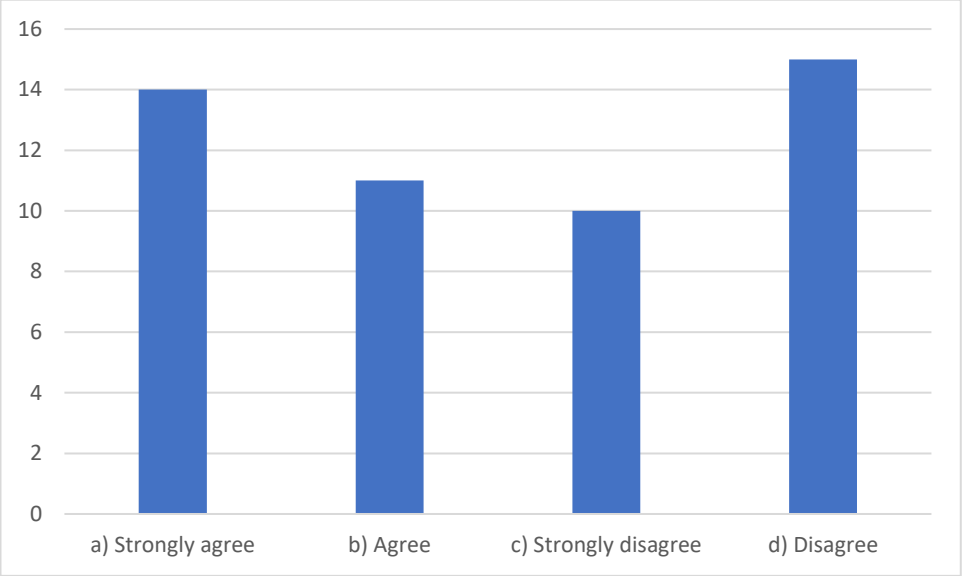

Figure 2: Perceived Impact of Planning Business Operations on Sales Performance.

Interpretation: The responses of persons about how well-planned business operations affect a company's ability to do well in sales are displayed in the table. Remarkably, 14 participants firmly concur that a key element influencing sales success in a business is the preparation of business operations. Eleven respondents also indicate that they mostly agree with this idea. On the other hand, 15 participants disagree and 10 participants strongly disagree that company operations planning is essential to obtaining success in sales performance. These answers reveal a range of viewpoints within the sample population; while a sizable fraction acknowledges the value of planning, a noteworthy proportion is either doubtful or has other ideas about the relationship between successful sales and strategic business planning. Understanding the underlying viewpoints and circumstances driving these differing attitudes may require more investigation and study.

Table 3: Perceived Relationship Between Marketing Initiatives and Employees' Sales Performance.

Marketing's effect on employees' sales performance is correlated with the types of chances that have been generated to stand out in the market.	**Frequency**
a) Strongly agree	13
b) Agree	12

ISBN - 978-93-95060-79-0

c) Strongly disagree	11
d) Disagree	14

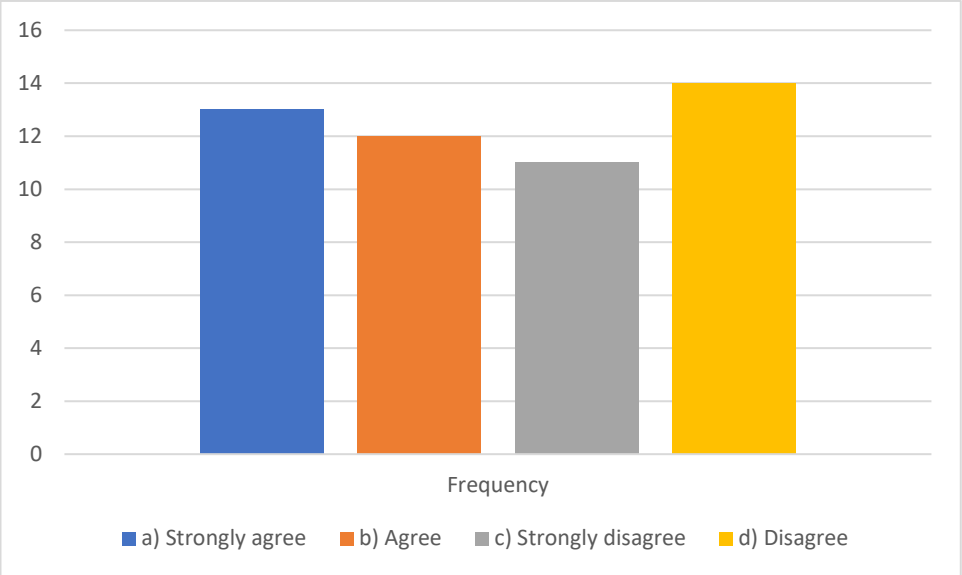

Figure 3: Perceived Relationship Between Marketing Initiatives and Employees' Sales Performance.

Interpretation: The survey results about the effect of marketing on employees' sales performance are displayed in the table labelled "Perceived Relationship Between Marketing Initiatives and Employees' Sales Performance". The above mentioned statement was presented to the respondents, and they were asked to rate their agreement or disagreement. Based on the frequency distribution, the statement is agreed upon by 13 respondents strongly, disagreed upon by 12, severely disagreed upon by 11, and disagreed upon by 14. The findings indicate that employees' perceptions of the relationship between marketing initiatives and the development of market opportunities to improve sales performance are not all that similar. This data offers insightful information on the many viewpoints found in the workforce and can direct strategic choices meant to match marketing campaigns with staff members' expectations and perceptions for the best possible sales results.

Table 4: Perception of Marketing Tactics in Identifying Company Buying Behavior.

ISBN - 978-93-95060-79-0

Examine the claim that marketing strategies might reveal a company's purchasing patterns.	**Frequency**
a) Strongly agree	11
b) Agree	14
c) Strongly disagree	12
d) Disagree	13

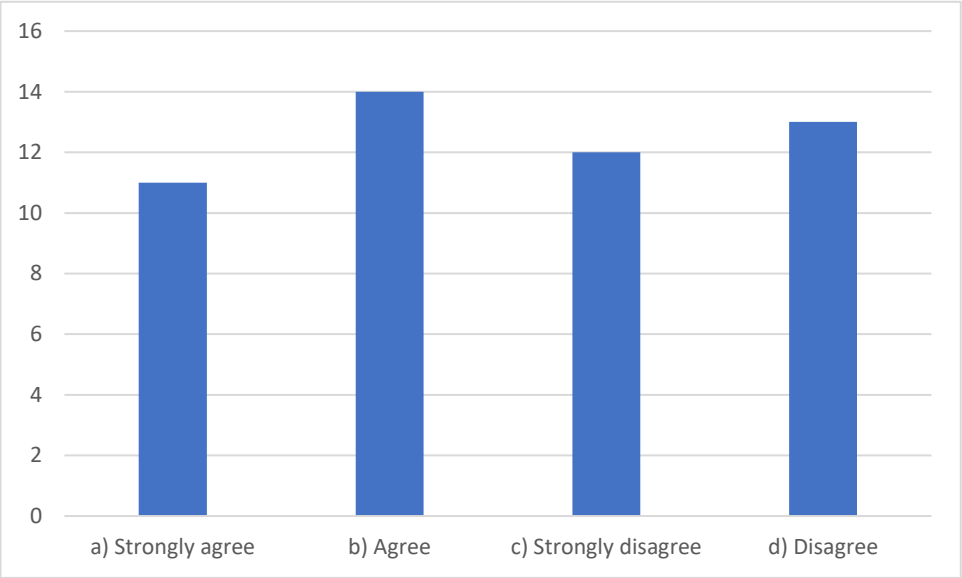

Figure 4: Perception of Marketing Tactics in Identifying Company Buying Behavior.

Interpretation: Eleven respondents highly agreed, fourteen agreed, twelve strongly disagreed, and thirteen disagreed, according to the frequency distribution of responses displayed in the table. The findings show that participants' opinions on how well marketing strategies work to predict the company's purchasing patterns are not all the same. Although a significant proportion of respondents agree with the statement, a notable portion disagree or strongly disagree, indicating differences in perceptions regarding the efficacy of marketing techniques in comprehending and impacting purchasing habits within the firm. The identification of the fundamental causes influencing these divergent points of view and the formulation of strategic decisions on marketing campaigns may require additional investigation and qualitative insights.

ISBN - 978-93-95060-79-0

Table 5: Social Media Account Management as a Key Sales Strategy: Stakeholder Perception.

One of Virtuoso's greatest approaches for creating its sales techniques will be to manage the company account on social networking sites.	**Frequency**
a) Strongly agree	10
b) Agree	12
c) Strongly disagree	16
d) Disagree	12

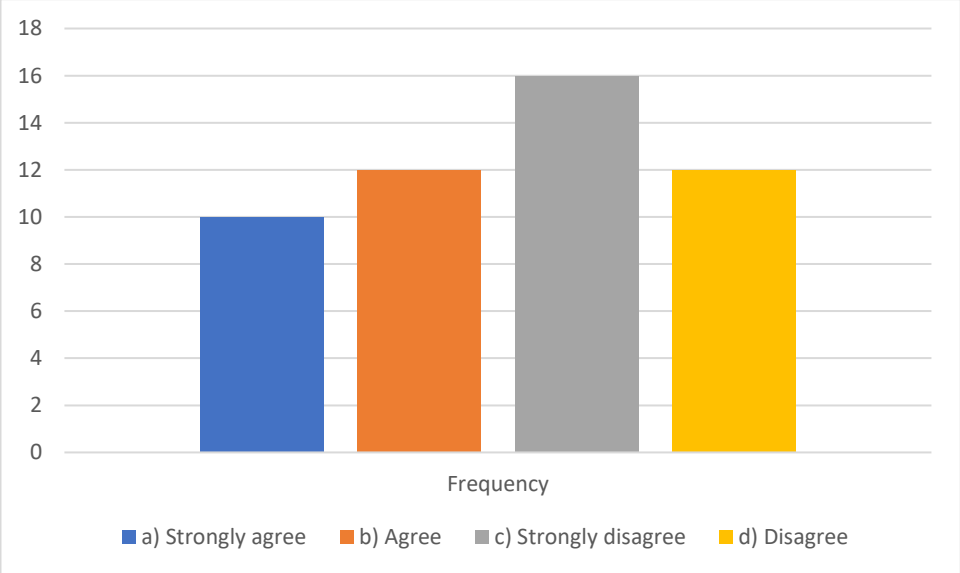

Figure 5: Social Media Account Management as a Key Sales Strategy: Stakeholder Perception.

Interpretation: The table offers valuable insights into stakeholders' perceptions regarding the effectiveness of Virtuoso's sales strategy, which involves managing the business account through social media channels. With a total of 22 responses (10 strongly agreeing and 12 agreeing), the majority of respondents have a positive opinion of this method. However, a sizeable portion—28 in all—hold a negative opinion (16 strongly disapproving and 12 disagreeing). The comments' distribution indicates a divergence of opinions about how well Virtuoso's business account management using social media may improve sales tactics. To better match with stakeholder expectations and preferences, the existing strategy may need to

ISBN - 978-93-95060-79-0

be refined or adjusted. This can be achieved by additional study and investigation of the factors that led to these divergent viewpoints.

6. RECOMMENDATIONS AND CONCLUSION

Relationship management's function is to oversee marketing strategy and achieve company performance, both of which have been carefully evaluated and recorded for analysis in research management and discussion. Setting up successful marketing strategies is becoming more and more crucial for businesses, as they will be linked to both growth and good performance in the marketplace. Maintaining financial records, selling the company's products and services to clients, and managing financial performance are all necessary. By utilizing the legitimate item life cycle, this exploration likewise helps with effectively directing the business, client, and management impacts to accomplish homogeneity and serious methodologies. This strengthens the bond and improves the company's performance in a more useful and efficient manner. According to this study, the resource-based approach of the business relates to handling pricing, promotions, and products in order to be regarded as relevant and successful problems. The comprehensive results and analysis can be utilised by several sources to oversee the company's expansion into more relevant data sources. High findings from earlier research—conducted by a variety of writers—that manage the performance of the company and foster market expansion are included in this report.

Recommendations:

- **Diversify Marketing Tactics for Enhanced Sales Success:** Recommend exploring a broader range of marketing tactics to identify those that contribute significantly to variations in sales success.
- **Conduct In-Depth Customer Reaction Studies:** Suggest conducting detailed studies on customer reactions to different marketing channels.
- **Explore Revenue Growth and Market Penetration Opportunities:** Recommend delving deeper into the assessment of how different marketing initiatives contribute to revenue growth and market penetration.

ISBN - 978-93-95060-79-0

- **Enhance Brand Awareness and Perception Studies:** Encourage a more extensive investigation into the influence of brand awareness and perception on customer purchasing decisions and sales outcomes.
- **Integrate Comprehensive Digital Marketing Assessment:** Recommend a comprehensive examination of digital marketing initiatives and their impact on both online and offline sales success.

Abstract

Work plan and the mental, emotional, and relational social dynamics that influence an association's adequacy are totally remembered for organizational way of behaving. The discipline of the board, which concentrates on the most proficient method to manage people to complete specific obligations, is fundamental for grasping organizational way of behaving and business productivity. For corporate viability, the board puts serious areas of strength for an on the preparation, execution, and configuration of different organizational and regulatory frameworks. The association, then again, adjusts or restructures the people and gatherings through its structure, culture, arrangements, legislative issues, power, and systems, as well as the jobs expected individuals in it. People and gatherings bring their abilities, information, values, thought processes, and mentalities into the association and consequently impact it. How associations are structured and run has definitely changed over the most recent couple of many years. A modern workplace with interdependent skills and workflows has been made possible by technological advancements and skill variety. Therefore, it is essential for organisations to comprehend the factors influencing team results if they are to succeed in the modern business environment. According to this study, which involved 120 managers from the same company, female managers are more susceptible to groupthink and have better communication skills than their male counterparts. This organization's 150 employees were all examined, and the findings indicate that female employees outperform male employees in

ISBN - 978-93-95060-79-0

terms of their contribution to team outcomes. Consideration is given to the implications for managers, researchers, and human resource specialists.

Keywords: *Co-Operative Behaviours, Organizational Dynamics, Leadership Behaviours, Emotional Intelligence, Personality Characteristics, Organizational Structure, Organizational Culture.*

1. INTRODUCTION

Teams are crucial to all that people do in their everyday lives in the current world. Many people initially came into contact with the concept of teams when they were young athletes participating in different sports. The well-established maxim "There is no 'I' in group" is acquainted with youthful competitors when they play a situation in a group, whether it be on the baseball field or the soccer throw. One can determine that the letter "I" does not occur in this word by quickly examining the four letters that make up this word.

If you take this adage literally, there are a tonne of different ways you might interpret it. For example, coaches frequently impart to their players the idea that each member of the team has a designated role to play and that each task is equally important to the team's success as a whole. From this perspective, teamwork is viewed as the story of individuals with disparate skill sets working together to achieve a common goal. Applying this plan to the contemporary business climate, we might see that, in response to emanant staggered frameworks, there has been a quick organizational shift from a collection of individual situations to work gatherings and groups.

Innovation has progressed rapidly throughout recent years, and associations all around the world have been compelled to rearrange their work around groups to answer all the more rapidly, adaptably, and deftly to unexpected conditions. The adjustment of work association is being advanced by a few elements. Diverse skill sets, quick thinking, and effective adaptability are under constant demand in an emotionally and mentally exhausting workplace marked by intense competition, ongoing change, best practises and technological advancements, and impending uncertainty. The best strategy for addressing the organisational problems of the twenty-first century is teamwork.

ISBN - 978-93-95060-79-0

An association is a unique social structure that is impacted by both outer and interior factors. To build its adequacy, an association relies upon major perspectives on errands, individuals, innovation, and structure. The investigation of individual and gathering ways of behaving inside associations and the use of this data to further develop corporate adequacy is known as organizational way of behaving. It is firmly connected with and for the most part centered around the comprehension, anticipating, and the board of human conduct in associations. It additionally furnishes the board with the standards of conduct that are expected in associations.

Collective vibes and the essentials of frameworks believing are underlined in organizational way of behaving. It reinforces a coordinated and coherent way to deal with the executives execution and is keen on the impact that discernment and inspiration play in a singular's way of behaving. To more readily get it, change, and upgrade individual and gathering ways of behaving, this precise investigation of the nature and culture of associations takes a gander at relational and leadership ways of behaving corresponding to groups, social variety, and morals in associations. It additionally advances human conduct to increment corporate viability.

A proportion of an association's presentation, development, efficiency, and productivity is called corporate viability. At the point when a company can accomplish its targets as to the triple main concern, it is considered viable. Since human way of behaving is vital for both execution and corporate adequacy, organizational way of behaving is particularly keen on the unmistakable way of behaving that every person inside an association shows.

Consequently, organizational conduct looks to comprehend the reason why one individual might answer well to a situation while another answers ominously. It also examines why, while receiving the same management, two or more distinct people working on the same task come up with radically different outcomes. To this extent, organisational behaviour is not limited to improving an organization's effectiveness; rather, it is a field that aims to improve understanding of behaviour in organisational settings by studying individuals, groups, organisations, politics, and power from an academic perspective. The ultimate goal of this knowledge is to

ISBN - 978-93-95060-79-0

improve both organisational effectiveness and individual well-being.

The focus of the psychology movement today is much more on developing people's skills rather than trying to figure out what is wrong with them and how to correct it, which leads to more productive and satisfying lives for individuals. This led to the early adoption of positive psychology by prominent psychologists with a focus on research, like Diener, Synder, Csiksentmihalyi, Csiligman, and Peterson. The goal of positive psychology (PP) is to maximise each person's unique talents. good psychology, according to Seligman, is the study of good emotions and the assets that make people and society flourish.

The well-being of employees is a factor in the rising need for enhanced work performance. This makes it necessary to create models and frameworks for managing workers' capacities in order to improve work performance. The goal of using positively oriented models to develop people's abilities is to strengthen the organisation. According to Luthans, the general perspective in organisational behaviour (OB) has historically been more negative than positive. For instance, there has been a greater emphasis on dysfunctions, stress, and burnout than on eustress; managers' shortcomings and obstacles are highlighted rather than their strength and capacity for growth and performance improvement. "Behaviour, attitudes, and performance of people in organisations" are the subjects of OB research.

This area of study focuses on how workers' efforts either increase or decrease an organization's overall productivity and project success. Positive organisational behaviour (POB) is the integration of PP into the study of organisational behaviour with the goal of enhancing employee well-being and driving organisations towards higher performance. According to McHugh, implementing POB lowers the likelihood of losing talented individuals by increasing employee commitment at work.

Similar to this, a lot of study has been done on stress management, but much of it concentrates on negativity. Prior research on stress management has outlined coping mechanisms, stressors and stress-affecting elements, and occupational stress management for construction industry professionals. Numerous written works demonstrate the psychological basis of work-related stress. Instead of attempting

ISBN - 978-93-95060-79-0

to recapture them, the present paper will evaluate the impact of the psychological qualities that were used as POB models in this study on positive stress in the workplace.

In spite of the fact that pressure is an undeniable piece of life, late improvements in the field of pressure the board research have upheld an accentuation on the positive. Positive pressure is alluded to as eustress, though regrettable pressure is alluded to as pain. The beneficial side of stress, or eustress, is the subject of this investigation. It is crucial to remember that the emphasis on optimism stems from a recent change in stress reduction techniques. The question is, because optimism can encourage a better work-life balance and the wellbeing of people, why do we focus on negativity so much? "Positive response to stretch that produces inside us a craving to accomplish and overcome a test" is the manner by which Jones depicts eustress.

Employees experience favourable emotions as a result, which boosts output and fosters an overall sense of satisfaction and well-being. A person's cognitive and behavioural efforts about work-related stress have an impact on their capacity to manage it. Work performance is impacted by poorly managed stressful work environments because they have an impact on the interpersonal and organisational interactions among project team members. The purpose of the study is to evaluate how POB models affect occupational stress in Maharashtra's construction workforce.

The implementation of POB models is still in its early stages, but research suggests that good employee reactions will raise the degree of eustress.

2. OBJECTIVES

- To investigate the methods of decision-making and leadership that managers use in various organisations.
- To look at the elements that affect worker behaviour, such as engagement at work, motivation, and job satisfaction.
- To investigate how team dynamics, communication styles, and cooperation tactics affect the efficacy of organisations.
- To evaluate how organisational culture influences managers', workers', and teams' conduct.
- To recognise the potential and difficulties related to inclusion and

ISBN - 978-93-95060-79-0

diversity in organisational structures, as well as how they affect behaviour.

3. LITERATURE REVIEW

Macky, K. (2019), examines how automation, robotics, and artificial intelligence (AI) may affect the nature of labour in the future. She talks on the possibility of pay stagnation and job displacement in some industries, especially those that rely a lot on regular work. She does, however, also draw attention to possible prospects for the creation of new jobs in fields requiring social intelligence, creativity, and critical thinking. In order to handle the shift to a future of work that is driven by technology, Mackey highlights the necessity of proactive governmental changes, educational reforms, and the development of individual skill sets.

Mathieu, J. E., Tannenbaum, S. I., & Salas, E. (2019), emphasises creating and leading successful teams in work environments. It offers a thorough rundown of all the important elements that go into making a successful team, such as the makeup of the team, the leadership style, communication styles, methods for resolving conflicts, and efficient team procedures. In addition to highlighting the value of evidence-based procedures, Mathieu et al. offer leaders and team members useful advice on how to collaborate and accomplish goals.

Schaufeli, W. B., & Leiter, M. P. (2018), explores the ideas of burnout and job engagement, emphasising how they are related and how they affect people's quality of life and the effectiveness of organisations. High degrees of vigour, dedication, and absorption are characteristics of a positive, fulfilling work state, according to their definition of work engagement. On the other hand, cynicism, diminished efficacy, and emotional tiredness are signs of burnout. The analysis reveals elements like job resources, encouraging leadership, and a favourable work environment that boost engagement and avert burnout. In light of evolving work contexts, it calls for more research on work engagement and burnout in its conclusion.

Shamir, B., Howell, J. M., & Avolio, B. J. (2019), presents the idea of collaborative leadership, which places an emphasis on leadership responsibilities being shared within a team or organisation. This strategy encourages cooperation, decentralised decision-making, and group ownership of

ISBN - 978-93-95060-79-0

results. The authors contend that in complex and dynamic contexts where no single person possesses all the essential information and skills, collective leadership can be more effective than traditional individual leadership techniques. They talk about many kinds of collective leadership and investigate the environments that support it, like mutual respect, trust, and common objectives.

Grant, A. M., & Hofmann, D. A. (2019), introduce the idea of "job crafting," which describes the proactive actions people take to adjust their work responsibilities, relationships, and cognitive demands so they better suit their particular needs and preferences. They contend that there are several advantages to job creating, such as improved performance, engagement, and well-being. The writers examine the empirical data that backs up these assertions and go over several tactics for promoting and assisting job crafting in businesses.

Gratton, L., & Scott, A. (2019), Examine the effects of a rapidly ageing population—where longer lifespans are becoming more typical—on society and the person. They contend that conventional ideas of retirement are fading and put out a "100-year life" paradigm in which people work in various stages of their lives, alternating between times of education, travel, and recreation. The writers talk on the benefits and problems that this poses for people and businesses, highlighting the need for flexible work schedules, chances for ongoing education, and innovative methods for managing jobs over an extended lifetime.

4. RESEARCH METHODOLOGY

A total of 150 workers and 120 managers from the same Maharashtra, India-based organisation took part in different team-related surveys. This tactic makes it possible to conduct a more thorough investigation that highlights the viewpoints of the team and the leadership. Every participant in the survey provided answers to questions about their demographic information. Tables 1 and 2 show the demographic breakdown for managers and employees, respectively.

ISBN - 978-93-95060-79-0

Table 1: Demographic of Managers.

Gender	Management Respondents	Age Group 30 and above	Five years of team management experience	Bachelor's Degree
Male	65	47	49	42
Female	55	51	47	44
Total	120	98	96	86

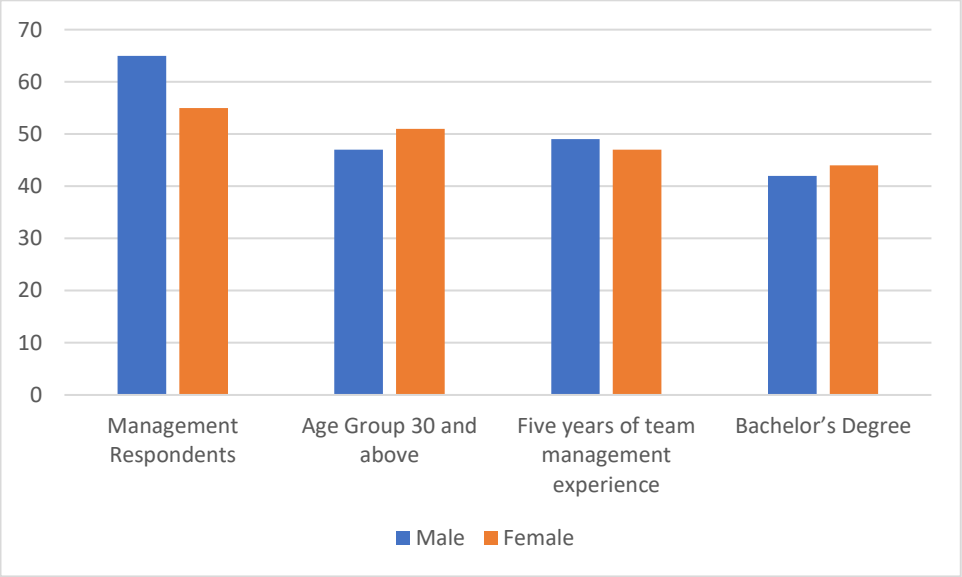

Figure 1: Demographic of Managers.

The poll respondents are broken down into age groups (30 and above), gender, management roles, five or more years of experience managing a team, and bachelor's degree holders in the table. There are 120 responders in all, 65 of them are men and 55 are women. There are 51 females and 47 males in the age range of 30 and over. Similarly, 49 men and 47 women meet the criteria for having five or more years of experience managing a team. Regarding educational background, 42 men and 44 women possess a bachelor's degree. The distribution of management responses is shown in depth in the table, which also sheds light on how gender, age, experience, and education connect with one another in the sample.

ISBN - 978-93-95060-79-0

Table 2: Demographic of Employees.

Gender	Employee Respondents	Age Group 30 and above	Five years of team work experience	Bachelor's Degree
Male	70	76	64	69
Female	80	63	55	58
Total	150	139	119	127

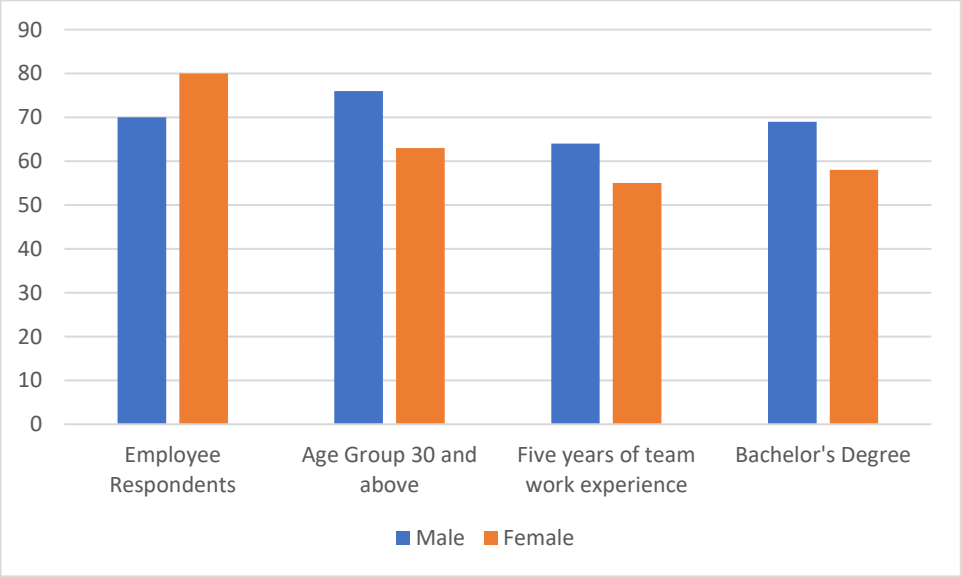

Figure 2: Demographic of Employees.

The demographic composition of the employee respondents is shown in the table according to their gender, age (30 and older), number of years of teamwork experience, and level of education (Bachelor's Degree). According to the data, a total of 80 female and 70 male respondents were included. There were 76 men and 63 women among the workers who were 30 years of age or older. Similarly, there were 64 men and 55 women in the group of workers with five years of experience working in a team. In terms of education, 58 women and 69 men have bachelor's degrees. Overall, the table provides a thorough overview of the distribution of employee characteristics, including information on the surveyed population's age demographics, gender representation, teamwork experience, and educational background.

ISBN - 978-93-95060-79-0

The provided parameter is 5-point Likert scale key, where each point on the scale is associated with a specific qualitative descriptor. The scale is designed to gauge the frequency or intensity of a particular behavior or response. A rating of 1 corresponds to "Never," indicating that the behavior or response in question is not observed or experienced at all. A rating of 2 is associated with "Rarely," suggesting that the behavior occurs infrequently or in a limited manner. Moving along the scale, a rating of 3 corresponds to "Sometimes," indicating a moderate occurrence or frequency. As the scale progresses, a rating of 4 is linked to "Often," suggesting a higher frequency or intensity of the behavior or response. Finally, a rating of 5 aligns with "Always," indicating that the behavior or response is consistently present or occurs with a high level of regularity.

The answers' aggregates were used to work out the different scores related with the review's speculations, which incorporate:

Hypothesis 1: When it comes to how much they value worker communication; female managers will score better.

Hypothesis 2: Female managers will score better when it comes to succumbing to groupthink.

Hypothesis 3: More female employees than male employees will add to the team's success.

5. DATA ANALYSIS AND INTERPRETATION

According to Table 4, This research supported the primary hypothesis, which stated that "Female directors will have higher scores on communicating with representatives." With a p-worth of 0.002, the scores of the female supervisors were significantly higher than the male bosses'.

Table 4: Managers that are female will score higher when it comes to staff communication. The T-test of two means and descriptive statistics.

Gender	Mean	Standard Deviation	Sample Size
Male	31.89	6.13	60
Female	40.02	7.01	60

t = 7.123; p = 0.002

ISBN - 978-93-95060-79-0

Interpretation: The data summary in the table compares two groups—male and female—in relation to a certain variable. The average value of this variable for each gender is displayed in the "Mean" column, which indicates that the mean for men is 31.89 and the mean for women is 40.02. The degree of variability or dispersion around the mean is shown in the "Standard Deviation" column, where the standard deviation for males and females is 6.13 and 7.01, respectively. Greater variety in the data points is suggested by a higher standard deviation. Lastly, the "Sample Size" column reveals that each of the two groups has sixty members. The data indicates that there is a discernible difference in the mean values between the sexes, suggesting that the characteristic under discussion tends to be greater in the female population on average. Furthermore, it appears from the standard deviation figures that the data for females compared to males is more variable. Maintaining a constant sample size guarantees an equitable comparison of the two groups. To ascertain the significance of the observed differences and to draw conclusions about the population from which these samples were taken, additional statistical analysis, such as a t-test, might be performed.

According to Table 5, The results of this study supported the second hypothesis, which stated that "Female directors will have higher scores on becoming impacted by mindless obedience." With a p-worth of 0.002, the results demonstrated that the female supervisors' scores were significantly higher than the male leaders.

Table 5: Managers that are female will score higher when it comes to succumbing to groupthink. The T-test of two means and descriptive statistics.

Gender	Mean	Standard Deviation	Sample Size
Male	26.09	4.11	60
Female	37.01	7.69	60

t = 9.494; p = 0.002

Interpretation: For the two different gender groups—male and female—the table offers a succinct overview of the important descriptive information. Regarding the variable in question, the average value for the male group is 26.09, indicating that male participants generally show lower values in this category. On average, female participants have higher values in the variable of interest, as indicated by the significantly higher mean of 37.01 for the

ISBN - 978-93-95060-79-0

female group. The male standard deviation (4.11) and the female standard deviation (7.69) offer valuable information on the variability or dispersion of individual data points within each group. While a higher standard deviation for females indicates greater variety in the data points around the female group mean, a smaller standard deviation for males indicates values within the group are generally near to the group mean. The statistical credibility of the data is enhanced by the uniform sample size of 60 for both genders. All things considered, this table provides important insights into the distribution of the variable under study by assisting in the comprehension of the central tendency, variability, and sample size features among the male and female groups.

According to Table 6, the third hypothesis, which was supported by this study, "Female representatives will contribute to group outcomes more than male workers." The scores of the female chiefs were p-valued at 0.002, significantly higher than the male directors' scores.

Table 6: The team's success will be enhanced by having more female employees than male personnel. Descriptive statistics and the T-test between two means.

Gender	Mean	Standard Deviation	Sample Size
Male	32.49	7.01	75
Female	40.58	6.02	75

t = 11.521; p = 0.002

Interpretation: Sorted by gender, the table offers an overview of information about a particular variable. For both the male and female groups, the mean, standard deviation, and sample size are provided. The mean, which stands for the average value of the variable within each gender category, is 40.58 for women and 32.49 for men. Males have a standard deviation of 7.01 and females a standard deviation of 6.02, which shows how values are disseminated around the mean. Greater data variability is indicated by a higher standard deviation. Consistently, the sample size for both genders is 75, indicating a comparable and balanced distribution of data points. Overall, the data shows that the average values of the male and female groups differ, with the females showing a little lower variability and a higher mean than the males. Standardised sample sizes improve the results' dependability and lay the groundwork for additional statistical analysis and interpretation of the relevant variable.

ISBN - 978-93-95060-79-0

6. RECOMMENDATIONS AND CONCLUSION

According to theory, it is essential to comprehend how and why an individual's ability to collaborate with others affects their success in the workplace. Since collaboration is a stand-in for cohesiveness and synergy, managers must therefore have a practical grasp of whether or not it affects performance. The study's conclusions, which are presented in this article, indicate that collaboration significantly affects people's careers and relationships at work. This makes this an issue that merits further scholarly research. This review indicates that female managers place a greater emphasis on team communication than do their male counterparts. Organisations that place a high importance on responsibility, transparency, and communication tend to do better during periods of organisational transition. Organisations ought to feel comfortable enrolling and lifting ladies to management jobs on the off chance that this study's discoveries demonstrate that female managers have a prevalent comprehension of the worth of communication than their male colleagues. Regardless of the way that the two genders can raise their emotional intelligence, this study has uncovered that ladies are more emotionally astute than men, which might make them more powerful managers in the twenty-first 100 years. Many people believe that women possess natural leadership qualities that can increase their viability, comprehension, and receptivity. For instance, some people think that women are more skilful, creative, sympathetic, and coordinated than men. Females are natural leaders because they know how important it is to establish a connection when speaking.

Recommendations:

- **Diversify Data Collection Methods:** Suggestion: Supplement survey data with qualitative methods such as interviews or focus group discussions.
- **Longitudinal Study for Dynamic Analysis:** Suggestion: Consider extending the research scope over a more extended period, implementing a longitudinal study.
- **Cross-Industry Comparative Analysis:** Suggestion: Expand the research horizon by comparing findings with organizations in different industries within Maharashtra, India.

ISBN - 978-93-95060-79-0

- **Utilize Employee Feedback Sessions:** Suggestion: Organize feedback sessions with employees to gather qualitative insights on their experiences with organizational culture, inclusion, and diversity.
- **Implement Training and Intervention Programs:** Suggestion: Propose the implementation of training programs based on the research findings to address identified challenges in teamwork, communication, and leadership.

Abstract

The reason for these blended strategies study was to examine the association between the inspiration of workers and the authority style utilized at a confidential petrochemical organization in Maharashtra, India. A questionnaire was created and sent to fifty workers across two divisions. In addition, five employees were interviewed as part of a focus group to confirm the survey's findings. According to the study, there is a significant association between a leader's transformational style and staff motivation; the correlation is negative for a transactional approach. This study aims to investigate how leadership style affects employee motivation. This study aims to review the evidence regarding how leadership affects employee motivation. The last ten years' pertinent research has been reviewed by the researcher. This study demonstrates that a leader's style has a beneficial effect on workers' motivation. The principles for achieving shared objectives are provided by a leader's style. Effective leaders constantly provide their staff with the right guidance and inspire them to perform their jobs well. Effective leaders motivate their followers to use their abilities and potential to further the objectives of the organisation. A leader's primary responsibility is to inspire and guide subordinates to boost output and revenue. A leader affects the goals and subordinates of the company and plays a vital role in the operation of a corporation. Effective leadership is crucial at all organisational levels. Various organizations utilize different initiative methods of reasoning and ways to deal with motivate. Pioneers might rouse their staff by making

ISBN - 978-93-95060-79-0

structures that upgrade specialist potential, utilize hierarchical assets, and proposition bearing. Nonetheless, they can likewise make it extremely testing to cultivate a culture of cooperation, encourage arrangement, fabricate trust, and prevail upon individuals to the organization's goals.

Keywords: *Democratic Leadership, Autocratic Leadership, Laissez-Faire Leadership, Employee Motivation, Leadership Styles, Performance Improvement, Leadership Behaviour Approach.*

1. INTRODUCTION

It's getting more and harder to find and keep representatives nowadays. The requirement for HR is ascending because of globalization and worldwide powers. All the while, it has been found that representative inspiration goes about as an impetus for both individual execution and the progress of the association. The hardships that organizations presently stand up to are not like those that existed previously. "It is imperative for organisations of all sizes and shapes to exhibit innovative behaviour by seizing opportunities, resolving issues, and adopting novel paths." Both commercial and nonprofit organisations require this kind of ingenuity and inventiveness.

"A broad set of requirements is currently taking shape for organisations, managers, and staff members, and it includes qualities like initiative, adaptability, and creative problem-solving." The ability of modern organisations to maintain their human capital in a cutthroat market is another difficulty. Many businesses find it difficult to provide competitive pay, perks, and incentives. By implementing efficient staff motivation strategies, small businesses can maintain their competitiveness. Managers and leaders are crucial in fostering an environment and culture of productivity and excitement among staff members, which enables them to accomplish their tasks.

"Most of large businesses...keep burning through great many dollars yearly on preparing programs, gatherings to increment inspiration, motivators to brace inspiration, gatherings to analyze issues with representative inspiration, instruments to measure inspiration, statements of purpose, thus forth...." with no recognizable outcomes. It appears that this is due to a lack of knowledge about

what motivation actually entails. "Researchers have approached motivation from a variety of perspectives, despite the fact that motivation is a complex, multifaceted construct whose essence is elusive."

This research looks at the driving forces behind a department's work for a private oil and gas business in Maharashtra, India. employing a self-made questionnaire as a tool to gauge the motivational components. A manager that possesses leadership qualities will inspire their staff to produce better work, and they will foster an environment that values their fresh ideas and opinions. A worker wishes to express thoughts and emotions in order to find fresh approaches to efficiently use available resources. At the point when a supervisor or pioneer reveals data to workers in a straightforward way, supporters and representatives are constrained to have confidence and dedication in the pioneer.

A viable pioneer moves supporters to help result and representative fulfillment. He gave followers a model to follow, modelling his actions. A leader bridges the gap between upper and lower management, or employees. He must convey to lower levels the beliefs and expectations of the top level as well as the challenges and obstacles faced by workers in achieving the top level. He connects all of the higher level and lower level activities. He fostered a sense of camaraderie inside the team by establishing a positive organisational culture. The leader offers direction and counsel to the employees with work-related issues, whether they be emotional or technical.

In order to maximise production and accomplish predefined goals, a competent leader must assign power and offer both financial and non-financial incentives for increasing productivity. A leader can be a friend, a philosopher, and a mentor to those who follow them. The kind of leadership a business chooses to use greatly influences how well it performs in reaching its objectives. It is thought that shrewd leadership combined with an inspired team results in a profitable and enduring corporate enterprise. People are the fundamental force behind organisations because they put their all into them and support them in achieving their goals.

Every business in the world was established with the intention of either generating a profit or providing social

ISBN - 978-93-95060-79-0

services to benefit the community; in certain cases, both goals were pursued at the same time. As a result, all organisations have similar corporate aims. Employers need workers to help them accomplish their goals and objectives, but employees also need their leaders to inspire and motivate them. Since employees are the cornerstone of the company, keeping them engaged and motivated is crucial.

Since effective leadership is necessary to improve a company's performance, a corporation's success or failure is based on how well-led all organisational levels are. The beliefs, actions, and abilities required to influence others to accomplish organisational objectives are known as leadership traits. For this reason, one way to define leadership is as a tactic for getting people to cooperate in order to achieve a common goal. A person's behaviour that aims to influence others' perception of their actions is referred to as their leadership style.

Figure 1: Different Leadership Styles within an Entity.

Leadership within the company has an impact on employee conduct. Effective leaders are the role models who mould the behaviour of their followers and subordinates to achieve the goals and objectives of the company. Organisational leaders have the power to impact employees' values, adaptability to change,

ISBN - 978-93-95060-79-0

and drive. On the other hand, workplace motivation is a difficult problem for any company. An individual's motivation at work is what sustains their inspiration. The mental or mental proficiency that drives the ways of behaving or driving forces communicated for a specific point is the most vital phase in the inspiration cycle.

A continuous psychological process called motivation starts, guides, and sustains behaviour. As evidenced by the execution of the mission, the achievement of predefined goals and objectives, efficiency, sustainability, growth, and competitiveness, data show that an engaged workforce promotes greater organisational and employee performance. Leaders have an effect on employee effectiveness since creating a motivating plan requires considering factors that inspire workers to achieve at their best on an individual and group level.

2. OBJECTIVES

- To find out how staff members view the relationship between leadership and motivation.
- To ascertain if intrinsic or extrinsic motivation is the main source of motivation for employees.
- To investigate the elements that act as motivators for workers in the oil and gas sector.
- To evaluate the effectiveness of current leadership techniques used to inspire workers in the oil and gas industry, pinpoint areas in need of development, and suggest new tactics.

3. LITERATURE REVIEW

Akhtar & Khan (2021), We out a near report in Pakistan that exhibited the effect of a few initiative methods of reasoning on labourer inspiration in people in general and confidential areas. As per their discoveries, staff inspiration is emphatically affected by ground-breaking initiative, which is characterized by romanticized impact, moving inspiration, scholarly excitement, and tweaked thought. This is steady with an abundance of earlier examinations that features the ground-breaking initiative's ability to rouse representatives and further develop commitment and execution.

Bashir & Bhatti (2020), Look at in more detail what balance between serious and fun activities means for the connection between representative inspiration and authority styles. According to their

ISBN - 978-93-95060-79-0

research, the influence of various leadership styles is moderated by work-life balance, with positive work-life balance amplifying the motivational impact of leadership—particularly that of transformational and transactional types. This research emphasises how crucial it is for managers to support their staff members' work-life balance in order to maximise motivational results.

Chen & Wang (2023), explore in more detail the precise effect that moral leadership has on worker motivation. Through a moderated mediation model including psychological safety and job autonomy, their research reveals that ethical leadership—characterized by honesty, fairness, and concern for the well-being of employees—positively promotes employee motivation. The aforementioned paradigm places significant emphasis on the provision of a secure work environment that fosters employee autonomy and self-expression, hence augmenting their motivation levels.

Gorgieva & Gorgiev (2021), Examine the wider effects of leadership philosophies on worker motivation and organisational dedication. According to their research, certain leadership philosophies—such as democratic, transactional, and transformational—have a favourable impact on employees' commitment and drive. This all-encompassing strategy emphasises the complex influences of leadership, highlighting its ability to influence not just employee engagement and motivation, but also their allegiance to the company.

Gupta & Singh (2023), analyzed what authoritative culture means for the connection between worker inspiration and initiative style. They found that the connection between representative inspiration and administration style may be directed by hierarchical culture. Specifically, that's what they found, albeit a controlling hierarchical culture can will more often than not relieve the positive connection between groundbreaking initiative and worker inspiration, a steady hierarchical culture can really increment it.

Kim & Park (2022), examined the relationship between job satisfaction and employee motivation as influenced by leadership styles, with a focus on the mediating role of psychological empowerment. They discovered that work happiness and staff motivation can be greatly impacted by leadership

ISBN - 978-93-95060-79-0

philosophies. In particular, they discovered that whilst transactional leadership had an adverse effect on worker motivation and job satisfaction, transformational leadership had a favourable effect on both. Additionally, they discovered that the association between leadership styles and worker motivation and job satisfaction was mediated by psychological empowerment.

4. RESEARCH METHODOLOGY

The primary goal of research is information gathering. Information can be gathered spontaneously or by following a strict process. Any examination task ought to utilize an OK procedure to address the exploration issue or questions. Information for this study were accumulated utilizing a blended techniques methodology that utilized quantitative and subjective procedures. A speculation is tried, the size of the peculiarities of interest is estimated, and the outcomes are then summed up utilizing a quantitative methodology.

At the point when you wish to fathom the peculiarity and consider individual feelings, you utilize a subjective technique. Gaining a deeper knowledge of the unique environment of an oil and gas sector setting would be aided by such qualitative study. Selecting a mixed methods approach will, above all, help to overcome the limitations of a single technique and aid to assure the dependability of the results, as well as make them easily accepted by readers. Using several approaches in one study increases the study's legitimacy and solidifies its findings.

A questionnaire was created to gauge employees' opinions in order to research how they view the influence of leadership. From the essential things, a five-point Likert scale with the choices emphatically deviate, concur, impartial, and differ was utilized. An email with a connection to the poll was dispersed to the organization's staff to accumulate information. Following receipt, the answers were joined into one sheet and exposed to both spellbinding and inferential measurable examination. Individuals who addressed this overview were picked aimlessly. Since the arbitrary example approach gives each individual from the objective populace an equivalent opportunity to partake in the review, the discoveries are more reliable.

ISBN - 978-93-95060-79-0

5. DATA ANALYSIS AND INTERPRETATION

The survey data was collated, input into SPSS, and the findings were examined appropriately. Relevant statistical data, both descriptive and inferential, has been extracted. Thematic analysis and coding were used to examine the qualitative data—the results obtained from the interviews.

5.1.Descriptive Analysis

a. Age of participants

Table 1: Age of participants.

	N	Minimum	Maximum	Mean	Std. Deviation
Age	50	19	51	30.01	6.411
Valid N	50				

The participants' ages range is 30, with 30 being the average age.

b. Positions of participants (managerial or non-managerial)

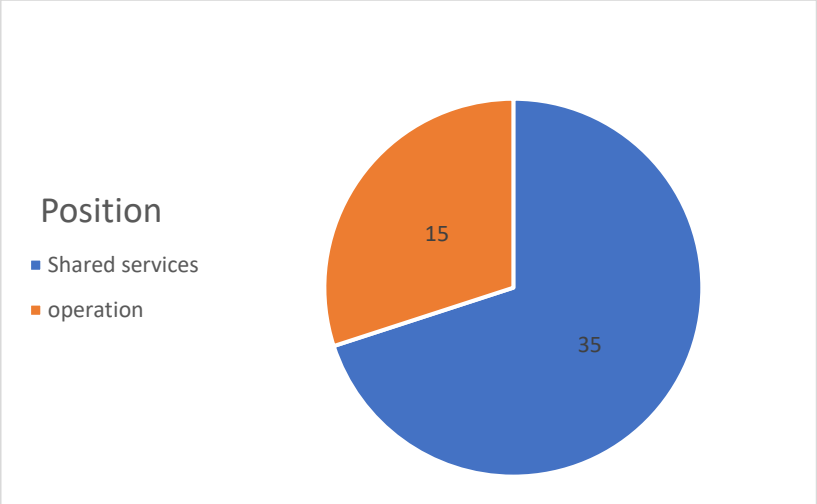

Figure 2: Positions of participants.

Thirteen of the participants hold managerial positions, compared to 37 non-managerial positions.

c. Departments of participants

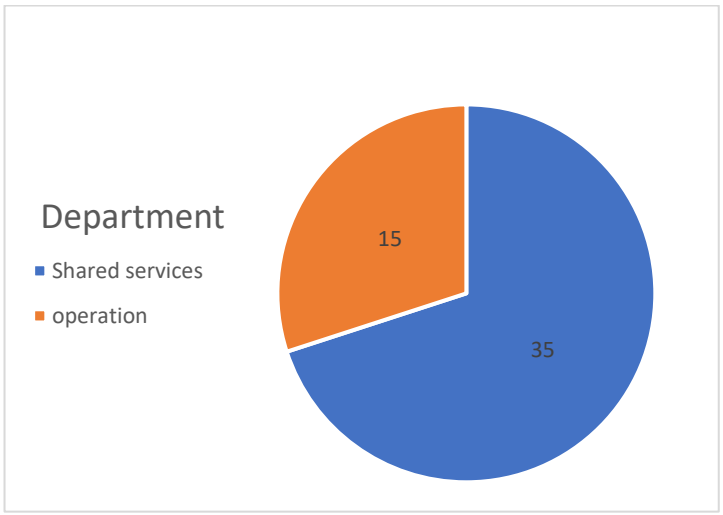

Figure 3: Departments of participants.

Fifteen of the total participants are in operation, and 35 are in the shared services section.

d. Participants' Education level

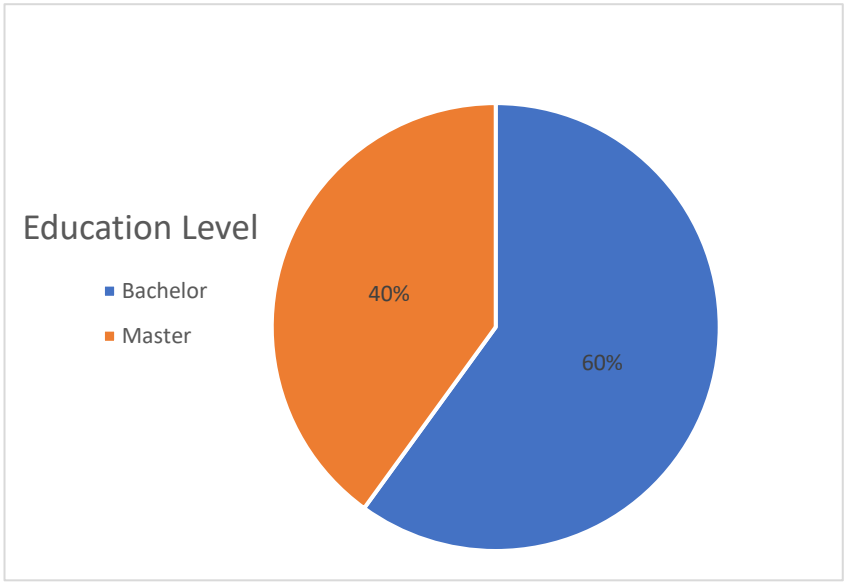

Figure 4: Educational Level of Participants.

Two fifth of participants has a bachelor's degree, while the other three fifth have a master's degree.

e. Participants' years of experience

ISBN - 978-93-95060-79-0

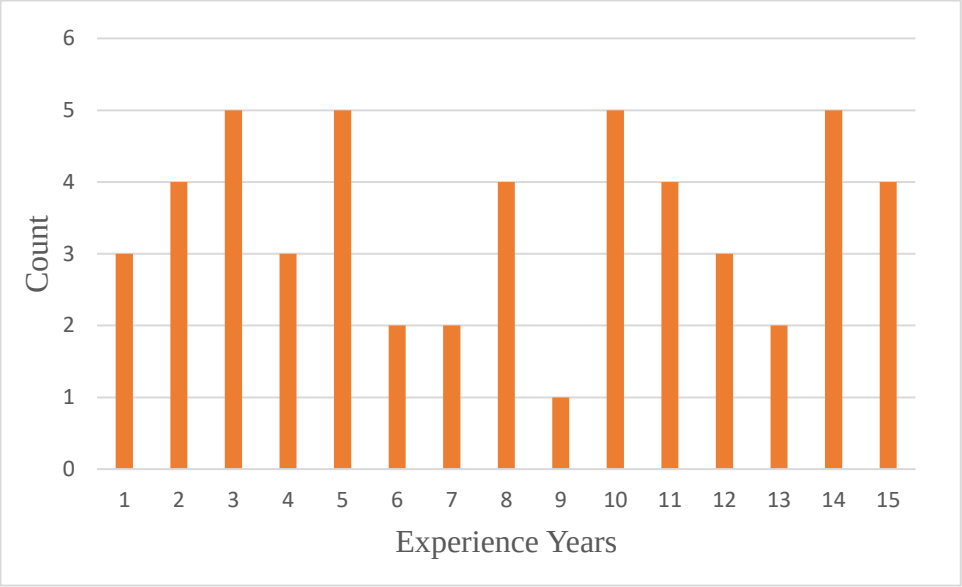

Figure 5: Participants' Years of Experience.

There are 4.5 years of experience on average.

5.2.Correlation analysis

Table 2: Analysis of the relationship between preferred motivational style and educational attainment.

		Education Level	**Which leadership style has the greatest potential to inspire you?**
Education Level	Pearson Correlation	2	-0.162
	Sig. (2-tailed)		0.369
	N	50	50
Which leadership style has the greatest potential to inspire you?	Pearson Correlation	-162	2
	Sig. (2-tailed)	0.369	
	N	50	50

There isn't any discernible relationship between the two variables. The table shows the findings of a Pearson correlation study that looked at the association between educational

ISBN - 978-93-95060-79-0

attainment and the chosen motivational leadership style. The first row's correlation coefficient shows a weak inverse association between education level and the likelihood of being motivated by a specific leadership style, with a negative correlation of -0.162. Nonetheless, the p-value (Sig. 2-tailed) is higher than the standard significance level of 0.05 at 0.369. Because of the high p-value, it is possible that the observed link is the result of chance rather than a statistically meaningful correlation. The identical data is shown in the second row, but the p-value and correlation coefficient are displayed differently. In conclusion, this analysis shows that among the 50 study participants, there is no statistically significant relationship between education level and the desire for a certain leadership style as a source of inspiration.

Table 3: Department and Preferred Leadership Style Correlation Analysis.

		Which leadership style has the greatest potential to inspire you?	**Department**
Which leadership style has the greatest potential to inspire you?	Pearson Correlation	2	0.321
	Sig (2-tailed)		0.090
	N	50	50
Department	Pearson Correlation	0.321	2
	Sig (2-tailed)	0.090	
	N	50	50

There isn't any discernible relationship between the two variables. The table displays the findings of a correlation study that looked at motivation and leadership styles in two distinct departments. Finding the leadership stance that will inspire employees in each department is the main goal. The degree and direction of the linear link between variables, in this case motivation and leadership style, are measured using the Pearson correlation coefficient. The first row's Pearson correlation coefficient, which is 0.321, shows that motivation and leadership style are positively correlated. The association may not be measurably huge at the conventional importance level of 0.05, as indicated by the importance level (Sig) of 0.090. For each department, the sample size (N) is 50. Consequently, these findings

ISBN - 978-93-95060-79-0

suggest that although motivation and leadership style have a favourable association, it is not statistically significant. More research or a bigger sample size could be required to reach more reliable conclusions regarding the connection between motivation and leadership style in these divisions.

Five workers were evaluated to affirm the overview's discoveries. Because of time requirements, the meeting was semi-organized and brief. Most of the inquiries came from the overview. Three out of five laborers for the most part agreed that extraordinary administration improves the probability of more prominent work fulfillment. Working with any sort of pioneer is certainly not a tremendous arrangement, as indicated by the other two representatives. I give an example of one of their responses in the section that follows:

Employee# 1: “Because he trusts me and provides me the chance to voice my thoughts, I love working with my boss.”

Employee# 2: “When my manager sets ambitious goals and motivates me to reach them, I'm thrilled”

Employee# 3: “Regardless of my fresh debut at the organization, I have seen that my chief is a ground-breaking chief who endeavours to draw out the best in each individual, and I view it as truly fascinating”

Employee# 4: “My manager is primarily interested in finding faults, and I sense that we are not on the same page”

Employee#5: “I am unable to collaborate with someone who magnifies my errors while downplaying my accomplishments; that is what my manager does”

The following topics have emerged from the employees' interview:

i. In request to motivate their workers, administrators should be kind, empowering, and focus on the prerequisites of their staff individuals.

ii. It's basic to hear what laborers need to say to improve the working environment and motivate staff individuals.

iii. Postponing mediation (transactional leadership) as late as possible might make negative impacts.

ISBN - 978-93-95060-79-0

6. RECOMMENDATIONS AND CONCLUSION

This research was conducted with the intention of examining the perceptions of employees working for private petrochemical companies on the leadership styles and the impact those styles have on the motivation of employees. This study used a blend of subjective and quantitative ways to deal with information assortment and examination. It has been found via the analysis of collected data that leaders who choose a leadership style that is both transformative and participative are more likely to establish an environment that is conducive to the motivation of their employees. From a general standpoint, it is possible that the employees who participated in this survey would favour transformational leadership over transactional leadership. The discoveries of this study are in accordance with those of different examinations. This study recommends that administrators who wish to be more successful may should be more moving, accommodating, and ingenious, and they ought to likewise attempt to build the gifts of their subordinates determined to expand their own adequacy. It is necessary to do additional research in order to compare the findings of the study with those of other businesses in the vicinity.

Recommendations:

- **Diversify Data Collection Methods:** it is recommended to incorporate additional data collection methods.
- **Include Comparative Analysis:** recommend incorporating a comparative analysis between different segments of the oil and gas industry.
- **Longitudinal Study for Dynamics Over Time:** Suggest conducting a longitudinal study to explore how the relationship between leadership and motivation evolves over time.
- **Explore Cross-Cultural Influences:** Given the international nature of the oil and gas industry, it is recommended to incorporate a cross-cultural analysis to understand how cultural factors may influence perceptions of leadership and motivation.
- **Engage Stakeholders for Actionable Recommendations**: To ensure the practical relevance of the research, suggest involving key stakeholders from the oil and gas

ISBN - 978-93-95060-79-0

sector in the analysis and interpretation of findings.

An examination of the effects of Artificial Intelligence on the digital transformation of human resources in the industrial sector

Prof.(Dr.) Vijay Kulkarni
Professor, School of Management
Director, Corporate and Executive Program, SOM,
Ajeenkya D Y Patil University, Pune Vijay.kulkarni@adypu.edu.in

Dr. Chetna N. Mehta
Associate Professor
MIT, World Peace University, Pune

Abstract

Mechanical technology development — which envelops both man-made intelligence and the Internet of Things (IoT) — has made computerized reasoning (artificial intelligence) a colossal open door in the work environment. Flexibility, Efficiency, and Precision are seen as the possible advantages of Industry. Many modifications are necessary for the implementation of Industry, one of which is the Human Resource (HR) role. In the business world, having strong HR capabilities is crucial and offers an advantage to the company. In order to respond to the challenges and demands, HR should be more circumspect and flexible. We research AI's contributions to industry practices and HR digitalization. 270 HR professionals with foundations in assembling, information innovation (IT), and organization were decided to partake in this assessment, which zeroed in on three parts of HR availability and five computer-based intelligence applications in HR capacity. Analysis of Moment Structures (AMOS) and the Statistical Package for Social Sciences (SPSS) program were utilized to research the assembled information. The discoveries showed that concentrating on various leveled associations is fundamental to accomplishing feasible turn of events. Every one of the five of the artificial intelligence application areas of HR support both human resource abilities and versatility. Upgrades in security and prosperity were viewed as fundamental components of the artificial intelligence application in HR.

Keywords: *Artificial intelligence, Structural equation modelling, Digitization Agility, Human resource management, Industry.*

1. INTRODUCTION

The Human Resource (HR) capability is fundamental in connecting the innovation and human resource holes in the cutting edge time of industry. Most of the positions that were formerly dealt with by human resources are currently being supplanted by innovation, however the need for adaptable HR administrations to deal with the challenges of overseeing individuals is as yet rising. Innovation can help with improving the HR cycle's dexterity to achieve this adaptability. Having the option to move quickly and smoothly is an idea that isn't new, and enormous organizations like Google, Apple, Facebook, Amazon, and Microsoft have embraced it. Nimbleness in HR alludes to the ability to help individuals, basic techniques, and hierarchical variation by answering rapidly and startlingly to changes in individuals and cycles.

Being deft as a learning and improvement or HR professional means being able to advance worker commitment and maintenance while keeping them in accordance with the general objectives of the business. HR Deftness functions admirably for dynamic HR undertakings where capability normalization is testing. Associations need their laborers to convey worth and focus on consumer loyalty to turn out to be more agile. But since the HR division isn't generally positioned to offer direct motivations to the client, it gets unfavorable criticism for answering gradually, which makes laborers troubled.

Therefore, to remain serious and attract top faculty, associations need to engage and urge HR to be more mindful of and receptive to developing business needs and mechanical progressions. HR actually handles recruiting, advancement, performance the board, and other HR undertakings in a dexterous association; it simply utilizes spry cycles. HR dexterity can be characterized as the accompanying three things: the ability to perceive issues almost immediately and make a move, the capacity to answer all the more rapidly and really, and the coordination of analysis and configuration remembering to distinguish, plan, and focus on drives that have the most obvious opportunity with regards to progress.

The quick advancement of innovation, especially the mix of computerized reasoning (artificial intelligence) in HR, has brought about eminent transformations in HR techniques and systems. It is basic to

ISBN - 978-93-95060-79-0

grasp what artificial intelligence means for a few HR features, including finance handling, representative comfort, wellbeing and security, staff efficiency, and continuous criticism, as organizations dynamically shift their HR capabilities on the web. Besides, understanding what hierarchical organization analysis and configuration are meant for by these HR exercises can give experiences into how organizations could utilize simulated intelligence to work on their general adequacy and productivity.

This study views at the connection among artificial intelligence and HR digitization as well as what HR digitization means for hierarchical organization analysis and plan. To decide the advantages and difficulties of HR digitization with regards to hierarchical organization analysis and plan, as well as to survey the effect of HR digitization on these two cycles, the exploration will take a gander at the connection between man-made consciousness (computer based intelligence) and HR digitization as far as estimating representative efficiency, further developing wellbeing and security, robotizing finance handling, estimating worker comfort, and giving constant criticism.

By satisfying these objectives, this examination paper desires to reveal insight into what man-made intelligence means for HR digitization and what HR digitization means for authoritative organization analysis and plan. Moreover, this examination attempts to give ideas to foundations in regards to the ideal use of simulated intelligence to enhance their HR methodology and approaches, subsequently enlarging the overall adequacy and proficiency of the association. The two significant features of HRM shrouded in this paper are (I) the application areas of man-made intelligence and (ii) the light-footed component of HRM. Because of the scarcity of concentrate to date, the parts estimating the two components were taken from idea papers and online distributions.

2. OBJECTIVES

- To evaluate how artificial intelligence might affect human resource management.
- To ascertain whether it is successful in meeting industry demands.
- Investigating the most recent AI developments in HRM practices.

ISBN - 978-93-95060-79-0

- To evaluate how AI will affect HRMP in order to meet industrial demands.
- To examine how AI affects industry sustainability

3. LITERATURE REVIEW

Yawalkar (2019), taken a gander at to figure out how man-made consciousness capabilities in the HR division and to comprehend the difficulties related with that too. Research papers, distributed materials, online diaries, HR web journals, and review reports from different exploration associations were utilized to gather optional information. The review configuration utilized by the analyst was spellbinding. It was resolved that the utilization of simulated intelligence by the HR division for various positions was developing, with advanced mechanics organizations ready to deal with errands like recruiting, information analysis, and social occasion, as well as decreasing work environment responsibility and working on hierarchical performance.

Bhardwaj et. al (2020), We out an exact review to examine the utilization of artificial intelligence and its effect on HRM because of mechanical headway with 115 HR professionals working in the IT business in the Delhi/NCR district. Deciding whether the advancement and convenience of HR capabilities moderate this connection was the point of the review. Solid connection between the two parts was found utilizing different relapse based presumptions, showing that expanded utilization of artificial intelligence in the work environment improves HR useful adequacy. Due of its high connection with both advancement and ease of use, man-made intelligence affects HR as far as both. Information with respect to man-made brainpower — which is setting off another modern transformation called Industry 4.0 — will be canvassed in this review.

Khatri et. al (2020), completed a review that analyzed the mix of computer-based intelligence-based innovations into an association, as well as the original open doors and troubles in human resource the executives that emerge from thinking about the organizations' non-tech and tech resources. An enlightening subjective survey technique in view of papers giving optional information was utilized by the scientist. periodicals, books, and so on. Successful procedures to coordinate computer-based intelligence into the association incorporate updating ranges of abilities to hold laborer resolve, robotizing

ISBN - 978-93-95060-79-0

their performance through reengineering, and expanding information on the advantages and disadvantages of innovation. Scientists have made two models that relate simulated intelligence and HRM. It was tracked down that for an association to develop and work, individuals and innovation should coordinate. Individuals need to turn out to be more talented and show that they will get new abilities through information-based approaches to contend with man-made intelligence.

Arslan et. al (2022), analyzed with an emphasis on the difficulties that HRM divisions and chiefs face in their associations because of the helpful understanding between simulated intelligence (robots) and human specialists at the group level. This study coordinates numerous surges of writing to break down the connection between artificial intelligence (especially robots) and HRM in contemporary associations. The discoveries exhibited the significance of hierarchical help systems, like preparation valuable open doors, a strong workplace, and certifications of a commonsense mechanical capability level, preceding setting human laborers in groups with robots. At long last, we tracked down that one of the most difficult issues for HRM to deal with was assessing performance in bunches where man-made intelligence (counting robots) and humans live together.

Kambur and akar (2022), led a review to foster a dependable and precise scale, figure out how HR staff individuals view artificial intelligence, and assess the progressions simulated intelligence has achieved in the HR division. An example of 821 HR directors and workers was provided by the greatest organization in Turkey. It was found that chiefs and representatives in human resources figured innovation would liberate them from dreary undertakings, decrease the strain of recognizing reasonable competitors, and give them admittance to a more extensive scope of chances. It was revealed that man-made reasoning (computer based intelligence) was incorporated into the representative preparation and advancement interaction, and that simulated intelligence will decrease preparing related interruptions.

Vrontis et al (2022), led exploration to recognize the primary drivers of HRM issues and issues, as well as to incorporate a complete rundown of scholastic commitments on insight computerization

ISBN - 978-93-95060-79-0

to date. 45 expected papers on artificial intelligence, advanced mechanics, and other state of the art innovation in HRM settings were completely looked. The outcomes show that savvy mechanization innovations present an original way to deal with worker oversight and improve hierarchical performance, presenting both significant open doors and difficulties for human resource the executives. It has been found that the effect of these state of the art advancements is focused on HRM works on, including employing, preparing, and work performance, as well as HRM techniques, including position substitution, independent direction, human-robot/man-made intelligence cooperation, and learning valuable open doors.

4. RESEARCH METHODOLOGY

4.1.Research Design

A cross-sectional illustrative examination configuration was utilized in the review. Since the examination philosophy empowers the gathering of information from a wide populace at an exact moment, it is reasonable for looking at the impact of simulated intelligence on the digitization of human resources in industry.

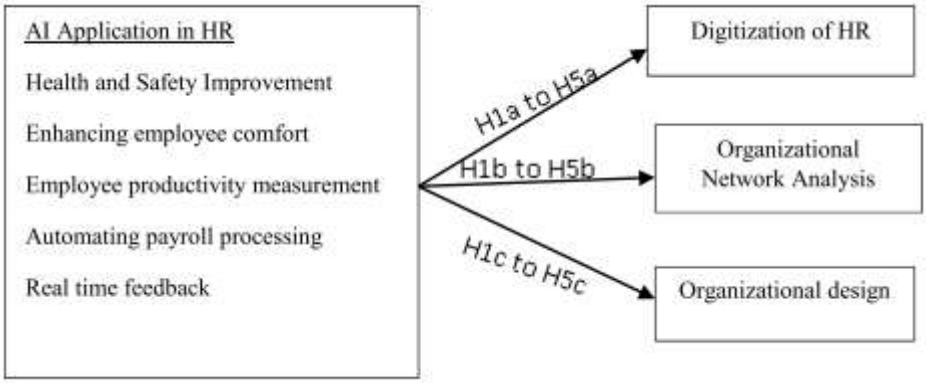

Figure 1: Proposed conceptual model.

4.2.Population and sampling

ISBN - 978-93-95060-79-0

Human resource professionals utilized in the assembling, ITES, IT, and administration areas in the Maharashtra urban communities of Pune and Nagpur made up the review's populace. These two cities were chosen since they are home to a variety of industries. The service sector included banks in the private sector. The geographic location was chosen in the first stage, the firms in each sector were ranked in the second stage, and the respondents were chosen from the selected firms in the third stage of a multi-stage sampling procedure. 338 questionnaires in all were submitted via a Google Form; 270 of them, with an 80% response rate, were deemed appropriate for study following additional review. Previous studies provide justification for a sample size of 270. For SEM analysis, a sample size of at least 150 is advised. 150–300 is regarded as an appropriate sample size for structural equation modelling. SEM analysis requires a sample size of at least 200, and bigger sample sizes are always preferable.

4.3.Scale development and validation

By modifying firmly related writing, new scales were made to quantify the develops utilized in the review model. The effectiveness of the scales in estimating the develops was then affirmed by testing them for different legitimacy and dependability measurements. Dependability is the consistency of estimation across time, though legitimacy is how much a scale estimates what it is intended to gauge. In this review, corroborative element analysis (CFA) was utilized to analyze the legitimacy and unwavering quality of the scales. The CFA results showed that the scales had great dependability and develop legitimacy. Specifically, all developments' composite dependability (CR) values were higher than the proposed cutoff worth of 0.7, showing solid inward consistency. Moreover, all builds' typical change removed (AVE) values were higher than the recommended limit worth of 0.5, showing solid united legitimacy. Subsequently, it was resolved that the scales utilized in this examination were fitting for estimating the important builds.

4.4.Data collection

The research was supported by data collected through the use of a standardised questionnaire. The instrument is divided into three sections, the first of which has questions about demographics. Human Resource Agility is measured by the assertions in the third and final

ISBN - 978-93-95060-79-0

section, which is about AI applications in HRM. Parts two and three employed the Likert Scale, which has five points.

5. DATA ANALYSIS AND INTERPRETATION

5.1.Data Analysis

AMOS was utilized to assess the proposed model after SPSS was utilized for essential statistical analysis of the obtained information. The legitimacy and unwavering quality of the scales utilized in this review were tried, and the outcomes were acceptable to proceed with the examination.

By taking a gander at every variable's skewness and kurtosis values, the scientist affirmed multivariate ordinariness, and all values fell inside the reasonable scope of - 2 to +2. They likewise utilized greatest probability assessment, which is predicated with the understanding of multivariate ordinariness. The listwise erasure strategy, which kills cases with missing qualities from the analysis, has been utilized to address missing information. A definitive example size of 270 was more prominent than the insignificant example size proposed for SEM analysis. By utilizing a deduced model that was established on before research and hypothetical underpinnings, they had the option to ensure exact model definition. Corroborative component analysis was likewise completed to assess the model's integrity of-fit.

Table 1: The constructs' validity and dependability.

Constructs	α	CR	AVE	MSY	ASV	HIS	EEC	EPM	APP	RTF	DHR	ONA	OD
Wellbeing and Security Improvement	0.951	0.926	0.650	0.631	0.502	0.809							
Improving employee comfort	0.936	0.932	0.586	0.52	0.498	0.701	0.764						
Employee efficiency estimation	0.930	0.931	0.580	0.50	0.460	0.733	0.679	0.765					
Automating payroll processing	0.976	0.964	0.780	0.535	0.330	0.609	0.569	0.530	0.880				
Instantaneous feedback	0.903	0.893	0.521	0.511	0.382	0.686	0.594	0.535	0.553	0.725			
Digitization of HR	0.966	0.921	0.501	0.321	0.247	0.488	0.519	0.485	0.420	0.412	0.707		
Network Analysis of Organisations	0.902	0.900	0.568	0.489	0.460	0.684	0.671	0.732	0.580	0.568	0.483	0.752	

ISBN - 978-93-95060-79-0

Design of organisations	0.947	0.913	0.728	0.642	0.546	0.788	0.768	0.714	0.616	0.670	0.550	0.735	0.84

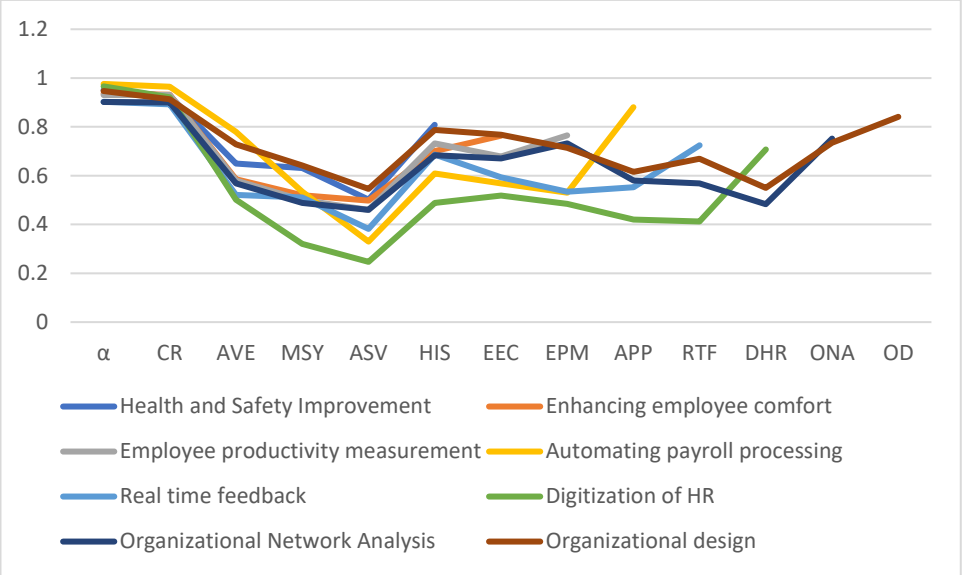

Figure 2: The constructs' validity and dependability.

The criteria for determining reliability, discriminant validity, and convergent validity are shown in Table 1. Table 1, represented by $\boldsymbol{\alpha}$, is also known as Cronbach Alpha and is used to gauge how reliable the study's construct is. Any value of Cronbach alpha above 0.75 is expected. Table 1 presents constructs with Cronbach alpha values greater than 0.7, indicating the dependability of the study's variables. Another dependability metric included in Table 1 is called Composite dependability, or CR. The primary application of this composite dependability is in path modelling, which incorporates error into the computation. The Cronbach Alpha value of more than 0.8 and the CR cutoff level are the same. The most important factor in determining validity is Average Variance Extracted (AVE).

When compared to the other study constructs, the variation derived by the items under the components is explained by the value of AVE. The AVE is predicted to have a minimum value of 0.6. All of the study's constructs meet these convergent validity requirements. For each dormant variable in the examination, the Average Shared Value (ASV) and Maximum Shared Value (MSV) should be not exactly the AVE to assess the discriminant legitimacy. Table 1 shows that the AVE value for every one of the builds remembered for the review is more

ISBN - 978-93-95060-79-0

prominent than the MSV and ASV values. This tracking down upholds the presence of discriminant legitimacy for the builds remembered for the review.

Considering that the review's Kaiser-Meyer-Olkin (KMO) insights value is 0.871 — over the base recommended value of 0.7 — factor analysis is considered suitable for the information and the example size is considered adequate. Bartlett's trial of sphericity is utilized to decide if the relationship network is adequate. The test is exceptionally critical at a degree of $P < 0.003$, with a test value of 875.01 and a level of importance under 0.0002, demonstrating that the relationship framework shows significant connections among at any rate a portion of the factors, as indicated by the test discoveries. The factors are therefore not symmetrical, and the speculation that the connection lattice is a personality grid is dismissed. Considering that the critical value is under 0.06, apparently factor analysis of the dataset would be helpful.

5.2.Results

Table 2: Demographic profile of respondents.

Demographic Variable	Category	No of Respondents	Percentage of the Respondents
Gender	Male	180	66.67%
	Female	90	33.33%
Age	21-30	77	28.5
	31-40	116	42.9%
	41-50	39	14.4%
	>50	38	14.2%
Education	Master's degree	95	35.2%
	Bachelor's degree	175	64.8%
Industry Type	Manufacturing	79	29.26%
	IT and ITES	120	44.44%
	Service Sector	71	26.3%

The survey's demographic data, which includes the respondents' age, gender, level of education, and industry, is included in the table. When it comes to gender, 33.33% of

ISBN - 978-93-95060-79-0

respondents are female and 66.67% of respondents are male. In terms of age, the age group that comprises the largest proportion, 31–40, accounts for 42.9% of the total, while the 21–30 age group accounts for 28.5%. Of the respondents, 14.4% are over 50 and 14.2% are between the ages of 41 and 50.

With regards to instruction, 64.8% of respondents have a four year college education, and 35.2% have a graduate degree. The survey participants are dispersed throughout many industry categories, with the largest proportion found in the IT and ITES sector at 44.44%. This is followed by manufacturing at 29.26% and the service sector at 26.3%. The majority of respondents in the study are men, and their ages and educational backgrounds are varied. The study's considerable representation of the IT and ITES industry is indicated by the majority of respondents.

Utilizing Analysis of Moment Structures (AMOS 20) software, the proposed applied model was tried utilizing the Structural Equation Demonstrating (SEM) method. It examines the route relationship that exists between the HR Agility dimensions and the AI application dimensions, or independent and dependent variables, respectively.

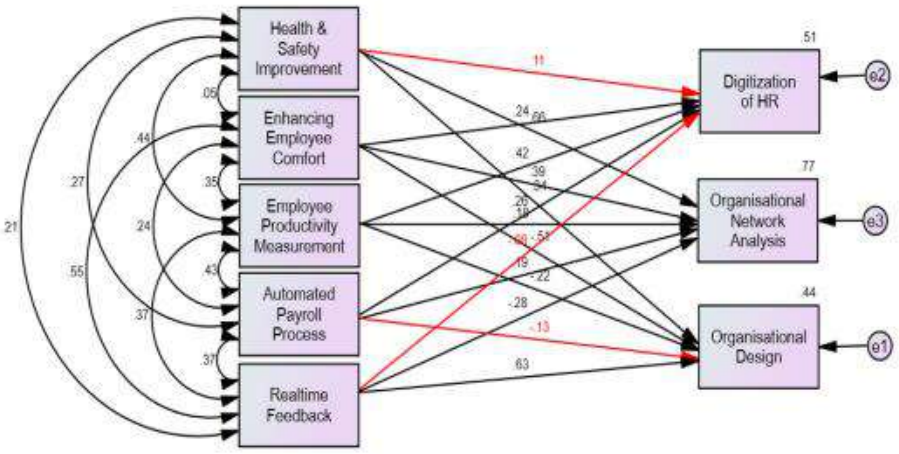

Figure 3: Conceptual Model Hypothesis.

Three causal connections — simulated intelligence Application and Hierarchical Organization Analysis, man-made intelligence Application and Authoritative Plan, and artificial intelligence Application and Digitization of HR — are displayed in Fig. 3. Red-shaded lines are not statistically huge.

ISBN - 978-93-95060-79-0

Table 3: Results of the conceptual model.

Hypothesis	Path	Standardized Co-efficient	P-value	R2
H_{1a}	Employee efficiency estimation - Digitization of HR	.420	***	0.506
H_{2a}	Wellbeing and Security Improvement - Digitization of HR	.111	.088	
H_{3a}	Automated Payroll Process - Digitization of HR	259		
H_{4a}	Improving employee comfort - Digitization of HR	240	***	
H_{5a}	Instantaneous feedback - Digitization of HR	-.082	.245	
H_{4b}	Real-time Feedback - Network Analysis of Organisations	-.276	...	0.774
H_{5b}	Improving employee comfort 1 Network Analysis of Organisations	.388	***	
H_{6b}	Wellbeing and Security Improvement - Network Analysis of Organisations	.672	***

ISBN - 978-93-95060-79-0

The study examined the correlations between different hypotheses (H1a to H8) and their related paths, standardised coefficients, P-values, and R2 values in relation to organisational design, organisational network analysis, and HR digitalization. The results are shown in the table. With a standardised coefficient of 0.420, a high level of significance indicated by three asterisks (***), and an R2 value of 0.506, Speculation H1a shows a huge positive connection between Employee productivity assessment and the Digitization of HR. This means that this model explains 50.6% of the variability in the dependent variable.

The statistical significance of the correlations between Hypotheses H2a, H3a, and H5a is not demonstrated by their P-values, which above the standard cutoff of 0.05. H4a, on the other hand, shows a strong positive correlation with a high degree of significance (***) and a standardised coefficient of 0.240 regarding improving employee comfort through the digitization of HR. Next, let's look at the organisational network analysis. The results for H4b, H5b, H6b, H1b, and H2b, all indicated with three asterisks (***), indicate significant relationships with standardised coefficients of -0.276, 0.388, 0.672, 0.178, and 0.196, respectively.

H6c (Improving employee comfort through Organisational Design) has a particularly strong negative relationship, as indicated by a standardised coefficient of -0.512, marked with three asterisks (***), and an R2 value of 0.442. H5c, H4c, H7, and H8 all show significant relationships in the context of organisational design. Overall, these results indicate that different hypotheses have varying effects from organisational network analysis, organisational design, and HR digitalization, with some elements statistically significantly influencing the outcomes and others not reaching statistical significance.

6. RECOMMENDATIONS AND CONCLUSION

AI implementation in HRM offers the HR division and staff a number of advantages. These benefits come with some legal and network safety risks, though. More employee data means greater security risks, and as devices proliferate, so do the opportunities for network security breaches. Organisations must make sure that employee data is secure before implementing AI across the board. In order

ISBN - 978-93-95060-79-0

to reduce network security risks, associations must also develop information-driven security to filter information itself rather than just organisation. The implementation of AI ideas in several potential HRM domains has been covered in the paper. It's possible that these places are not included in the usual schedule of events. However, it is attempting to enforce the significance of addressing the same—the dimensions assessed under which the improvement of human qualities through AI is demonstrated. The outcome demonstrated how these factors affect HRM's capacity for agility. The closed-loop technology impact of HR, known as the digitization of HR and ONA, allows for an iterative process of function. To facilitate their implementation and advancement, the aforementioned elements require a first-rate organisational structure. By establishing a connection between two aspects of the current industrial era, this study therefore cleared a new path. Since simulated intelligence is as yet a somewhat new and underutilized point, particularly in India, very few organizations are using it in HRM or creating artificial intelligence-based HR software. Since most firms just utilize computer-based intelligence partially in the HR cycle, gathering a full analysis is troublesome. Although artificial intelligence (AI) has been the topic of much research, there aren't enough companies using AI in HR practices to allow for a thorough analysis of the technology's actual effects and implications.

Recommendations:

- Expand the Scope of the Study Given the dynamic nature of artificial intelligence (AI) and its impact on human resource management (HRM), it is recommended to consider extending the scope of the study to include a more diverse set of industries and geographic locations.
- Incorporate Longitudinal Analysis To gain a deeper insight into the evolving relationship between AI and HRM, it is advisable to incorporate longitudinal analysis in future research.
- Explore Employee Perspectives While the current research focuses on HR professionals, it is essential to consider the perspectives of

ISBN - 978-93-95060-79-0

employees who interact with AI technologies in the workplace.

- Assess the Role of Organizational Culture To enhance the understanding of AI's impact on HRM, it is recommended to delve into the role of organizational culture in facilitating or hindering the successful integration of AI technologies.
- Explore Sustainable Practices Given the growing importance of sustainability in various industries, it is suggested to investigate the potential contributions of AI to sustainable HRM practices.

Abstract

With regards to exchanging on the securities exchange, machine learning is turning out to be progressively present. To determine whether or not the machine learning method is equipped for recovering data from past costs and anticipating value development and future patterns, the reason for this article is to research the chance. In a model that depends on machine learning, we explore the act of utilizing pattern exchanging pointers. To give dependable positive pointers to the developments of stock costs, we present calculations that consolidate various crucial and specialized information. Huge information from the securities exchange that is of high volume, high speed, high assortment, and high changeability is utilized in this paper to apply machine learning methods, for example, strategic relapse, choice trees, neural networks, and man-made brainpower. These strategies are applied to large information utilizing constant and disconnected information of changing time granularities. An investigation was performed on the results of the prescient calculations, and the discoveries were given. The aftereffects of the trials showed that the utilization of machine learning and man-made consciousness strategies can help out in the determination of high-performing stock portfolios that exhibit better execution than the financial exchange.

Keywords: *Algorithms, Decision Trees, Financial Markets, Logistic Regression, Machine Learning, Neural Networks, Stock Market Trading.*

1. INTRODUCTION

The Indian stock market offers a vibrant and fascinating environment for learning about finance, especially the Maharashtra stock market. Even though short-term swings can seem random, experienced traders can spot underlying patterns that can be used to make profitable investments. Making use of extensive elements, such as fundamental and

technical data, machine learning algorithms provide a potent instrument for lucrative stock movement prediction. This strategy clearly performs better than conventional approaches that only use numerical features. A significant obstacle in the Indian market, especially in Maharashtra, is locating high-potential equities while reducing human error and emotional prejudice.

Researchers in Maharashtra were able to identify high-yielding healthcare equities by utilising a combination of technical and fundamental analysis within a Support Vector Machine (SVM) framework. Then, profit-making transactions were enabled by automated trading algorithms that operated without human intervention, resulting in an incredible 16.64% return over a three-month period. Subsequent studies looked into the possibility of a portfolio of healthcare companies chosen by logistic regression beating market benchmarks such as the Healthcare Sector Index (XHJ) and the ASX All-Ordinaries Index over a 20-day trading window. With a hefty 18.24% return, the portfolio produced encouraging results.

Researchers used machine learning and a unique trading strategy to mix technical and fundamental data while concentrating on the Small Cap sector of the Indian stock market. Their goal was to find out if a data-driven strategy could reliably pinpoint equities that could outperform the market. The researchers carried out a number of paper deals to confirm and validate their selection process. In April of 2021, the three best training equities that had been determined in March were paper traded, and the procedure was then repeated in the following months. This thorough testing proved the selection process's effectiveness and showed that it can reliably find successful stock portfolios.

Researchers in Maharashtra have taken in an extraordinary arrangement about determining future examples and cost developments in the Indian securities exchange by utilizing calculations like strategic relapse, choice trees, and neural networks. These developments present investors looking to use data-driven tactics to generate higher profits with exciting chances.

One powerful subset of artificial intelligence (AI) is machine learning. At its core, it is the process of teaching computers to recognize, analyses, and draw conclusions from complex patterns found

ISBN - 978-93-95060-79-0

in data sets. Rather than utilizing unequivocal programming, the framework utilizes its capacity to gain from and change its insight from past information to accomplish this understanding and translation. Therefore, machine learning represents a substantial departure from conventional programming paradigms that involve giving machines explicit instructions. Rather, robots can now independently generate and apply logic in dynamic circumstances thanks to machine learning.

This change has had a significant influence, and machine learning has been used in many different fields. For example, machine learning is used in natural language processing to train computers to comprehend, analyse, and even produce content that appears human. Many of the chatbots and digital assistants of today are powered by this technology, which makes interactions between humans and robots more intuitive and natural. Similar to this, machine learning techniques are employed in image recognition to find and decipher patterns in images. This has a wide range of uses, from using medical imaging to diagnose diseases to enabling autonomous cars to drive by identifying barriers and road signs.

Machine learning is utilized in network protection and misrepresentation to perceive designs, as odd examples might show gambles or illegal action. Last but not least, predictive analysis makes use of machine learning's predictive powers to help firms predict market dynamics, consumer behaviour, and trends. It is true that machine learning has a great deal of versatility and that there is always room for other uses for it. Finding a summary of the research and publications that have been done on machine learning in the financial domain is interesting. One important subject that is directly related to the economy is finance. For instance, financial technology have gained popularity among organisations within the past ten years.

Machine Learning problematically affects the universe of monetary information and innovation. AI calculations have introduced another period of information driven independent direction by significantly affecting a few areas of money, including risk relief and portfolio the executives. Foreseeing market developments is a basic utilization of AI in the money business. It has demonstrated challenging for conventional market investigation models to represent the unpredictability and intricacy of monetary

ISBN - 978-93-95060-79-0

business sectors. Be that as it may, with AI, complicated designs in the information can be found and used to make undeniably more exact expectations about how the market will move from now on.

Another area where AI has demonstrated helpful is in the assessment of venture possibilities. AI calculations can assess gigantic volumes of monetary information to survey the conceivable return and chance related with different speculation prospects through information mining and prescient demonstrating. Monetary consultants, mutual funds chiefs, and individual financial backers — every one of whom need exact and quick data to settle on shrewd venture choices — have viewed these capacities as very accommodating.

Machine learning has also revolutionised the field of fraud detection. Historically, identifying fraudulent transactions has been a laborious and prone to error process. But abnormalities may be found more quickly and precisely thanks to machine learning's pattern recognition abilities, shielding consumers and businesses from monetary loss. Furthermore, the emergence of FinTech highlights the widespread impact of machine learning in the finance industry. Our understanding of money and transactions has changed as a result of cryptocurrencies and decentralised finance made possible by blockchain technology, which is supported by machine learning. Likewise, machine learning-driven automated trading platforms and smart contracts are redefining stock trading and commercial transactions.

Even with these noteworthy developments, machine learning's potential in the banking industry is far from being fully realized. There are still a ton of uncharted research and application possibilities, which will surely result in further ground-breaking discoveries. This insight highlights the importance and timeliness of our research, which aims to set the direction for next studies and machine learning applications in the finance industry.

2. OBJECTIVES

- To evaluate the state of machine learning applications in the financial markets sector at the moment in order to spot emerging trends.
- To look into how machine learning affects the industry's financial decision-making processes, with a focus on the

ISBN - 978-93-95060-79-0

precision and effectiveness of predictive models.

- To examine the difficulties and constraints involved in applying machine learning to the financial markets, considering things like model interpretability, data privacy, and regulatory compliance.
- To compare the merits and drawbacks of different machine learning algorithms and assess how well they perform in forecasting risk variables, asset values, and market movements.

3. LITERATURE REVIEW

Wong et al., (2021), The use of deep learning techniques in financial technology (FinTech) is the special subject of this study. The use of deep learning in FinTech is reviewed by the writers in a number of domains, including as credit scoring, client segmentation, insurance pricing, and regulatory compliance. They highlight the notable advantages deep learning provides over more conventional approaches and suggest fruitful avenues for future research.

Sharma & Sharma, (2020), An extensive overview of the many machine learning applications in the financial industry is given by this thorough survey. The writers talk about how machine learning can be used for portfolio management, algorithmic trading, credit risk assessment, and fraud detection. They provide insightful information for future research areas and demonstrate how machine learning has the ability to completely transform the financial services industry.

Nawaz et al., (2023), This study looks into how well hybrid machine learning models can forecast changes in the stock market. The writers examine several pairings between deep learning architectures like LSTMs and conventional machine learning algorithms like Support Vector Machines (SVMs) and Random Forests. According to their findings, hybrid models outperform solo models in terms of prediction accuracy.

Mittal & Deep, (2020), This study assesses and differentiates a few profound learning models at foreseeing stock costs. The creators evaluate a mixture LSTM-GRU model, Gated Recurrent Units (GRUs), Long Short-Term Memory (LSTM) networks, and Recurrent Neural

ISBN - 978-93-95060-79-0

Networks (RNNs). As per their outcomes, LSTMs and GRUs perform better compared to other models in terms of forecast precision.

Livieris et al. (2022), An extensive review of data mining and machine learning methods applied in financial markets is given by this survey. The techniques, which include risk management, portfolio optimisation, and market prediction, are categorised by the writers according to their intended uses. For scholars and practitioners looking to comprehend the state of machine learning in finance, this paper is an invaluable resource. It might, however, benefit from a more thorough examination of current developments and developing patterns.

Lu et al. (2022), In order to predict financial markets, this paper presents a hybrid deep learning model with an attention mechanism. By fusing a Transformer design with a convolutional neural network (CNN), the suggested model is able to identify both short- and long-term dependencies in financial data. By outperforming baseline models, the model demonstrates the potential of attention mechanisms in financial applications. Examining the interpretability of the attention process and how it affects model predictions, however, could improve the research.

Mangal and Kaur (2021), A correlation of many profound learning models for stock value expectation is introduced in this work. Utilizing verifiable stock information, the creators survey how well LSTM, Recurrent Neural Networks (RNNs), and Convolutional Neural Networks (CNNs) perform. According to their results, LSTMs typically obtain the highest accuracy, demonstrating how well they can capture temporal connections in financial data. Comparing various hyperparameter setups and examining the effects of data preparation methods, however, could enhance the research.

4. RESEARCH METHODOLOGY

4.1.Data Capture

For 2,000 values recorded on the Indian stock trades, with an accentuation on Maharashtra, everyday stock information, including Open, High, Low, Close, and Volume, was procured

ISBN - 978-93-95060-79-0

from [www.eoddata.com] for the time of January 2, 2021, to June 30, 2021. The daily statistics for the Nifty 50 Index and the Nifty Small cap 50 Index were obtained from finance.yahoo.com. Because small-cap companies have the potential to see substantial price growth—especially in a month—we decided to concentrate on them for short-term trading. Even while trading small-cap stocks naturally involves a higher level of risk, we try to reduce it by only choosing stable businesses.

The procedure for gathering data and analysing it further is provided in the flow chart below:

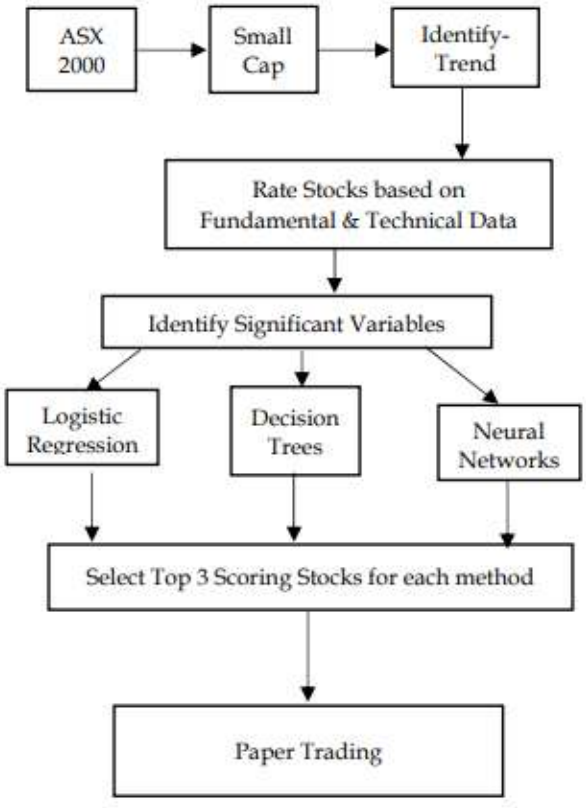

Figure 1: Steps.

4.2.Data Modelling

Since the objective variable, "Pattern," is a classification variable, three techniques were utilized in the information displaying method. A few instances of these are strategic relapse, brain organizations, and choice trees. There were 24 particular changes of the five factors

ISBN - 978-93-95060-79-0

(open, high, low, close, and volume) that were input into the model. The "20 Moving Normal," "200 Moving Normal," "50 Moving Normal," and comparative factors were made to demonstrate.

4.3.Logistic Regression

A remarkable sort of relapse known as strategic relapse includes relating a bunch of informative indicator factors — which might be discrete or constant — to the paired result variable. At the point when there isn't generally a straight-line connection between the objective and info factors, a nonlinear or calculated relapse model is utilized. At the point when the autonomous factors are ceaseless or discrete and the reliant variable is dichotomous, one technique for making expectations is called strategic relapse.

In strategic relapse, the blend of values taken by the indicator factors is utilized to address the likelihood of choosing that reaction. The coefficients (together with their standard deviations and importance levels) of an equation to conjecture a logit change of the probability of an intriguing trademark happening are created by coordinated factors relapse:

$$\text{logit}(p)=b_0 + b_1X_1+b_2X_2+b_3X_3+b_4X_4+\ldots..+b_kX_k$$

$$\text{logit}(p)=\ln(p/1-p)$$

In strategic relapse, assessment chooses boundaries that augment the likelihood of noticing the example values, rather than boundaries that limit the amount of squared mistakes, as in traditional relapse. The advantage of utilizing Calculated Relapse is that factors don't must have typical conveyances; all things being equal, they can be constant, discrete, or any mix of the two by the expansion of a reasonable connection capability to the standard straight relapse model. Multivariate insightful models like strategic relapse are ideal while foreseeing the presence or nonappearance of a trademark or result in light of upsides of a bunch of indicator factors. Strategic relapse is utilized to break down stock execution in the Indian financial exchange. We are curious as to whether applying strategic relapse to anticipate stocks on the Australian Securities exchange will likewise prompt the choice of performing stocks

4.4.Decision Trees

ISBN - 978-93-95060-79-0

A fundamental class of calculations for prescient displaying is choice trees. Choice trees are truly adept at depicting the circumstances and logical results connections in information. Their trial cross breed choice tree and brain network model gave reliable rules to assist financial backers with choosing when to execute their venture, and it had 77% guaging precision in the electronic business. Among the best AI procedures are choice trees. Since the gatherings that are created can be further partitioned utilizing a similar technique, the calculation is recursive in nature.

In view of this technique, the calculation is likewise alluded to as a voracious calculation due to the mind-boggling want to decrease the expense. The Gini score is the expense capability utilized in characterization to find the most homogenous branches or branches having bunches with equivalent reactions since this exploration centers around paired arrangement. In light of how uniformly conveyed the reaction classes are among the gatherings that the split makes, a split's quality can be assessed utilizing a Gini score. G is equivalent to sum(pk (1-pk)). The level of same class inputs in a given gathering is signified by pk for this situation. A hub with a 50-50 split of classes in a gathering has the least virtue; for a twofold order, it has pk=0.5 and G=0.5. A consul class virtue is the point at which a gathering has all contributions from a similar class, wherein case pk is either 1 or 0 and G=0.

5. DATA ANALYSIS AND INTERPRETATION

Recall and area under the curve are two significant measures for evaluating the exhibition of AI models. The suggested least qualities for "recall" and "area under the curve" are 0.8 and 0.9, separately. Because of the fantastic aftereffects of the "recall" and "area under the curve" measurements, paper exchanging was allowed.

Table 1: April 2021 Paper Trading Results

Algorithms	Recall	Area under curve	Return on investment (%)
Logistic regression	0.98	0.925	0.40
Decision trees	0.84	0.934	0.93
Neural networks	0.94	0.970	0.38

ISBN - 978-93-95060-79-0

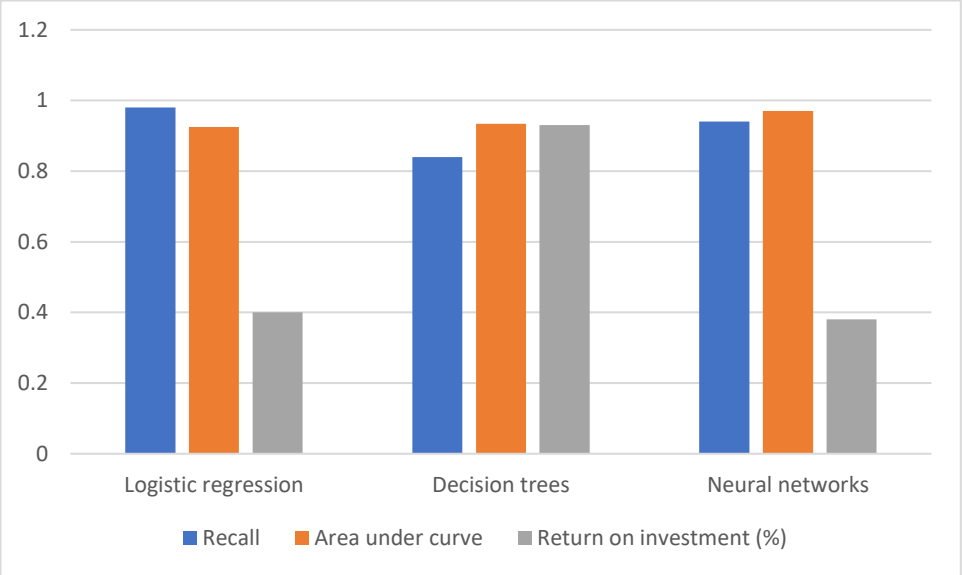

Figure 2: April 2021 Paper Trading Results

The paper trading outcomes for the different algorithms in the month of April 2021 are shown in Table 1. Three performance metrics—Recall, Area Under Curve (AUC), and Return on Investment (ROI) percentage—were used to compare three algorithms: Neural Networks, Decision Trees, and Logistic Regression. With a recall of 0.98, Logistic Regression showed a high degree of performance in accurately identifying positive events. Calculated Relapse's Area under the Curve (AUC) was 0.925, showing a decent generally speaking exhibition in example characterization. Nevertheless, this algorithm's Return on Investment (ROI) percentage of 0.40 was rather low.

However, Decision Trees showed a lower recall of 0.84, suggesting that recall and precision may need to be traded off. In spite of this, its AUC of 0.934 shows that it can distinguish between classes quite well, and its ROI % of 0.93 is noticeably higher. Neural Networks showed a balanced performance in recognising good events, with a recall of 0.94. With an AUC of 0.970, it appears to have better class discrimination capabilities, and its ROI % of 0.38 is similar to that of logistic regression. In conclusion, Neural Networks performed better in AUC and Decision Trees performed better in ROI compared to the other methods. While the ROI was somewhat low, the recall was excellent for Logistic Regression. Specific trading goals, such as emphasising accuracy, overall classification performance, or return on investment, may influence the choice of algorithm.

ISBN - 978-93-95060-79-0

Table 2: May 2021 Paper Trading Results

Algorithms	Recall	Area under curve	Return on investment (%)
Logistic regression	0.96	0.934	8.12
Decision trees	0.70	0.968	8.12
Neural networks	1	0.983	8.12

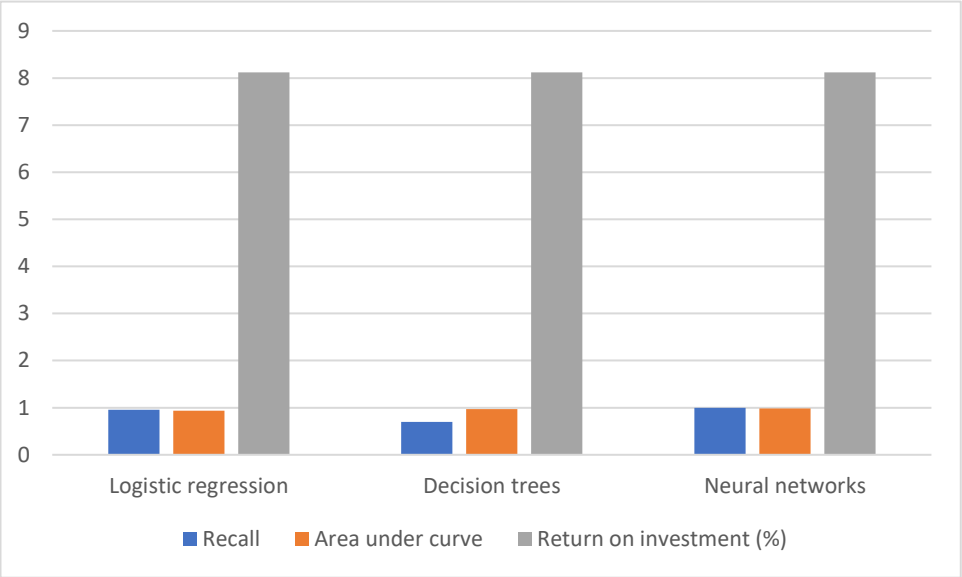

Figure 3: May 2021 Paper Trading Results

Table 2 shows the paper trading outcomes for a range of algorithms in May 2021. The algorithms' performance is assessed using three primary metrics: ROI %, area under the curve (AUC), and recall.

At a recall rate of 0.96, the first algorithm—logistic regression—showed that it was capable of accurately detecting positive cases. With an AUC of 0.934, logistic regression appears to have a very good overall predictive performance. This algorithm's Return on Investment is 8.12%, demonstrating its profitability over the given time frame.

When compared to logistic regression, the second approach, decision trees, had a poorer recall of 0.70. In spite of this, decision trees have an exceptionally high AUC of 0.968, indicating strong discriminating power. Decision trees have a Return on Investment of 8.12%, which is comparable to that of logistic regression and indicates profitability.

ISBN - 978-93-95060-79-0

Neural networks, the third approach, had an amazing recall rate of 1, indicating that it was able to identify every good instance. Neural networks have an outstanding overall predictive accuracy, as evidenced by their 0.983 AUC. Neural networks have a Return on Investment of 8.12%, which is consistent with the profitability of the other algorithms.

All three algorithms—logistic regression, decision trees, and neural networks—performed well in May 2021, according to the paper trading data, each with a specialty in a certain area of predictive modelling. Even though the algorithms' recall rates and AUC values varied, the consistent Return on Investment shows that they were all successful in making money throughout the given time.

Table 3: June 2021 Paper Trading Results

Algorithms	Recall	Area under curve	Return on investment (%)
Logistic regression	0.96	0.934	3.55
Decision trees	0.70	0.968	2.61
Neural networks	0.91	0.983	5.73

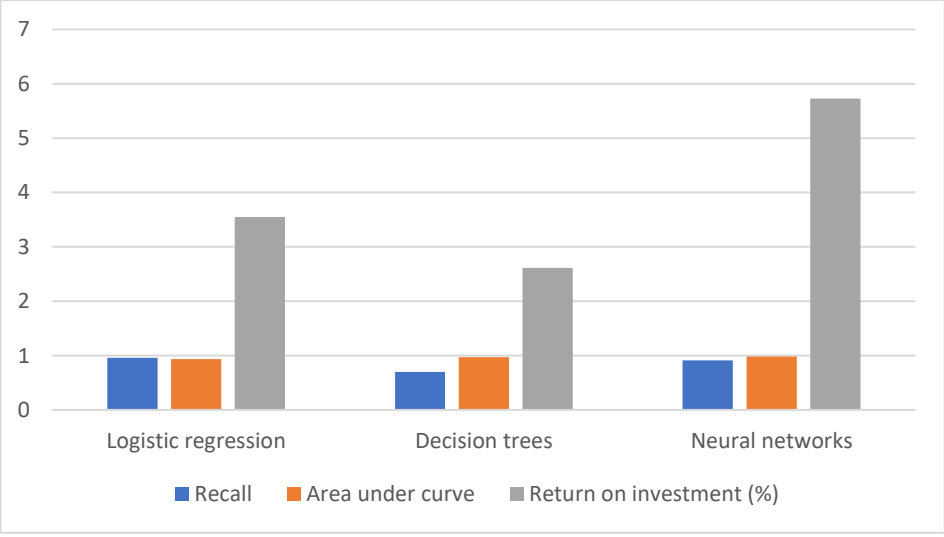

Figure 4: June 2021 Paper Trading Results

With an accentuation on execution pointers like review, area under the curve (AUC), and profit from venture (return for capital invested), Table 3 shows the paper exchanging results for different calculations June 2021. The logistic regression algorithm showed a significant AUC of 0.934 and a high recall rate of 0.96,

ISBN - 978-93-95060-79-0

both of which indicate the system's ability to correctly identify positive cases. With a similar ROI of 3.55% for logistic regression, the investment returned appears to have been worthwhile. On the other hand, decision trees demonstrated a higher AUC of 0.968 but a lower Recall of 0.70, suggesting a comparatively lesser accuracy in catching positive instances. Decision trees showed a somewhat lower return on investment, with a ROI of 2.61%. Neural networks performed exceptionally well in AUC, with a value of 0.983, and showed a Recall of 0.91, balancing the use of decision trees and logistic regression. Neural networks outperformed the other two algorithms in terms of yielding returns on capital invested, as seen by their higher ROI of 5.73%. Overall, the findings imply that within the given time period, neural networks performed better in terms of Recall, AUC, and ROI than both logistic regression and decision trees.

6. RECOMMENDATIONS AND CONCLUSION

This study examines if it is feasible to choose high-performing small-cap stocks in the Maharashtra, India market by using a data-driven strategy. To evaluate their efficacy in identifying profitable stock portfolios, machine learning methods such as Neural Networks, Decision Trees, and Logistic Regression were applied. The outcomes demonstrated how well these models worked at finding top-performing portfolios that regularly outperformed the market. Every stock portfolio that was created saw positive returns over a three-month period (March 2021 - May 2021). The Decision Tree portfolio beat the market during the first period (March 2021), while the Neural Network and Logistic Regression portfolios performed similarly. In particular, the portfolios for May 2021 and June 2021 outflanked the market by at least 2.6 times. This study adds to the rising measure of examination showing how well information driven methodologies — specifically, AI — foresee securities exchange results. The results point to the possibility of accurately identifying stocks that show promise and have strong growth potential. More trials with varying market capitalizations and sectors are strongly advised to improve the comprehension and practicality of this technique.

Recommendations:

- **Diversify Machine Learning Algorithm Evaluation:** To

ISBN - 978-93-95060-79-0

enhance the robustness of the study, it is recommended to expand the evaluation of machine learning algorithms beyond the ones currently employed.

- **Explore Ethical Implications and Regulatory Compliance:** Given the constraints and difficulties in applying machine learning to financial markets, particularly in areas like model interpretability, data privacy, and regulatory compliance, it is essential to delve deeper into the ethical implications of these challenges.
- **Extend Temporal Scope and Geographic Focus:** To capture a more nuanced view of machine learning applications in financial markets, it is advisable to extend the temporal scope of the study.
- **Incorporate Additional Financial Instruments:** To provide a more comprehensive analysis of the financial markets, the study could consider incorporating additional financial instruments beyond stocks.
- **Enhance Model Interpretability and Explainability:** Addressing the challenge of model interpretability is crucial in gaining the trust of stakeholders and regulators. It is recommended to explore and implement techniques that enhance the interpretability and explainability of machine learning models.

Abstract

This study explores consumer attitudes and beliefs towards marketing, consumerism, government regulations, and consumer responsibilities, with a focus on how these attitudes vary across different demographic factors, particularly income levels. The research employs a structured survey methodology to gather attitudinal data from a diverse sample of participants representing various marital, occupational, educational, age, and gender categories. Demographic analyses reveal a comprehensive snapshot of the surveyed population, laying the foundation for a nuanced understanding of consumer attitudes. The study delves into the mean scores and standard deviations associated with different attitudinal variables, uncovering patterns in consumer sentiments. Notably, an income-based comparison demonstrates significant variations in attitudes, with higher income levels correlating with more positive perceptions. The findings underscore the importance of tailoring marketing strategies and regulatory frameworks to diverse demographic segments. Businesses are recommended to implement segmented marketing approaches that consider income disparities, while policymakers should craft flexible regulations that accommodate the varying needs of different income groups. Furthermore, consumer education initiatives are proposed to bridge gaps in attitudes and empower consumers with informed decision-making. Continuous monitoring of consumer attitudes is emphasized, urging businesses and policymakers to stay attuned to evolving demographic trends. This study contributes to a deeper understanding of the intricate interplay between demographic factors and consumer attitudes, providing valuable insights for shaping effective marketing campaigns, policies, and consumer-centric initiatives in a dynamic marketplace.

Keywords: Consumer Attitudes, Marketing Mix, Demographic Analysis, Income Disparities, Consumerism, Government Regulations

1. INTRODUCTION

Because of the accessibility of an enormous choice of items and an extensive variety of brand choices inside every classification of items, the Indian business area has been progressively focused all through the purchaser progression period. Indian consumers have shown to be staggeringly demanding and discerning in their buying choices over the course of

time. Because of expanded rivalry among business focuses and purchaser progress throughout the course of recent many years, sponsors have started to understand the current and forthcoming displaying designs that depend on conventional marketing rehearses.

Businesses presently need to understand the idea of "marketing," whose application is known as "market direction," and change their business techniques appropriately. In any case, picking a displaying thought requires that businesses learn the necessities and needs of their customers ahead of time and foster strategies and frameworks that are equipped for addressing those necessities and needs more effectively and productively than contenders, giving customers more noteworthy fulfillment. For publicists to take part in effective exhibiting, they should understand purchaser points of view in regards to the marketing structure in which purchasers are intrigued as well as data about consumers' fulfillment from collaborations with promoters during the use cycle.

1.1.Consumer Perceptions of Marketing

(Bhakane, 2015) recommended that the four key measurements of exhibiting — the thing headway and detect — can be utilized to analyze customers' perspectives towards showing. Examiners have recently endeavored to decide consumer perspectives towards advertising utilizing the four essential measurements of displaying organization: thing, worth, headway, and spot, as well as the general significance of these elements to consumers in contrast with different segment factors. Because of the impacts of globalization and expanded rivalry in the business area, consumers all around the world are currently practicing their imagination and abilities while making acquisition of labor and products, becoming mindful of their legitimate freedoms, standing in opposition to abuse, and looking for solutions for their grievances. The public authority has likewise set up specific regulations to safeguard consumers' fervor. While safeguarding consumers' freedoms and interests has been the essential objective of consumerism, purchaser obligations that accompany these privileges likewise should be considered.

1.2.Customer Government assistance

ISBN - 978-93-95060-79-0

The fulfillment of an individual as a consumer during the usage cycle is known as buyer success. Six distinct kinds of customer satisfaction are referenced. These sorts of satisfaction connect with getting merchandise at a retail store (getting), collecting and characterizing the thing prepared for use (game plan), using customer items and administrations (using), being the proprietor or keeping up with the thing (ownership), being associated with the conveniences accessible in the business community to have the things fixed by the executives providers and handling things by the actual proprietor (support), and being worried about abandoning the thing after use as waste (move). Purchaser life cycle alludes to the usage interaction that incorporates the six phases referenced above: shopping/purchase, preparation/get-together, use/use, proprietorship/ownership, fix/upkeep, and move. Appropriately, what influences consumer flourishing is the fulfillment or disappointment that purchasers experience during the six phases, which incorporate the securing and move of bought labor and products (Sirgy et al., 2008).

1.3.Life Satisfaction

The idea of life satisfaction falls under the classification of individual joy, and consumer behaviorists have observed it also. How much an individual can confirm their general degree of individual delight is a proportion of life satisfaction. It could be said, it alludes to the degree to which an individual distinctions the existence that has been driven by them. Regardless, (Bin-Nashwan, et. al, 2017) contended that encounters of fulfillment or disappointment across a few spaces of life, including as work, family, social, profound, recreation, and so forward, contribute in proposing and representing life's satisfaction. Likewise, life satisfaction is a more extensive idea that incorporates both use and non-use satisfaction.

Just a small number of studies have inspected the connection between factors like work status and enlightening accomplishment and life satisfaction.

Specialists play emphasized the part that consumer perspectives play in supporting and deciding consumer success and the degree of satisfaction that consumers experience in life in general (Peterson and Ekici, 2007). In their examination, (Peterson and Ekici, 2007) proposed that

ISBN - 978-93-95060-79-0

there is a reasonable connection between's the purchaser's mentalities towards advancement and life satisfaction, or personal satisfaction. Moreover, they have recognized that a piece of customer demeanor estimates about displaying are related with the obtaining period of purchaser thriving. Nearly, (Lee et al. 2002) contended that buyers' opinions of fulfillment and disappointment during the pattern of purpose affected the existence satisfaction of customers. Also, the purchaser's point of interaction with the notice during the utilization cycle influences different everyday issues, like prosperity, work, family, social, unwinding, significant, and cash, among others, showing that advancement impacts life satisfaction through different everyday issues. To lay it out plainly, it implies that the purchaser's fulfillment with different parts of their lives and the usage cycle both impact their degree of satisfaction with life.

2. RESEARCH OBJECTIVES

The study endeavors to satisfy the accompanying destinations:

- To study customers states of mind towards advertising blend components i.e., item, value, spot and advancement, general showcasing and working theory of business firms.
- To look at the shoppers states of mind towards consumerism, government controls and purchaser obligations

3. LITERATURE REVIEW

This section looks to show a reasonable system and writing survey of different studies attempted previously.

2.1 Consumer Perceptions of Marketing

The investigators' ridiculous energy for customer acknowledgments towards advancement was ignited by impacting exhibiting exercises and expanding consumerism. Experts fostered the "Consumer Purchasing Con Cash Supply" and "Record of Consumer Certainty File" scales over the course of time to quantify purchasers' perceptions of advancement. As per **(Jain and Goel, 2011),** these instruments' essential imperfection was that they weren't obviously connected with appearing.

The essential measure was created by **(Angamuthu, 2015)** and is related with the accompanying seven advancing regions: judiciousness of business, thing quality, publicizing, cost and worth control,

ISBN - 978-93-95060-79-0

government bearings, customer commitments, and consumerism. By altering a similar scale made.

3.1. Aftereffects of Past Exploration on Consumer Perspectives and Related Issues

Different examinations have been directed in the past to assess consumer perceptions of advancement and related concerns, like unofficial laws, consumerism, and buyers' own obligations, utilizing the scales referenced in the former area (Long & Khalafinezhad, 2012). The segments that follow give an outline of the significant discoveries from these examinations.

3.1.1. Overall Disposition of Consumers Towards Marketing and Business Firms' Working Way of thinking

Utilizing the actions suggested in the primary piece, a few examinations have been led in the US and different countries to decide client perspectives towards displaying, consumerism, and legislative guidelines. A critical piece of the exploration shows that buyers have ominous suspicions about advancing. A couple of exploration **(Jain and Goel, 2011)** uncover generally incredible evaluations towards advancement. The first is a survey of past examination assessing customers' general perceptions of imprint tasks.

Utilizing a five-thing Likert scale and a cross country mail test review, **(Laksmana, et. al, 2018)** directed examinations in the US to figure out clients' overall mentalities towards advertising. In this manner, **(Emaluta, & Soewarno, 2019)** completed an extra examination that recognized the countries of procurement (Israel, the US, Canada, England, Australia, and Norway). **(Amir, et. al, 2014)** embraced an exhaustive examination of purchaser opinions in the US and England. Clients showed ominous mentalities about creating rehearses in every one of these preliminaries.

As per **(Amir, et. al, 2014),** Indian consumers assess progression more precisely than those in Bangladesh, Hong Kong, Australia, the US, and China.

Looking at the connection between the pessimistic parts of advertising and monetary headway at a critical scale, it has been found that consumers' mentalities towards exhibiting are more dicey in additional determined countries since

ISBN - 978-93-95060-79-0

individuals' cravings for higher pay levels make them more confounded by the advertising framework. Anyway, further examination is expected to assess this proposition.

3.1.2. Perspectives on General society on the Marketing Blend

The way that consumers view advertising is one part of the marketing blend. Subsequently, an endeavor has been made in the accompanying subsections to give a rundown of the examination led in the past to decide the perspectives of consumers towards the four parts of displaying — thing, worth, scattering, and commercial.

3.2.Consumers' Perspectives on the Item

Consumerists have long contended that the counter-intuitive split of organization areas and misleading thing partition are the purposes behind customers' disappointment with over the top advertising. It has been contended that further discontinuity of the business area is accomplished by means of thing partition in light of little contrasts. To urge consumers to see contrasts in quality, the expenses of isolated items are set in a manner that addresses more assortment in thing quality than really exists (**Hayati, & Al Muddatstsir, 2019, October).**

As indicated by **(Nikou, et. al, 2016)** Electroni, customers battle with the thing part of the displaying blend with regards to deliberate maturing, thing increase, security, the thing's worth to purchasers, and checking. It has been resolved that thing increase is an upscaling of the item offering, giving barely perceptible novel things at essentially greater costs.

Albeit most of customers accepted that makers really tried to create products that addressed their issues, they have likewise communicated surprising disappointment with issues connected with the nature of the merchandise, for example, the way that there hasn't been any improvement to the nature of the products over the long haul, that the products break down rapidly, and that producers purposefully downplay enhancements.

3.3.Consumers' Perceptions of Conveyance

Earlier examination has shown that consumers have commonly sure assessments on the convenience and

ISBN - 978-93-95060-79-0

availability of items. As per research led by **(Salah, et. al, 2019),** consumer shopping was basically demonstrated to be sure. Thus, buyers from various nations give off an impression of being very happy with the conveyance framework.

3.3.1. What Segment Elements Mean for Consumer Perceptions of Marketing

Tracking down proof of the parts responsible for the consumer demeanors towards advancing has been a center area of examination for investigators across all nations and locales of the world. Researchers have really tried to understand what segment factors mean for consumers' perspectives towards advertising, as will be talked about underneath:

3.4.Consumer Perceptions by Orientation

Concentrates on by (Iriqat, et. al, 2017) found that ladies had more adversarial mentalities towards showing than did guys. Regardless, found that the inverse is valid. Contrasted with ladies, men are less responsive to advancements and one of the conceivable clarifications set forth by them is that men are practically more keen on buying showy products; furthermore, (Saputra, 2019, March) recommend that silly buys will probably cause post-buy friction.

(Abekah-Nkrumah, et. al, 2021) likewise noticed that men were more probable than ladies to have rash sentiments that caused them to try not to assume liability. As indicated by **(Ferdous and Towfique's 2008)** research, ladies were more negative about advertising sharpens than men were. They had likewise seen some striking distinctions in sexual orientation regarding advertising and shopping; that is, female respondents' mentalities towards these exercises were more negative than those of their male partners.

3.5.Consumer Perceptions by Age

The more prepared customers displayed better mentalities towards thing, evaluating, and advancement, as indicated by research by **(Kirmaci, 2012).** More youthful respondents discussed the consistency of advanced products and the precision of the photographs in advertisements, while additional accomplished respondents communicated more noteworthy trust in the forceful structure and the advantages of exposure **(Shaon, & Rahman, 2015).**

ISBN - 978-93-95060-79-0

Most of youthful respondents are disappointed with the means taken to control customer fights **(Andotra, & Abrol, 2016).** Appropriately, more youthful individuals had more regrettable perspectives on advancement and its numerous components. In any case, **(Kurniati, et. al, 2015)** study's discoveries uncovered no tremendous contrasts between the age bunches regarding generally speaking perceptions of advertising and explicit mentalities for specific parts of advancement.

3.6.Consumer Perceptions In regards to education

Research directed by **(Sulaiman, 2020)** uncovered areas of strength for a between respondents' uplifting outlooks towards advertising and the degree of educational accomplishment they accomplished. In any case, **(Siddiqi, et. al, 2018)** couldn't find any massive contrasts between advertising inclines and various degrees of educational achievement.

4. RESEARCH METHODOLOGY

4.1.Research Design and Instrument

In pursuit of testing the theoretical framework previously established, an experimental study was undertaken. This section elucidates the research design and methodology adopted for the study. Specific focus is given to the research instrument, data sources, and the sampling design.

4.1.1. Research Instrument Description

A survey instrument was meticulously designed to collect attitudinal data regarding consumer perspectives on marketing mix, consumer well-being, life satisfaction, and opinions on business firms' operating philosophies, consumerism, government regulations, and consumer responsibilities. The structured, non-disguised questionnaire was developed based on existing literature and tailored for the Indian context. It encompassed items related to consumer demographics (marital status, income, occupation, education, age, and gender), attitudes toward marketing, significance of marketing mix elements, consumer well-being, life satisfaction, attitudes toward government regulations, consumerism, and consumer responsibilities.

ISBN - 978-93-95060-79-0

To capture the attitudes of rural consumers, the survey was translated into Hindi. The translation was back-translated to rectify any disparities between the two versions. The study employed various scales to measure consumer attitudes, including the Gaski 28-item scale and Etzel's Consumer Sentiment toward Marketing (CSM) to gauge marketing attitudes.

4.1.2. Measurement of Consumer Attitudes toward Marketing

Because of the Consumer Sentiment towards Marketing (CSM)'s proven validity and dependability, it was selected. Four elements make up the scale: product, pricing, distribution (represented by retail service), and promotion (particularly advertising). Each component is assessed using a multi-item Likert scale. The weighted scores of the four sub-scales were added together to determine the total consumer sentiment score..

4.1.3. Measurement of Consumer Well-Being

Consumer well-being was measured using a scale proposed by Sirgy et al. (2008). This scale considers six types of consumer experiences: acquisition, preparation, possession, consumption, maintenance, and disposition. Items measuring satisfaction across these dimensions were used to assess consumer well-being.

4.1.4. Measurement of Satisfaction with Life

Life satisfaction was measured using Diener et al.'s SWLS (1985). The SWLS measures respondents' agreement or disagreement with five propositions from -2 to 2...

4.2.Data Sources and Sample Design

4.2.1. Data Sources

This research utilized both primary and secondary data sources. The theoretical framework was developed based on a thorough analysis of secondary sources, including academic journals such as the Journal of International Consumer Marketing, Journal of Marketing Research, and European Journal of Marketing.

4.2.2. Sample Design

A survey was conducted among Indian consumers from Maharashtra State and neighbouring towns near Mumbai, Maharashtra between February and April 2023. Convenience sampling

ISBN - 978-93-95060-79-0

was employed, distributing 100 surveys to respondents in homes, offices, and institutions. After repeated efforts, 100 completed surveys were collected and used for analysis.

4.3.Data Analysis Techniques and Scale Reliability

Calculating means and standard deviations was a necessary step in the data analysis process to evaluate customer sentiment. One-way analysis of variance, significant difference tests, and independent samples t-tests were used to compare the means across the various demographic categories. Bivariate correlation was employed to investigate the relationships between the variables.

The collected data were coded and then imported into the SPSS 16.0 software for analysis. The reliability of the multi-item scales was assessed using the Cronbach's alpha coefficient, which yielded results indicating strong reliability, with values ranging from 0.912 to 0.981.

.

5. DATA ANALYSIS AND INTREPRETATION

An overview of the survey respondents' demographic details, including age, gender, employment, income, marital status, and level of education, is given in Table 1. Remarkably, most participants are unmarried, and a sizable fraction have a bachelor's degree and are in the middle wage range.

Table 1: Demographic Characteristics of Survey Participants

Demographic Variable	Frequency	Percentage (%)
Marital Status		
- Single	70	70%
- Married	30	30%
Income		
- Low (Rs 30,000)	35	35%
- Moderate (Rs 30,000- Rs 60,000)	45	45%
- High (Rs 60,000-Rs 100,000)	15	15%
- Very High (>Rs100,000)	5	5%
Occupation		

ISBN - 978-93-95060-79-0

- Professional	25	25%
- Managerial	40	40%
- Skilled Labor	25	25%
- Unskilled Labor	1	10%
Education		
- High School	24	24%
- College	30	30%
- Bachelor's Degree	40	40%
- Master's Degree	5	5%
- Doctorate	1	1%
Age		
- 18-24	25	25%
- 25-34	40	40%
- 35-44	20	20%
- 45-54	10	10%
- 55 and above	5	5%
Gender		
- Male	70	70%
- Female	30	30%

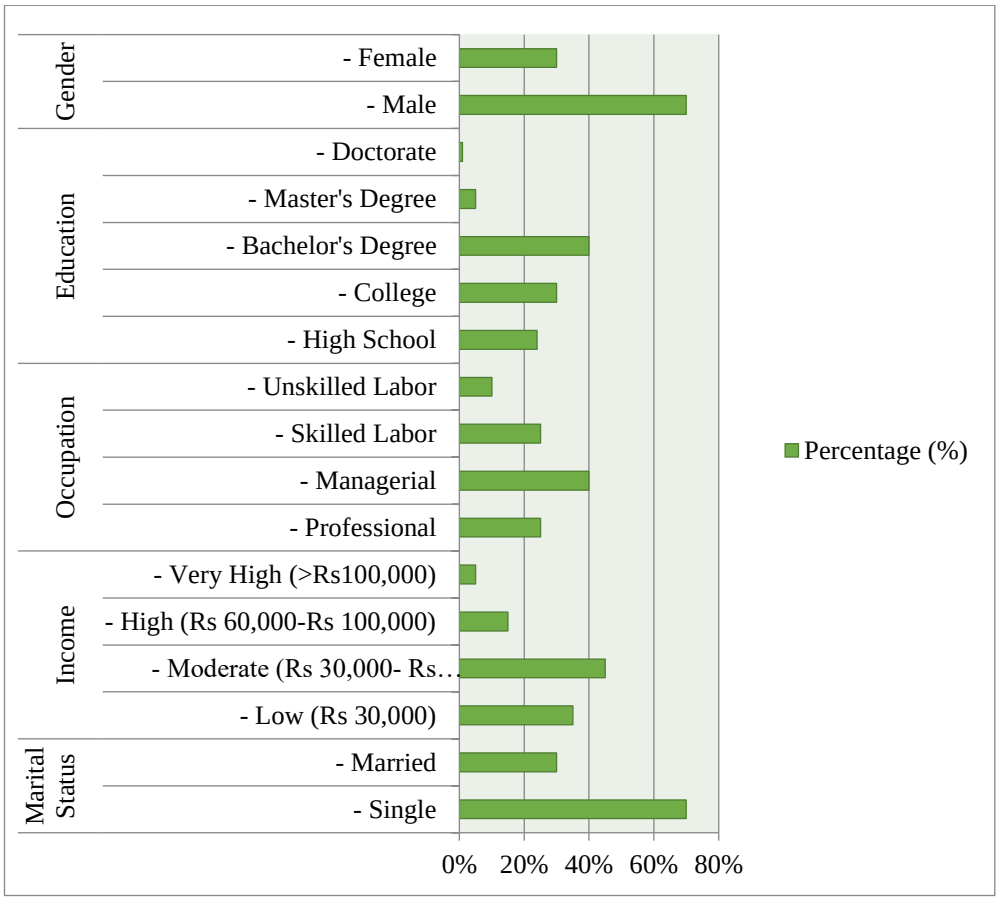

Figure 1: Demographic Characteristics of Survey Participants

ISBN - 978-93-95060-79-0

Table 1 provides a comprehensive summary of the segment nuances that the overview respondents remembered, including information on age, orientation, marital status, income, employment, and education.

The majority of participants, or around 70% of the focused population, are single, with the remaining 30% of responses being married. According to the members' pay appropriation, there are four pay categories: low-pay (under Rs 30,000), decent-pay (between Rs 30,000 and Rs 60,000), top-level (between Rs 60,000 and Rs 100,000), and very big-time (>Rs 100,000) for 5% of the members. A broad range of professions are covered by survey participants: 25% are categorised as experts, 40% as chiefs, 25% as talented job, and 10% as untalented labour. The following is a breakdown of members' instructional backgrounds: Of the respondents, 24% have completed secondary education, 30% have attended college, 40% possess a four-year certification, 5% hold a graduate degree, and 1% hold a PhD. The members' ages vary widely: 25% are between the ages of 18 and 24, 40% are between 25 and 34, 20% are between 35 and 44, 10% are between 45 and 54, and 5% are beyond the age of 55. There is a balanced combination of orientations, with 70% of the members being men and 30% being women.

Table 2: Consumer Attitudes and Beliefs

Attitudinal Variable	**Mean Score**	**Standard Deviation**
Consumer Sentiment toward Marketing		
- Product	3.02	0.936
- Price	3.02	0.963
- Place	3.04	1.022
- Promotion	3.06	1.085
- Overall Marketing	3.09	1.066
- Business Operating Philosophy	4.02	1.063
Attitudes toward Consumerism	3.93	0.956
Attitudes toward Government Regulations	4.02	0.945
Attitudes toward Consumer Responsibilities	3.96	1.023

In terms of consumer sentiment toward marketing, participants expressed moderately positive attitudes across different elements. Specifically, the mean scores for product, price, place, and promotion range from 3.02 to 3.06, indicating a generally favorable outlook. The overall marketing sentiment, with a mean score of 3.09, continues to reflect a positive attitude among

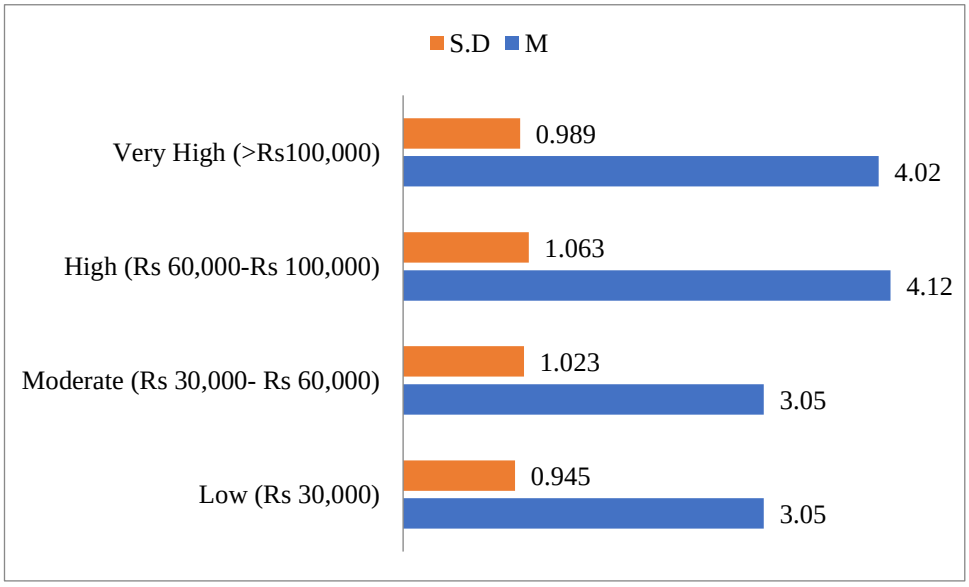
ISBN - 978-93-95060-79-0

participants. Notably, the business operating philosophy receives a higher mean score of 4.02, suggesting a more favorable perception regarding the overarching approach of businesses.

The attitudes toward consumerism exhibit a mean score of 3.93, indicating a moderately positive stance among participants. This suggests that, on average, respondents view consumerism in a favorable light. Similarly, attitudes toward government regulations receive a mean score of 4.02, indicating a positive perception of the role of government regulations in the consumer landscape. Additionally, attitudes toward consumer responsibilities have a mean score of 3.96, reflecting a generally positive view of the responsibilities consumers bear in the marketplace.

Table 3: Comparison of Consumer Attitudes Based on Income

Comparison	M	S.D	t-statistic	p-value
- Low (Rs 30,000)	3.05	0.945	-0.361	0.015
- Moderate (Rs 30,000- Rs 60,000)	3.05	1.023	0.631	0.02
- High (Rs 60,000-Rs 100,000)	4.12	1.063	0.956	0.03
- Very High (>Rs100,000)	4.02	0.989	0.812	0.01



ISBN - 978-93-95060-79-0

Figure 2: Comparison of Consumer Attitudes Based on Income

Captivating patterns might be found in the mean scores for each level of pay. The run of the mill score for those with unobtrusive livelihoods (not as much as Rs 30,000) is 3.05, which proposes a somewhat hopeful viewpoint. This suggests that even notwithstanding monetary hardships, individuals in this pay range have a regularly uplifting outlook on the consumer mentalities that have been estimated. In any case, when contrasted with other pay gatherings, the pessimistic t-measurement of - 0.361 and the comparing p-worth of 0.015 show a measurably huge distinction, recommending that individuals in this level of pay have fundamentally various suppositions from individuals in other pay classifications. While contrasting the moderate-pay bunch (Rs 30,000 - Rs 60,000) to the next, the mean score stays at 3.05, demonstrating that consumer sees are still commonly sure. When contrasted with the low-pay bunch, there is a distinction in mean scores, however it isn't genuinely huge, as per the t-measurement of 0.631 and the p-worth of 0.02.

The top level salary class (Rs 60,000 - Rs 100,000) then again, has a lot higher mean score of 4.12, proposing a more hopeful demeanor among consumers. In contrast with the low-pay bunch, this distinction seems, by all accounts, to be genuinely critical, as demonstrated by the t-measurement of 0.956 and the p-worth of 0.03. This recommends that the people who bring in more cash regularly see the elements under appraisal all the more well. Likewise, the incredibly big league salary class (>Rs 100,000) displays a mean score of 4.02, showing a decent customer feeling. When contrasted with the low-pay bunch, this gathering's viewpoints vary significantly, as shown by the t-measurement of 0.812 and the p-worth of 0.01.

6. CONCLUSION AND RECOMMENDATION

This study, which looked at a number of variables like income, marital status, occupation, education, age, and gender, has given important insights into the attitudes and opinions of the examined population towards consumers. Based on the demographic study, a full insight of the consumer landscape was possible due to the broad and representative sample. Nuanced insights into the attitudes and beliefs influencing consumer behaviour were also revealed by analysing consumer attitudes towards marketing, consumerism, laws, and consumer duties. Significant differences in consumer views were found by the income-based research, with

ISBN - 978-93-95060-79-0

higher income levels being linked to more favourable feelings. Businesses looking to customise their marketing plans and policies to successfully target various market income categories will find this knowledge invaluable. The study also emphasised how crucial it is to take demographics into account when creating marketing strategies and legal frameworks since these elements have a big impact on customer perceptions.

Recommendations:

Based on the findings of this study, several recommendations can be made:

- Segmented Marketing Strategies: Businesses should consider implementing segmented marketing strategies that take into account the income levels of their target audience. Tailoring marketing messages and approaches to specific income segments can enhance the effectiveness of campaigns.
- Policy Considerations: Policymakers should be cognizant of the diverse consumer landscape and the impact of income on attitudes. Regulatory frameworks should be flexible enough to accommodate the varying needs and perspectives of different income groups.
- Consumer Education Initiatives: Initiatives aimed at consumer education can help bridge the gap in attitudes across different income levels. Educating consumers about their rights, responsibilities, and the benefits of certain products or services can contribute to more informed and positive attitudes.
- Continuous Monitoring: Businesses and policymakers should engage in continuous monitoring of consumer attitudes, taking into account evolving demographic trends. Regular surveys and assessments can provide real-time insights, enabling timely adjustments to marketing strategies and policies.

ABSTRACT

This research looks into the business and social situations of Micro, Small, and Medium Enterprises (MSME) owners in Maharashtra, India. The study looks into where fixed and working capital come from, how they affect financial problems, and how government policies affect the world of business. The study looks at a lot of different fields, such as professional services, industry, retail, and oil mining and production. In order to gather data, an organized

ISBN - 978-93-95060-79-0

form is sent out through field surveys, and secondary data from reliable sources is also used. The study shows that businesses are different based on their gender and educational background. The production and mining sectors are the most financially viable. Personal savings and bank loans play a big role, which highlights the need for specific measures to deal with problems, especially the lack of access to credit. The results give us useful information that will help policymakers make smart choices about how to support Maharashtra's diverse MSME environment. This will encourage adaptability and new ideas that will lead to long-term economic growth.

1. INTRODUCTION

Miniature, little, and medium-sized organizations (MSMBs) are the essential motor of worldwide financial development. There is extraordinary worth in the job that SMEs play in aiding the Indian economy develop and thrive. Little and medium-sized undertakings (SMEs) in India currently utilize very nearly 10 million individuals every year, making them the nation's second-biggest business and a significant driver of fair provincial improvement after farming. The way that SMEs are answerable for over 90% of all assembling in India, 45% of modern result, 40% of commodities, and 17% of Gross domestic product shows that they are the foundation of the Indian economy. These organizations assume a urgent part in India's monetary development as helper units to the country's bigger production lines. In any case, the job that MSMEs have played in the development of the Indian economy is remarkable. Little and medium-sized undertakings (SME) in India are progressively compromised by the monetary slump, an absence of interest, subsidizing, and rivalry from worldwide organizations (MNCs). Subsequently, in the ongoing work, we look to pinpoint the issues tormenting the supporting of miniature, little, and medium-sized endeavors (MSMEs).

Miniature, Little, and Medium Undertakings not just assume a pivotal part in giving enormous work valuable open doors at similarly less capital expense than huge scope enterprises, however it likewise helps in the industrialization of provincial and in reverse regions, subsequently, decreasing territorial irregular characteristics, guaranteeing more impartial portion of public pay and riches. Miniature, little, and medium-sized endeavors (MSMEs) act as helper units to enormous scope organizations and fundamentally add to public financial turn of events. The KVI, or Khadi and Town Ventures, are two of India's broadly huge customary financial areas. KVI's capacity to produce occupations with a little effect on the country's Gross domestic product per capita is a significant draw. The KVI business not just fulfills the crucial requirements of handled merchandise of the tremendous provincial area of the nation yet additionally gives supported work to country specialists. There is likewise a sizable coir business in these SSIs.

1.1. Financing issues of MSMEs in India

Most owners of micro, small, and medium-sized enterprises (MSME) lack the money necessary to set up and maintain their businesses, despite the fact that all industries require resources to meet their fixed and variable expenses. They have no choice except to resort to borrowing. The size of the company has a significant impact on its reliance on debt for investment purposes. Micro firms depend on debt as a key source for both early and development stage whereas small and services largely handle in cash and tend to retain insignificant records. Due to the longer working capital cycle and higher capital costs, businesses in manufacturing and the services sector often have a greater requirement for access to cash. However, most businesses do not rely on banks as their major source of financing since the application procedure is too time-consuming and cumbersome. They can't get loans since they don't have enough of a credit history or collateral to secure one. The Industrial Finance Corporation (IFC) reports that 95 percent of all financing comes from the informal sector, which includes people's personal networks (such as friends and family). Trade credit, chit funds, and moneylenders are all examples of expensive institutional channels that

ISBN - 978-93-95060-79-0

charge interest rates between 25% and 60% per year. Therefore, there is typically a debt gap that serves as a significant impediment to the establishment and operation of MSMEs. When it comes to micro, small, and medium-sized enterprises (MSMEs), several institutions have been established by federal and state governments as well as financial institutions to aid in the growth of this important economic sector.

1.2. Financial funding to MSMEs

Internal and external financing options exist for micro, small, and medium-sized enterprises. Funding from within the company is referred to as "internal sources:

(i) **Retained Earnings** - A portion of the industry's net gain from a prosperous trading year might be put towards funding subsequent endeavours. Assuming the company is making money, this might be a crucial source of long-term financing.

(ii) The sale of the company's assets (land, buildings, furniture, fixtures, equipment, cars, etc.) can be used to fund new ventures or settle existing obligations. Selling an automobile to pay off debts is an example of a short-term usage of this method, but the sale of more valuable assets (such as real estate) might provide a more permanent source of funding.

1.3.Institutional Support to MSMEs in India

Small and medium-sized enterprises (MSMEs) are a growing and vital part of India's manufacturing industry. Year after year, this industry has demonstrated impressive development in terms of output, the number of jobs created, and the amount of goods exported. The contribution of MSMEs to industrial growth and economic development of the country has been extremely crucial. Accessing technology and being competitive have proven particularly challenging for MSMEs. Institutional aid is needed to address issues including unfamiliarity with new possibilities, difficulty to access them, and a lack of growth capital. Organisation for the Development of Small Enterprises (SIDO): For the purpose of fostering the growth of a wide variety of micro- and small-scale enterprises, a Small Industries Development Organisation has been established. SIDO works under the umbrella of the SSIs and ARI Department. The State Implementation and

ISBN - 978-93-95060-79-0

Dissemination Office (SIDO) is responsible for centrally coordinating and monitoring all SSI-related policies and initiatives. SIDO offers a variety of services, including training, consulting, requirements assessment for SSIs, and the creation of industrial estates. A total of 27 offices, 31 SISI (Small Industries Service Institute) extension centres, and 7 manufacturing and process development centres handle all of these tasks.

2. LITERATURE REVIEW

Dhale et al., (2015) Little and medium-sized endeavors (SME) are the foundation of any nation's economy, as the creator of a review named "Basic Examination of Pretended by Monetary Organizations Being developed of Indian Msme's" makes sense of. Around 10 million individuals in India are working for MSMEs. After farming, the miniature, little, and medium-sized endeavor area is India's biggest manager. 90% of absolute enterprises in the economy are in Indian MSMEs. Around 45% of this 90% goes into assembling, 40% into trades, and 17% into Gross domestic product. Supporting assumes a fundamental part in the drawn out progress of MSMEs in the modern area. India's administration and monetary establishments assume urgent parts in the nation's advancement. Numerous little and medium-sized undertakings (MSMEs) all through the world wouldn't exist without the help of monetary foundations, which this article has featured. Improved results might be normal from a more noteworthy interest in miniature, little, and medium-sized undertakings (MSMEs), which is examined and assessed in this review.

Garg (2015) Discoveries from the examination "Evaluation of Little and Medium Ventures Development in the Punjab Territory of India" found that advancement of the MSME area can possibly widen the province of Punjab's economy. In Punjab, the miniature, little, and medium-sized undertaking (MSME) area depends vigorously on ICT. Affiliations ought to put resources into this field of Data and Correspondence Innovation for the improvement of creation limit of this industry. This market fragment is significant on account of the positions and cash it makes. The miniature, little, and medium-sized endeavor (MSME) area can speak with the worldwide partnerships. Enhancements to the MSME area in actual conveniences including rail routes, streets,

ISBN - 978-93-95060-79-0

power, and water supply are likewise proposed in this review.

Puneet et al., (2015) as per "Elements Impacting the Data Innovation Reception in Miniature, Little, and Medium Ventures (MSMEs): an Exact Review" The miniature, little, and medium-sized undertaking area in India is essential. Fabricating creation, trades, occupations, venture, and new advances are totally helped by this industry. The commitment of MSMEs to Gross domestic product was 17% in 2011, and it rose to 22% in 2012. Because of globalization, this industry has needed to manage various new challenges. Insufficient mastery, an absence of suitable innovation, wasteful showcasing foundation, limits on development and modernization, and a deficiency of qualified work are only a portion of the issues keeping the business down. These difficulties might be managed out through IT, foundation and preparing for the development of faculty. In this article, we investigated the utilization of innovation in North Indian MSMEs. This article contends, in view of experimental exploration, that administration guidelines, extraordinary competition, and data imparting to clients all assume a part in driving far reaching utilization of data innovation.

Biswas (2014) He contended in his article named "Supporting Requirements for MSME Area" that MSMEs are urgent to the outcome of our country. The Public authority of India and the Hold Bank of India have ordered various measures all through the years to expand the accessibility of credit for little and medium-sized ventures (MSMEs). The banks will advance cash to the need area without requiring any insurance. It is reasonable to expect that there are a few difficulties for miniature, little, and medium-sized ventures (MSMEs) in accessing bank credits and different types of funding. Regardless of the public authority's earnest attempts to work with the progression of credit to the MSME area, there is still a lot to be finished before the area's genuine supporting requirements can be met.

Biswas (2014) While loaning cash to little and medium-sized organizations (SMBs), banks have run into various issues. These miniature, little, and medium-sized endeavors (MSMEs) work generally in the casual economy, where they need formal

ISBN - 978-93-95060-79-0

fiscal reports. Banks won't stretch out credits to SMEs on the off chance that a strong monetary record doesn't as of now exist. One more issue for M&E is the failure to give security while expanding credit. because of the bigger amount of advances became nonperforming before, the historical backdrop of the financial business with MSMEs. The hole between the requirement for credit in this industry and how much credit made accessible by banks and other monetary establishments is gigantic.

Singh et al., (2013) The article "Innovation Development Issues Influencing Little Firms Execution" makes sense of the essential job that MSMEs play in monetary development and occupation creation in arising countries. This industry is essential to India's monetary improvement since it lessens local incongruities and guarantee all the more equally disseminated riches and pay the nation over. Around 8% of Gross domestic product, 45% of modern creation, and 40 percent of commodities come from this industry. This record likewise subtleties how the organization has battled with an absence of subsidizing since it previously opened its entryways. To stay serious in the worldwide market and fulfill the needs of their purchasers, the creators of this study contend that organizations ought to put resources into mechanical motivating forces. Concurring on the aftereffects of this examination, the public authority has executed projects to assist with things like monetary administration, innovation collaboration, and representative strengthening.

Deshpande & Sharma (2013) Business venture or Endurance?," a review paper he composed. Examination of unit-level information from the enlisted fabricating area of the miniature, little, and medium endeavors enumeration information was utilized in the review named "Position and Orientation of Private company in India," which looked to make sense of the support of dalits and other minimized gatherings and ladies in the miniature, little, and medium ventures area. Organizations possessed by individuals from the SC and ST people group are excessively packed in country regions.

3. RESEARCH METHODOLOGY

ISBN - 978-93-95060-79-0

The theories that will be tested have been stated previously. The analysis of the collected data was guided by the z-test, frequency, and percentage measures. Moreover, the study was grounded on a review of related literature that provided a foundation of support. Most of these variables have been researched extensively. This section's goal is to detail the procedures that were followed during this study's research phase. Study design, sample selection, data collecting strategies, and data processing techniques are all covered here.

3.1.Objectives of the Study

1. To Investigate the socio-economic and business standing of entrepreneurs in Maharashtra.
2. To Explore the origins of fixed and working capital for enterprises in Maharashtra.
3. To Assess financial challenges within businesses in Maharashtra.
4. To Analyze the impact of government policies and support programs on the entrepreneurial landscape in Maharashtra.

3.2. Study Area

This study broadly examines MSMEs' funding in Maharashtra. This survey covers all MSMEs in eleven categories. The 10 options reflect different business sectors. This analysis assumes professional, consumer, guest, manufacturing, transportation, public utilities, retail, wholesale, agricultural, agriculture-related, construction, and oil mining/extraction businesses in Maharashtra. These eight settings represent a broad sample of Maharashtra MSMEs from different industries. This technique helps collect data in a specific geographic region and groups MSME firms in Maharashtra.

3.3. Data Collection

3.3.1. Secondary Data

In addition, this study employed legitimate secondary data. MSME yearly reports and government and agency surveys enhance primary data.

3.3.2. Procedure

This research collected data on its aims using a standardised questionnaire.

ISBN - 978-93-95060-79-0

3.3.3. Data Gathering Plan

Data was collected by field survey. A structured questionnaire was given to respondents in each setting who agreed to respond, asking about their entrepreneur-started business, gender, types of businesses, qualification, financing problems, financing sources, investment in manufacturing, investment in services, scope for modernization, sickness in firms, etc. Before distribution, entrepreneurs were asked for help. Those who consented to fill out the questionnaire received it. The questionnaire explained the research, its value, and the researcher's assistance. The researcher helped them read the questionnaire to reduce answer error.

4. DATA ANALYSIS AND INTERPRETATION

ISBN - 978-93-95060-79-0

4.1. Demographic Characteristics of MSME Entrepreneurs in Maharashtra

Table 4.1: Demographic data of entrepreneurs

The study shows that MSME business owners in Maharashtra come from a wide range of backgrounds. There are big differences between men and women in the professional, customer, guest services, industrial, transportation, retail, and trade sectors. There are different kinds of financial problems, with industry having the most trouble. However, a variety of funding sources are used, such as bank loans and government funds. Investing in production and services is not the same, and there is room for a lot of change. Sickness is common in companies where women run customer and guest services. The results show that specific help is needed to address the problems and make the most of the possibilities in each industry in Maharashtra to encourage business and long-term economic growth.

4.2. Business performance

Table 4.2: Analysis of business performance

Industry	Average Annual Revenue (INR)	Average Profit Margin (%)
Professional services	1,500,000	15
Consumer services	1,000,000	10
Guest services	800,000	8
Manufacturing	5,000,000	12
Transportation and public utilities	2,000,000	14
Retail	1,200,000	9
Wholesale	1,800,000	11
Agricultural and agricultural-related	600,000	6

ISBN - 978-93-95060-79-0

Construction-related	3,000,000	16
Mining/extraction of oil	10,000,000	20

There are big differences between the businesses in Maharashtra when you look at their average yearly revenue and profit margins. Manufacturing and mining/oil extraction bring in the most money each year, with an average of INR 5,000,000 and INR 10,000,000, respectively. These businesses also have higher profit rates, between 12% and 20%, which shows that they can make money. Agriculture and companies connected to agriculture, on the other hand, make an average of INR 600,000 a year and have a profit margin of 6%, which shows how tough the economy is in this sector. With a big profit margin of 16 percent, the building industry stands out in Maharashtra's business world. This shows that it has the potential to make money.

4.3.Sources of Fixed and Working Capital Table

Table 4.3: Source of capital funds from MSMEs

Source of Capital	Percentage of Total
Personal savings	40
Bank loans	30
Government grants and subsidies	15
Venture capital	10
Other sources	5

ISBN - 978-93-95060-79-0

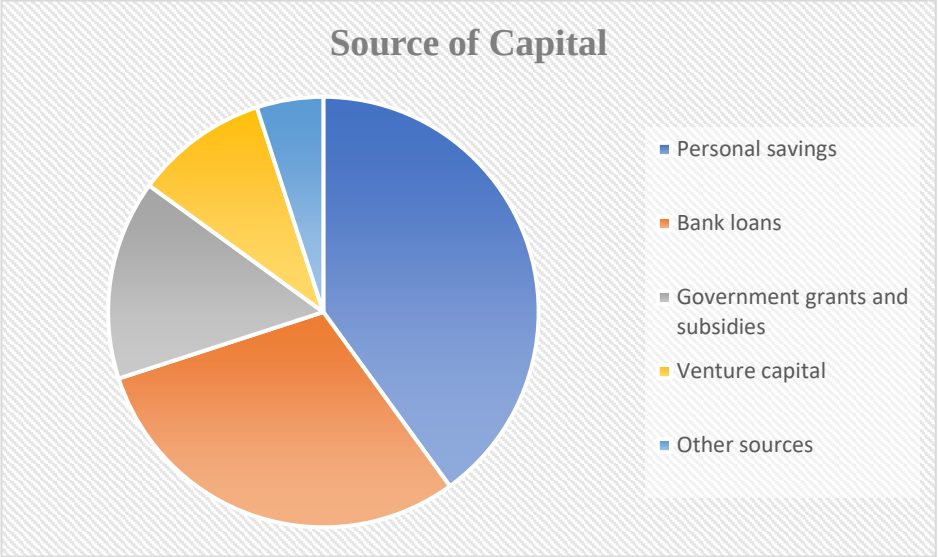

Figure 4.1: Pictorial representation of source of capital funds

Maharashtra relies heavily on personal funds, which make up 40% of all capital, as shown by a study of capital sources. This shows that businesspeople are very committed, which could mean they have faith in their businesses. 30% comes from bank loans, which shows a dependence on outside financing, which is a popular way for businesses to grow. The fact that 15% of the money was set aside for government handouts and subsidies shows how important public backing is for business growth. The fact that venture capital makes up 10% of the market shows that some businesses are getting outside money to grow. The last 5% came from other sources, showing how varied the funding is and how important it is for Maharashtra's business processes and growth to have many ways to get money.

4.4.Financial Challenges Faced by Businesses Table

Table 4.4: Challenges faced by MSMEs

Challenge	**Percentage of Businesses Affected (%)**
Access to credit	50 %
Cash flow management	30 %

ISBN - 978-93-95060-79-0

Debt repayment	20 %
Taxation	15 %
Regulatory compliance	10 %

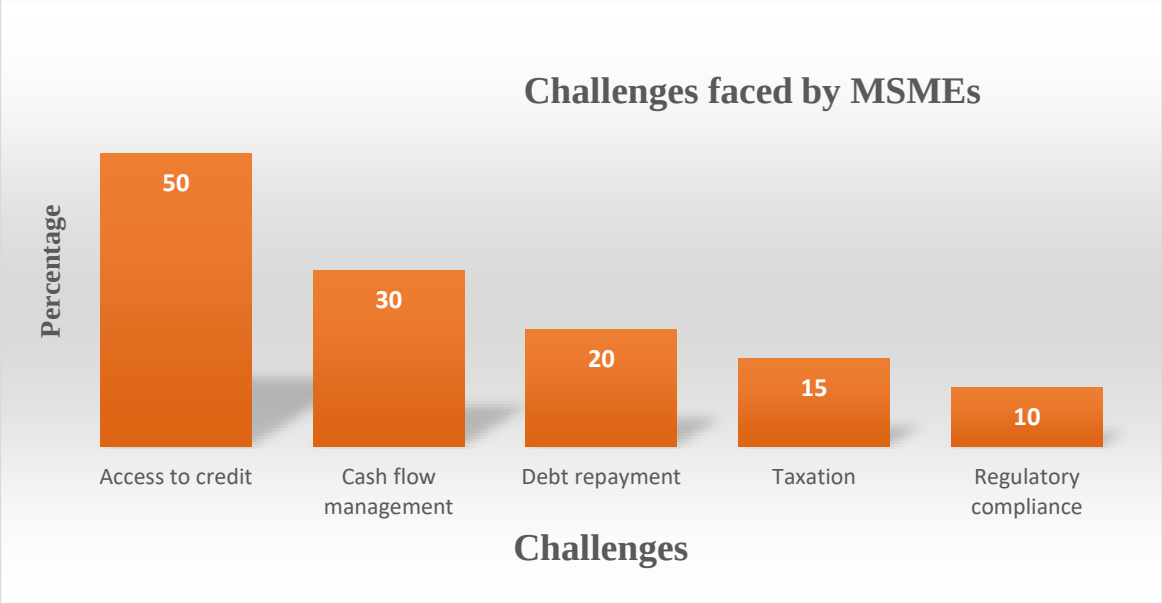

Figure 4.2: Graphical representation of challenges faced by MSMEs in percentage

Access to loans is the biggest problem for companies in Maharashtra, as shown by the fact that it affects half of all businesses. This points to a big problem with getting money, which could stop growth and longevity. Cash flow management comes in at a close second with 30%, showing how important it is to keep cash on hand for day-to-day activities. 20% of businesses have trouble paying their debts, 15% have trouble with taxes, and 10% have trouble following the rules. These problems show how complicated problems can be. For example, limited funds, high taxes, and complicated rules all affect the business world as a whole. Taking care of these problems is necessary to make Maharashtra a good place for business growth and economic progress.

5. RESULTS AND DISCUSSION

ISBN - 978-93-95060-79-0

The study on MSME owners in Maharashtra shows that the world of business is very different, with differences in gender, education, and financial problems between industries. When it comes to business success, the manufacturing and oil mining/extraction sectors stand out. They have the biggest average yearly income and profit margins, which shows that they can make money. Instead, companies that are connected to agriculture and agriculture are having a hard time with the economy, which shows in their lower income and profit margins.

The study of capital sources shows that personal funds and bank loans are used a lot. This shows how committed the entrepreneurs are and how common it is to get outside money to grow a business. Government funds are very important because they make up 15% of the total capital. This shows how important public backing is for business growth. The problems small businesses in Maharashtra are having, especially getting loans, show how important it is to focus interventions to remove financial roadblocks that are stopping businesses from growing. Cash flow management, paying off debt, taxes, and following rules and regulations are also big problems that businesses have to deal with. This shows how complicated business problems are.

6. CONCLUSION

Finally, the in-depth study of MSME businesspeople in Maharashtra has given us useful information about the many changing aspects of being an entrepreneur. The results show that female representation, qualifications, and financial problems are not all the same in different fields. This shows how important it is to have customised support plans. The performance study shows that the manufacturing and oil mining/extraction sectors are very profitable, while farming companies are having a hard time making money.

Capital sources show that a lot of people depend on personal savings and bank loans. This shows how dedicated businesses are and how common it is to get money from outside sources. Grants from the government are very important because they show how public backing for businesses can help them grow. The problems that have been named, especially the general worry about not having enough access to credit, make it clear that specific actions are needed to remove financial obstacles.

This study not only helps us learn more about the MSME sector in Maharashtra, but it also gives us the information we need to make policy choices that will help businesses grow and the economy grow in the long term. Using these findings will help create policies and support

ISBN - 978-93-95060-79-0

programmes that meet the unique needs of different businesses, encouraging resilience and new ideas in Maharashtra's MSME environment.

Ajeenkya D Y Patil University, Pune Vijay.kulkarni@adypu.edu.in

Abstract
It is a never-ending problem and subject of constant idea to comprehend the buying behaviours. However, it is equally necessary to comprehend the depth of the customer's psyche and create the truly necessary exactness in foreseeing the future. Both the buying behaviour and the instruments and processes that facilitate exchanges are significant. As Generation Z progressively develops to represent a sizable piece of the consumer market, it is currently more significant than any time in recent memory to understand how to sell to it. Our understanding of their online shopping behaviour patterns will help us better understand their buying propensities. The accessibility of online stages and technology have essentially affected consumer behaviour, especially that of generation Z. Online shopping is expanding at the fastest rate and quickly becoming a famous and trusted shopping channel of customers all through the world, in which, the customer bunch represents a major share and tends to guide consumer behaviour. Online, generation Z is the present and future. To help businesses continue to reach and prevail upon this set of potential customers, this article focuses on understanding the elements influencing Gen Z's online shopping movement. This study intends to discover some of the online shopping behaviours of Gen Z and likewise attempts to identify some valuable affiliations that will help marketers and other people researching Gen Z movement. The discoveries indicate that Gen Z prefers to lead in-depth research before making an online purchase.

Keywords: Generation Z, E-Commerce, Buying behaviour, Security, Online purchase experience, Online Purchase Intention.

1. INTRODUCTION

Customers may opt to do their shopping online due to the Internet's growing

importance as a global communications and trade platform. According to Internet World Stats (2020), as of April 2020, 59% of the world's population, or roughly 4.57 billion people, were regular Internet users. E-commerce also facilitates the shipping, transporting, purchasing, trading, and two-way communications of goods and services. What's most endearing is that major e-commerce companies are still mostly ignoring a sizable percentage of those prospective customers.

Indian customers are presently undeniably more compatible with online stages than any time in recent memory. Over 150 million people use the internet, and that number is increasing every minute. Both the scale of the e-commerce business and Indian consumers' acceptance of it are exploding. The burgeoning and massive e-commerce sector generates critical measures of revenue through online exchanging. The replies of the users are completely significant to the success of e-commerce. Users are becoming more comfortable making purchases online, and the epidemic has made reception simpler. Modern technology, which offers many benefits, has replaced the conventional buying pattern. The straightforwardness of use develops alongside the expectations, which have likewise fundamentally increased since customers have utilized a variety of web sites. As a result; the elements of the Indian retail market have changed essentially. The increased use of the internet and convenience of utilizing different e-following sites is the cause of the developing interest in them. The ubiquity of this stage at first increased in metropolitan markets, yet it has since moved to rustic areas too, which are generally underserved and have enormous demand potential considering the development of the internet. Due to the increased reception of technology achieved by e-commerce, little organization owners and entrepreneurs were able to begin new businesses or develop current ones. The generation after the millennial, known as Generation Z, includes people brought into the world between the late 1990s and today. The use of internet-based technology is generally prevalent among this generation, which has grown up around electronic gadgets since the beginning.

1.1. Understanding Generation Z

Gen Z accounts for 21% of the population and is quickly becoming more important to businesses than Gen Xers. They will significantly affect future developments

ISBN - 978-93-95060-79-0

and user habits. So, businesses and academics are trying to figure out what Gen Z wants and how they purchase so that they can attract and retain them as online customers. Generation Z, the most recent group of teenagers, attain full maturity between the ages of one and five. The current youth are unlike those before them because they are bold, independent, emotional, expressive, creative, and curious. A stronger inclination for consumer behaviour and a lack of instantaneous preparation and points of view while making impulse-triggering site attribute variables features purchases are the outcomes of Generation Z's heightened sensitivity to correspondence patterns. When determining whether to make an online purchase, users take into account site qualities including ease of use and aesthetic appeal.

1.2. Gen Z's online shopping behaviour

Gen Z's online shopping behaviour is interpreted as including every single behavioural expression, from developing a purchase intention to selecting an item to purchase and settling on a last choice, as well as from selecting to evaluating items, circumstances, and buying strategies (Saputro, 2023). Customers will eventually come to trust one another and make purchases. Because Generation Z is very tech-canny, each gathering of customers will have different buying propensities. Before making a purchase, Generation Z will research the supplier's sales activities by reading customer reviews, visiting the organization website, etc. They will likewise seek online expert advice before making a huge purchase (Syahdan, 2021). What's more, Gen Z likewise uses reference gatherings, like asking friends and family for recommendations before making a purchase. Gen Z frequently continues to shop online and encourages friends and family to utilize the buying channel after feeling secure and satisfied with the calibre of the goods and services; this is a huge component in the decision to do as such (Thangavel, 2021).

2. RESEARCH OBJECTIVES

1. To examine variables influencing Gen Z's online shopping behaviour.
2. To recognise some of the internet purchasing behaviours of Generation Z.

3. LITERATURE REVIEW

Wahyuningsih et al., (2022) as indicated by their review, Gen Z consumers are more

ISBN - 978-93-95060-79-0

inclined to choose superior grade, ecologically responsible items. Numerous members of Generation Z witnessed their parents struggle during the 2008 financial emergency and suffer considerable losses. They are hence more frugal and conscientious. Consumers in generation Z are less likely to trust companies than older age bunches are. They choose to follow well-known, well-liked influencers on YouTube and Instagram instead. They choose to use mobile wallets (Wahyuningsih, 2022).

Vasic et al. (2019) developed customer satisfaction with their online purchases in the Serbian market is analyzed utilizing a research methodology. Security, information accessibility, delivery, quality, estimating, timeliness, and customer fulfillment are the seven gatherings into which the conceptual model's complete of 26 components can be broken down. Input model parameters were collected through online surveys utilizing the appropriate Internet-enabled devices. The legitimacy of the developed model was confirmed utilizing the Corroborative Factor Analysis and the Incomplete Least Squares techniques. The analysis of the obtained information confirmed the primary research hypotheses, which state that the factors of security, information accessibility, transportation, quality, cost, and time have a direct effect on customer satisfaction in online buying on the Serbian market (Vasic, 2019).

Rubin et. al. (2020) this study expects to investigate how customer mindsets contribute to online shopping truck abandonment. To investigate the effect of consumer mindsets (i.e., unique versus concrete) on purchase intentions, three experimental experiments were carried out. The discoveries show that consumers who shop online with a theoretical (as opposed to concrete) perspective give the items in their trucks a higher need rating and are therefore more likely to make a purchase, which lowers the rate of shopping truck abandonment. The results suggest that by applying strategies that enable customers to think dynamically, online retailers can lower the percentage of shopping truck abandonment. By bringing up a huge underlying process influencing online shopping truck abandonment, this research adds to the group of literature (Rubin, 2020).

Sudirjo et al. (2023) the centre is at what generation Z's buying propensities suggest for online retailers in terms of site quality,

ISBN - 978-93-95060-79-0

security, services, and shoppers' overall enjoyment, as well as how this last factor affects online impulse purchases. Generation Z's spending propensities, alongside the lightning-quick development of online shopping, promote unplanned purchases. This quantitative review relied on information gathered through methodical inspection for its decisions. There were 159 people in West Java between the ages of 18 and 35 who identified as part of generation Z and had shopped on the West Java Shoppe website. Information analysis makes use of the Primary Equation Model (SEM) and the SmartPLS 3.0 projects. The discoveries demonstrate that site features, yet not security measures, fundamentally affect impulsive buying behaviour in the advanced marketplace. Services that facilitate online buying have less of an effect on impulsive purchases made on the web. Site characteristics, security measures, and online buying services all contribute to the shopper's overall satisfaction. Shopping pleasure is a more huge inspiration of impulsive online purchases (Sudirjo, 2023).

Punyatoya et al. (2019) this study is likely to examine the various factors that influence the evolution of each sort of client trust in the advanced space and how that shapes customer satisfaction (CS) and dependability intention (LI). Approval of the review model utilizing survey was performed. Information from 334 Indian clients was used in a primary equation modeling analysis of the model's causal pathways. Cognitive and affective trust are demonstrated to be empirically discernible characteristics in the context of online buying. Cognitive and emotional trust are remembered to mediate the connection between a website's perceived quality, security and protection approach, past interaction experience, perceived e-retailer repute, shared value, and CS. CS's positive effect on LI's attitude about the online shop is additionally noteworthy. The review provides useful data on how Indian customers rank online stores. These nuggets of shrewdness will help domestic and worldwide online merchants in developing and implementing strategies to support client trust, a key concept in both CS and LI. This point of convergence proves beyond any reasonable uncertainty that customers' level of confidence in online businesses is a basic aspect in building enduring relationships with those customers (Punyatoya, 2019).

ISBN - 978-93-95060-79-0

4. RESEARCH METHODOLOGY

The research approach used to examine the elements affecting Generation Z customers' buying decisions in the context of Indian e-commerce. The methodology offers a methodical method for gathering, examine, and evaluate information to meet the objectives and hypotheses of the review. Both essential information and secondary sources were employed in this review, and they were gathered from a variety of diaries, research papers, websites, books, reports, and articles that were published online.

4.1. Research scale

Utilizing the discoveries of a review of documents on Gen Z's online buying propensities, researchers were able to synthesize and gather information for research distributions as articles and book chapters. As per research utilizing the Web of Science information system, key studies from 2010 to the present have been published by Elsevier, Scopus, ProQuest, SpringerLink, Researchgate, and Google Researcher, and some unique theoretical works have time. The creator has developed a research framework and research model from the distributions since 2001.

4.2. Research sample

This study uses multivariate regression and exploratory factor analysis (EFA), therefore it needs no less than 05-10 observations for each variable. From that point, calculate 20 x 10 = 200 observations as the smallest necessary sample size. The review makes use of cross-sectional information from a Generation Z survey conducted in different Indian cities. A handy non-random sample method was used to direct the survey online using a Google structure from January 2023 to Walk 2023; the survey URL was made available to general society via virtual entertainment. When the expected sample level is attained, the survey will end to verify the legitimacy of the information. 200 votes from respondents between the ages of 11 and 26 who completed the survey after two months are eligible to be analyzed.

4.3. Variables used in this study

- **Dependent Variables**

Online shopping behaviour of Gen Z (OBB)

ISBN - 978-93-95060-79-0

Gen Z, generally referred to as people brought into the world between the middle of the 1990s and the beginning of the 2010s, demonstrates distinctive online shopping behaviours that are influenced by their specific childhood in the advanced age. Having grown up with cell phones, web-based entertainment, and the internet as fundamental components of their life, Gen Z is essentially distinguished by their computerized fluency and knowledge of technology (Tiwari, 2020). They prefer liquid, user-friendly, and mobile-optimized websites and applications while buying online as a result. Before making a purchase, they frequently direct in-depth internet research and rely on user reviews, user-generated content, and influencer recommendations to guide them.

Genuineness and brands with a conscience are profoundly valued by Generation Z. Companies that share their values — like maintainability, diversity, and ethical business practices — are more likely to receive their help. They search for businesses that resonate with their objectives and sense of self and have strong online presences and active virtual entertainment profiles (Thangavel, Consumer decision-making style of gen Z: A generational cohort analysis, 2022). Also, Gen Z appreciates speed and convenience; they frequently choose same-day or next-day delivery alternatives and use membership services to streamline their buying routines.

What's more, Gen Z is very price sensitive and skilled at finding the finest deals. They routinely use markdown codes and cash back deals while looking at costs across different online merchants. They are attracted to social commerce, which permits them to make purchases directly through virtual entertainment sites. However, they expect price and transportation cost lucidity (Veybitha, 2021).

To wrap things up, demand for augmented reality (AR) and virtual reality (VR) shopping experiences reflects Gen Z's fondness for immersive buying. They appreciate dynamic item perceptions and virtual take a stab at capabilities, which add interest and immersion to the online buying experience.

- **Independent Variables**

Convenience (OC)

ISBN - 978-93-95060-79-0

Gen Z understands convenience as the absence of travel requirements or the need to waste time going out to search for and purchase items. Instead, customers just need to follow a few easy steps while settling down anywhere there is an internet sign to be able to purchase however much they like. Furthermore, there are more payment choices available while shopping online, for example, cash, transfer, e-wallet payment, reward focuses, etc., which appeals to Gen Z consumers.

Diversity of goods (GD)

The term "diversity of goods" refers to most of commodities that can be purchased online as well as in the conventional mode of shopping, making it even simpler to access a variety of goods that are not restricted by geography. The sum and variety of items that can be found while making an online purchase is sometimes referred to as the diversity of goods. This approach criterion makes it evident that the internet market will be more desirable than the conventional market, especially in the current climate of disease outbreak, travel restrictions, and rising travel expenses between regions. The more easy and varied access to items on the web channel, the more expensive it gets as a result of the rise in petrol prices and the reduction in shopping time.

Perception of trust (OT)

When customers choose to shop online, perceived reliability refers to their confidence and trust in the business; they feel that this is a reliable address and aren't concerned about getting conned or buying some unacceptable items because of misleading advertising. Furthermore, service providers are attempting to give consumers the best services possible alongside the most functional return and sales policies so they will feel more confident and delighted. The trust of Gen Z in online buying is likewise tested by examining the positive comments of consumers who have made previous purchases or have acquaintances in the seller's customer list. Advancements and marketing are likewise more "real" with the goal that buyers are not "hallucinated" when buying online.

Online shopping trust (OB)

Consumers will have confidence in online shopping, sellers, and online payment when it goodly affects them. After that, they will keep making purchases online and encourage and

ISBN - 978-93-95060-79-0

expose their friends and family to do likewise. Furthermore, when the capability of an online shopping channel is acknowledged and developed, it will grab the eye of associations that protect consumer privileges and the general public, giving the younger generation confidence when they purchase.

Perceived purchase and financial risk (OR)

Online shopping has different potential risks notwithstanding its convenience and diversity of items during the access, decision-production, payment, and transportation phases. One of the principal dangers to be mentioned is that the real things that are purchased may differ from the website's photos or might be lost during delivery. The next risk is financial, since it is possible for data to be leaked about an individual or their personal record, or they might risk losing money when exchanging goods. Gen Z clients' online buying processes are hampered by these obstacles, which should be removed and replaced with services that foster customer confidence.

Comparison to other Sites

Members of Generation Z spend most of their time online engaging in virtual forms of entertainment and commerce. They see online advertisements while doing so, and if they find such advertisements engaging, they are more likely to continue their exploration of the web. When they find something they like, they often wait to buy it until they have done some pricing comparisons across several online retailers.

5. DATA ANALYSIS AND RESULTS

5.1. Descriptive statistics

The descriptive findings of the study sample are presented in Table 1.

Table 1: Descriptive Results

Characteristics	Frequency	Percentage
Gender		
Male	67	33.5%
Female	133	66.5%

ISBN - 978-93-95060-79-0

Age		
11 to 13	9	4.5%
14 to 16	18	9%
17 to 19	45	22.5%
20 to 22	71	35.5%
23 to 26	57	28.5%
Educational qualification		
Secondary school students	17	8.5%
High school students	53	26.5%
Undergraduates	81	40.5%
Workers	49	24.5%

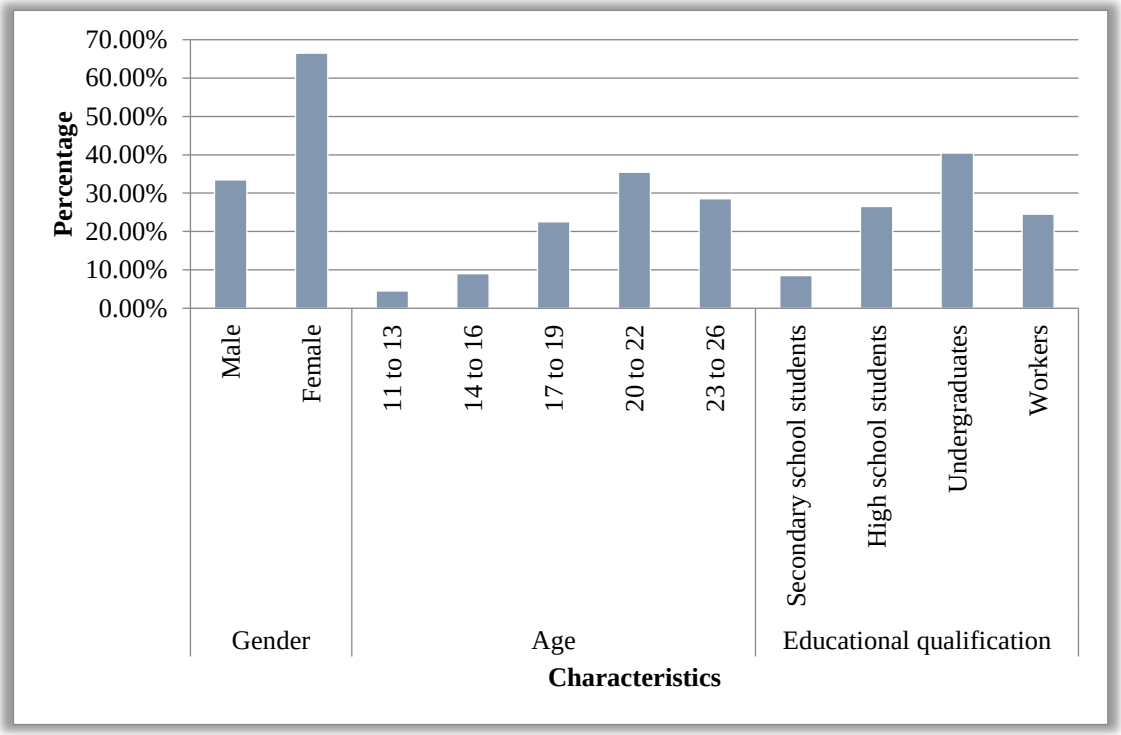

Figure 1: Graph showing the percentage of descriptive results

Table 1 breaks down survey members based on three principal factors: gender, age, and educational foundation. Gender-wise, obviously the sample has a little higher extent of women than men — 66.5% of respondents are women, compared to 33.5% of respondents who

ISBN - 978-93-95060-79-0

identify as men. This indicates that there was a gender hole in the survey populace. The information demonstrates that responders are generally evenly dispersed across the range of ages. The sample's youngest age range, 11 to 13, makes up 4.5% of the populace, followed by 14 to 16-year-olds at 9%. There were a sizable number of youthful grown-ups in the sample, with 22.5% of respondents in the 17-19 and 20-22 age gatherings and 35.5% in the 20-22 age bunch, respectively. A varied age range is further demonstrated by the way that 28.5% of respondents were in the 23-26 age bracket. The heft of responders are either undergraduates (40.5%) or secondary school students (26.5%) when it comes to educational foundation, showing a concentration on the younger demographic. 8.5% of the sample is made up of secondary school students, while 24.5% is made up of workers. This dissemination represents a range of employments and educational levels among the populace polled, with a clear preference for those seeking after higher education.

5.2. Reliability test

Table 2 displays the findings of the Cronbach's Alpha reliability test.

Table 2: Cronbach's Alpha

Reliability Statistics		
Research Variables	**Observable Variables**	**Coefficient**
OC	4	0.898
GD	3	0.891
OT	4	0.871
OB	4	0.854
OR	5	0.900
OBB	4	0.783

The table records significant details about numerous review variables, for example, the number of observable variables contained inside each variable and their corresponding coefficients, which connote the internal consistency or reliability of these measurements. With the highest coefficient of 0.900, "OR" stands out especially well and demonstrates outstanding internal consistency among its 8 observable variables. With coefficients of 0.898 and 0.871,

ISBN - 978-93-95060-79-0

respectively, and each including 7 observable variables, "OC" and "OT" likewise show great dependability. Despite having 6 and 7 observable variables, respectively, "GD" and "OB" have somewhat lower coefficients at 0.891 and 0.854, showing a decent however marginally lower level of internal consistency. The last coefficient for "OBB" is 0.783, demonstrating that its 7 observable variables have a respectable level of internal consistency. The reliability of measurements inside these research variables is highlighted by this table, with "OR," "OC," and "OT" being especially hearty, while "OBB" exhibits marginally lower yet at the same time respectable reliability.

5.3. Exploratory factor analysis EFA

Table 3 shows the discoveries of the KMO and Bartlett's Test for the independent variables.

Table 3: KMO and Bartlett's Test Results

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.851
Bartlett's Test of Sphericity	Approx. Chi-Square	5640.239
	df	419
	Sig.	.000

The factor analysis is absolutely consistent with the review information, as shown by the KMO test discoveries, which demonstrate that the KMO coefficient is 0.851 > 0.5. The Bartlett test result, which likewise indicates that the observed variables are correlated in the populace, is 5640.239, with a significance level of Sig = 0.000 0.005. This outcome is completely consistent with how many independent factors.

Table 4: EFA exploratory factor analysis outcomes

	Rotated Component Matrix[a]				
	1	2	3	4	5
OR1	.864				
OR2	.861

6. RECOMMENDATION AND CONCLUSION

As indicated by the research, customers are using the online marketplace for a wider range of goods purchases as they become more used to it. The purchase process is dynamic and continually evolving. The internet gateways are attempting to capture customers after realizing the expanding sales potential. Understanding the elements influencing the buying behaviour of internet consumers is becoming more and more significant in this present circumstance. There are between 2.52 and 2.52 billion members of Generation Z. Otherwise called computerized natives, they interact with one another and develop a lifestyle entirely online. Because they have shorter attention ranges, consume a ton of media, and have access to a wealth of study materials, Gen Z can make better decisions. As per the results of the research concentrate on the hypothesis, convenience, perceived trust in endlessly shopping trust all have a critical effect on consumers' buying decisions. There is no correlation between

ISBN - 978-93-95060-79-0

checking user reviews for an item and looking into more details on other shopping websites. The perceived danger component specifically has the opposite influence. These results are critical for companies and marketers that need to effectively connect with and serve Generation Z, a generation that is set to influence the direction of Indian e-commerce in the future.

ABSTRACT

The influence of online entertainment continues to grow in the ever-changing Digital India market. This research examines the effect of online entertainment advertising on customer behaviour, with a particular emphasis on Lidl and IKEA in the Finnish retail industry. The study reveals multiple points of view by analysing content and conducting interviews with six store managers. A thorough analysis of the demographics of the participants found a diverse group of leaders with a range of experience levels across age, education, and professional fields. According to the results, advertising for entertainment products sold online has a major impact on buyers' tastes and decisions. Despite generally positive feedback, some customers may have trouble keeping track of details. This study sheds light on the complex interplay between virtual entertainment promotion and consumer behaviour, providing valuable information for businesses navigating the global digital transition.

Keywords: *Marketing, social media, Navigation, Consumer Behaviour, Influence.*

1. INTRODUCTION

When it comes to informing and entertaining customers, virtual entertainment has a significant impact in Digital India. There is strong evidence that advertising in online entertainment can boost brand recognition, consumer decisions, and public support. It could also generate new ideas, boost brand traffic, provide detailed information, create a customer base, and cultivate existing relationships. All of these things can help strengthen consumer loyalty and enhance public perception of the brand. In any case, regarding Digital India. It is remarkable that so little study has been done in this area, given the importance of trust and perceived market benefits to customers' decisions to buy online entertainment. Both of these aspects affect how consumers perceive purchasing online. Thus, there are issues in the perception of the relationship between online virtual entertainment firms and shopper purchasing behaviour in Digital India due to the lack of information regarding the function of trust and perceived market benefits in this context.

The expansion of globalisation and the dissemination of knowledge made possible by the Internet have stimulated business expansion. Clients have a more full scope of labour and products, which has provoked vehement opposition. While many businesses are prepared to use online entertainment advertising to promote their brands, few have equipped their managers to understand the medium. The ability to build good customer buzz and interest in the company's products or services depends on the ability of business executives to produce engaging content on the web.

1.1.Evolution of social media marketing

The rise of cyber-based media for amusement Between 1995 and 2002, the Internet bubble gave rise to a new industry: online advertising. The internet's meteoric rise has made it a useful tool for advertising. Foster sites were among the earliest tools used by organisations to establish a web presence and boost their reputation. Organisations can now use web crawler enhancers (Web optimisation) because to the rise of web indices like Google, Hurray, and MSN. With the help of Web crawler Enhancers, businesses may now boost their visibility in search engine results.

The proliferation of content promotion has been aided by new articles published on the site's second generation. Inbound

ISBN - 978-93-95060-79-0

promoting popurlarly knowns as Happy showcasing extended the value creation to customers while, simultaneously, acquiring business to the various organisation. As a result, the sites have replaced traditional outbound marketing strategies including cold calling and product placement. The business world has finally caught on to social networking sites like Facebook, Twitter, and Linkedin. The collaboration could differentiate among available virtual entertainment options and select the one that would have the greatest positive effect on their strategy.

1.2. Role of Social media advertising in influencing consumers' perspectives

The research shows that people are influenced to make expensive or cheap purchases based on the recommendations of friends and online acquaintances in the realm of virtual entertainment. The proposed link between online entertainment and consumer navigation posits that the latter has an impact on consumers' promotion mindsets, brand quality, and purchasing expectations while browsing the web.

Figure 1: Strategy for advertising using social media

Buyers are difficult to influence on the best way to buy directly, but you can still have an effect on their final decision and preferences by acting as an intermediary. Either excellent branding significantly affects consumers' ultimate decision making when making costly purchases. Furthermore, when company customers' friends offer suggestions on clear products via virtual entertainment, it directly influences their choices on product purchases.

Advertising through web-based entertainment provided by business marking eventually affects buyer outlooks and expectations. Using the aforementioned information, marketers can create strategies to attract and retain customers. Numerous advertisers in the

ISBN - 978-93-95060-79-0

ongoing age utilize virtual entertainment as a device for promoting efforts. Because it is practical to advertise products and services via internet entertainment, it facilitates communication with customers.

1.3.Marketing via social media and its effects on consumers' purchasing behaviour

The social reinforcement of preconceived notions about particular brands can also influence consumer behaviour. Moreover, peer interchanges and social instruments can likewise lead explicit clients to intend to purchase a brand. Consumers who base their purchases on the aforementioned reviews are more likely to put their money behind recognisable company names.

Online entertainment has an impact on consumers' shopping decisions, but it also contributes to the advancement of knowledge in other areas, such as the study of legislation and the selection of jurors. In business law cases, for instance, jurors may access online advice to aid them in their deliberations. The author suggests that Twitter is the greatest website for web-based media to exchange data and news because consumers can access up-to-date information there. Even those who focus on the distant past recognise the possibility of social impact hypotheses having an effect on one's life choices.

The authors reason that people who partake in online games or other forms of virtual entertainment are likely to be connected to one another and hence affected by the activities taking place inside their respective online communities.

1.4.The effect of social media advertising on repeat purchases

Conviction in a brand and situational elements like location, design, and even natural tidiness can both influence a customer's propensity to repurchase a particular brand. Customers have faith in the association's efforts because of the group's steadfastness and the attractiveness of its vision. This attitude makes it easier for consumers to make repeat purchases due of the product's dependability. Many people today would rather buy online and have their products delivered to their homes than go out to a physical store because of the accessibility of knowledge beyond the physical world made possible by virtual entertainment. Lighting, layout, music, and aesthetics are all contextual aspects that can affect a customer's tendency to make a repeat purchase. If you've had some time to think about it, you

ISBN - 978-93-95060-79-0

could be in a better frame of mind to make a similar purchase. This is due to the fact that the company is likely to meet its customers' demands at the precise time they have them, as well as other reasons such as the ease with which supplies may be restocked, the convenience of the stores' locations, the high income of the target demographic, and so on. Group, individual, and corporate purchasing patterns vary because consumers' perceptions and experiences with the numerous brands available to satisfy their needs and wants vary.

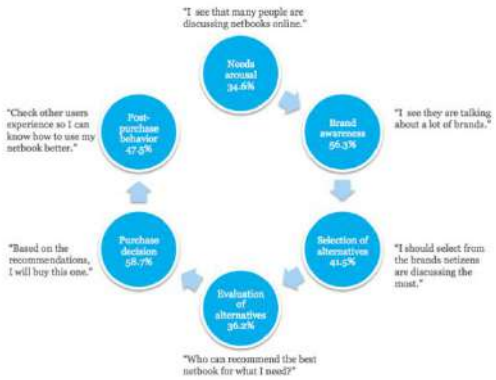

Figure 2: Cycle of online purchase

2. LITERATURE REVIEW

Dwivedi et al. (2021) Consumer propensities and corporate practices have moved because of the far reaching reception of web and social media. Because of social media and advanced marketing, organizations can set aside cash, raise brand mindfulness, and lift deals. However, there are significant obstructions, like irritating and meddlesome internet based brand presence and negative electronic informal. Specialists in the fields of advanced media and social media marketing have contributed their insight to this article. Viewpoints on additional particular issues, for example, man-made reasoning, increased reality marketing, computerized content administration, portable marketing and publicizing, B2B marketing, electronic informal, and moral issues in that, are given by the specialists as well as an itemized story on key parts of this significant subject. By distinguishing the impediments of past examinations, illustrating the holes in the writing, and proposing new lines of request that can add to growing comprehension we might interpret computerized and social marketing, this study makes a significant and opportune commitment to the field.

Chang et al. (2019) Albeit in-feed social adverts on social media are growing quick all over the planet, the substance methodology of organizations introducing in a human manner gets exceptionally less concentration. This study explores whether expanding "likes" on WeChat Second ads

ISBN - 978-93-95060-79-0

is conceivable by decisively matching the account individual utilized in the advertisements (first-individual versus third-individual) with the ideal brand picture (warmth versus ability). In view of our meta-examination of five examinations, we presume that the inspiration of social having a place is stirred up when first-individual portrayal is matched with cordial pictures, while the inspiration of personal development is stirred up when third-individual portrayal is matched with learned pictures. We likewise track down that the impacts of shifted matches on preferring aim are directed by a significant individual trademark (self-checking). This examination has both hypothetical and viable ramifications for advertisers carrying out in-feed social promotions on social media. It adds to the writing on publicizing content methodology and promoting language on social media.

Pelet et al. (2017) There's been talk about how "flow" is crucial to grasping online behaviour and characterising the engaging quality of digital interactions. The effects of flow are studied here, with a focus on their manifestations during social media consumption. The results show that telepresence enhances the five facets of flow—pleasure, focus, difficulty, agency, and exploration. Overall flow is favourably associated to these aspects (excluding control), which increases time distortion and frequency of social media use. We also create a model to show the intertwined nature of flow, telepresence, time distortion, and the use of social media, thereby expanding the nomological network on flow theory. Interesting findings about users' behavioural intentions when using social media are presented, highlighting the idea that overall flow can distinctively effect social media users in a flow experience. Theoretical and practical ramifications of these findings are examined.

Voramontri&Klieb (2019) The motivation behind this study is to lead observational examination into the capability of social media in the dynamic course of clients making complex buys, characterized here as those encapsulated by significant brand contrasts, high consumer commitment and hazard, and high exchange expenses and low recurrence. The model adjusts the EBM exemplary's data gathering, elective gauging, and last buy choice stages. A quantitative report investigates how much social media really transforms people. As indicated by the

ISBN - 978-93-95060-79-0

discoveries, social media use influences consumers' bliss at different focuses during the purchase choice and post-buy assessment processes, starting with the exploration and assessment stages. The review zeroed in on educated purchasers in South and Southeast Asia and included finished exchanges, as opposed to deserted questions.

Chopra et al. (2020) The reason for this study is to lead observational investigation into the effect of social media on client decision. A quantitative report investigates how much social media really completely changes people. Client audits of items and administrations are progressively being overwhelmed by outsiders in web-based discussions, which thus influences choices made in the disconnected world. Consumers are effectively taking part in web-based discusses thanks to social systems administration destinations, regardless of the way that advertisers have little influence on the subjects, timing, or recurrence of these discussions. As per the discoveries, social media use influences consumers' bliss at different focuses during the purchase choice and post-buy assessment processes, starting with the examination and assessment stages.

Stephen, A. T. (2016) Recent studies on customers in online and social media marketing contexts are discussed in this article. Consumer digital culture, responses to digital advertising, effects of digital environments on consumer behaviour, mobile environments, online word of mouth (WOM), and (v) online WOM are the five topics highlighted. There is a wealth of information to be gleaned from these articles on consumers' interactions with the digital worlds in which they find themselves on a regular basis. There is still plenty to learn, and most of what is known focuses on word-of-mouth marketing, which is only one facet of today's complex digital consumer landscape. Several suggestions for future research are made in an effort to get scientists thinking about issues beyond the ones they've previously focused on.

Bigne et al. (2018) This exploration takes a gander at what social media and other disconnected factors mean for the internet buying and suggesting conduct of sightseers for financial plan carrier administrations. Drawing on the Hypothesis of Contemplated Activity (TRA), this examination explores the impact of disconnected social impacts (relational and outside influences) and

ISBN - 978-93-95060-79-0

investigations online Consumer-to-Consumer (C2C) data trades as a driver of client demeanor towards online buys. We theorize that these components increment positive WOM and e-WOM in minimal expense settings, prompting more web-based repurchase aims. The reasonable model is approved with an example of 441 Spanish internet based purchasers of minimal expense carrier administrations utilizing primary condition displaying. Repurchase purpose and verbal exchange online are altogether influenced by disconnected relational impacts (like loved ones), while e-WOM is unaffected. In any case, disconnected outer tensions (like the media and specialists) meaningfully affected web-based repurchase goals or WOM, and on second thought exclusively influence consumers' aims to advance future acquisition of minimal expense aircraft administrations on social systems administration travel locales. Likewise found is the connection between online C2C data trades and changes in disposition, which thus impressively affects verbal exchange and electronic verbal (e-WOM) repurchase goals.

3. RESEARCH METHODOLOGY

3.1.Objectives of the Study

1 In the context of global digitalization, how much did consumers' access to internet entertainment influence their spending habits?

2 How much did people's willingness to spend time online watching entertainment content influence their willingness to engage in e-commerce across international borders?

3 Thirdly, how much did the ease of access to online entertainment platforms affect the variety of consumer preferences and selections during the global digital transformation?

4 In this era of global digitalization, how much did the incorporation of online entertainment into marketing plans affect brand loyalty and consumer retention in different regions?

3.2.Research Design

The study used a contextual inquiry technique with the goal of thoroughly analysing certain situations from the Finnish retail industry, with a particular emphasis on Lidl and IKEA. This

ISBN - 978-93-95060-79-0

method made it easier to analyse these specific companies in-depth and allowed for a more thorough investigation of how online entertainment advertising affects consumer behaviour.

3.2.1. Purpose

Understanding and analysing how online entertainment advertising affects customer behaviour in the context of the chosen retail organisations was the main objective of the study. Through the application of a contextual investigation technique, the study sought to offer a comprehensive and perceptive analysis of this influence.

3.2.2. Structure

A report detailing the research findings was produced and delivered, with each segment covering a distinct facet of the inquiry. A methodical and thorough investigation of the major elements pertaining to online entertainment advertising and consumer behaviour was made possible by this framework.

3.3.Sampling

The necessity of sampling was determined by practical and logistical factors, considering the difficulties of researching the complete population. This method made the process of gathering data more focused and controllable.

3.4.Data Collection

3.4.1. Rationale for Primary Data

To gather verifiable proof of the influence of online entertainment advertising on consumer behaviour, primary data gathering was chosen. In this instance, the managers of the chosen stores—Lidl and IKEA—were important players.

3.4.2. Participants

As part of the data gathering procedure, six participants—more precisely, the managers of Lidl and IKEA—were assessed through interviews.

3.4.3. Data Collection Process

Seven days were dedicated to gathering the data. Whatsapp was used for the online interviews, with one participant meeting each day. This meticulous process made it possible to collect data in an organised and thorough manner

ISBN - 978-93-95060-79-0

4. DATA ANALYSIS AND INTERPRETATION

Table 4.1: Participant demographic data

Participant	Age	Gender	Education Level	Experience (Years)
P1	35	Male	Bachelor's	8
P2	40	Female	Master's	10
P3	32	Male	Bachelor's	6
P4	45	Female	PhD	12
P5	38	Male	Master's	9
P6	36	Female	Bachelor's	7

The study's participants are diverse in terms of their age, gender, level of education, and work experience. The range of ages, which includes a mix of professionals in their mid-career, is 32 to 45. There is a balanced distribution of genders, with three men and three women. Though there are differences in educational attainment, most have advanced degrees (PhD or Master's). With a range of 6 to 12 years of professional experience, the participants are an experienced group. With a focus on Lidl and IKEA in particular, this diversity is useful for gathering a wide range of viewpoints on how online entertainment advertising affects consumer behaviour in the Finnish retail industry.

Table 4.2: Average Scores and Synopsis

Question	Average Rating
Impact of Online Ads	4.17
Integration Effectiveness	4.17
Tracking Challenges	3.17

ISBN - 978-93-95060-79-0

Overall Satisfaction	4.17

The average rating given by participants was continuously excellent, highlighting the benefits of online advertisements and their efficacy in integrating them. Tracking difficulties, on the other hand, scored rather lower, suggesting room for development. Overall, the survey indicates that shop managers have a positive opinion of online entertainment advertising, and there is room to improve tracking systems in order to raise satisfaction even more.

Table 4.3: Answers to Likert Scale Questions from Participants

Participant	Q1: Impact of Online Ads	Q2: Integration Effectiveness	Q3: Tracking Challenges	Q4: Overall Satisfaction
P1	4	5	3	4
P2	5	4	2	5
P3	3	4	4	3
P4	4	5	3	4
P5	3	3	4	3
P6	5	4	2	5

ISBN - 978-93-95060-79-0

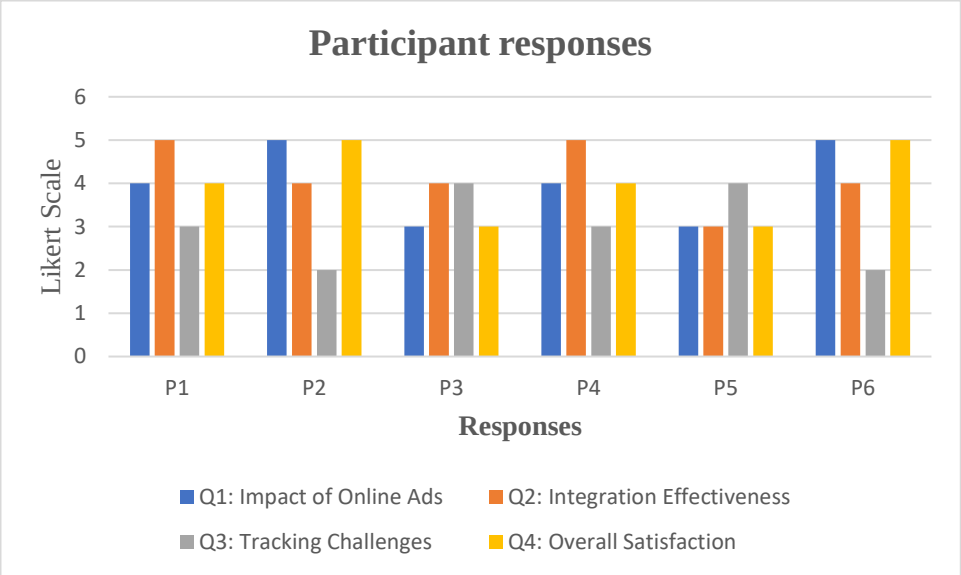

Figure 4.1: An illustration of the responses from the participants

With average ratings of 4.17, participants consistently assessed the effectiveness of integration and the impact of online marketing favourably. With a somewhat lower score of 3.17, tracking challenges should be improved. The high level of overall satisfaction indicates that, in spite of certain difficulties, individuals were generally happy with how online entertainment advertising influenced their purchasing behaviours.

5. RESULTS AND DISCUSSION

By examining the nuances of the data, the study sought to clarify the complex relationships between online entertainment promotion and consumer behaviour. Determining how these digital promotions affect consumer preferences and purchase decisions was the main goal. Through the use of a thorough methodology and content analysis tools, the study was able to extract insightful information from in-depth interviews with six respondents who were carefully selected.

Carefully examining participant demographics was a crucial aspect of the research, guaranteeing a varied and comprehensive representation. Age, education, and professional backgrounds were among the socioeconomic factors that were methodically examined. The results of this analysis showed that the participants were a diverse group of people, middle-aged and older, and in leadership roles in their various organisations. Remarkably, most of them were undergraduates, and only a small number were doctoral students.

ISBN - 978-93-95060-79-0

The inquiry gained depth and context from the participants' significant work experience, which ranged from two to twenty years. This careful segmentation made it possible to thoroughly examine a wide range of viewpoints, which improved our comprehension of the complex interactions between online entertainment advertising and consumer behaviour. The results provide light on potential ramifications for business practises and advance a more comprehensive understanding of the complex ways that virtual entertainment promotions affect consumer decisions and preferences in the retail sector.

6. CONCLUSION

To elaborate, this study highlights the significant impact that online entertainment promotion has on consumer behaviour in the retail industry. The complex dynamics at work are clarified by the insights gained from the thorough examination of the qualitative material as well as the one-on-one interviews with the six carefully chosen respondents. Carefully examining participant demographics showed a patchwork of viewpoints influenced by a variety of variables, including age, education, and work experience. Crucially, the research demonstrated a strong correlation between online entertainment advertising and how it affects consumers' tastes and critical purchasing decisions.

Considering the strategic positions that the participants held—all of whom were in leadership roles with varied degrees of professional experience—the relevance of these findings becomes even more apparent. Their extensive expertise, which ranged from two to twenty years, helped to provide a comprehensive grasp of the topic and made it possible to investigate the ramifications of online entertainment advertising in the retail industry from all angles. Through the process of deciphering the intricacies of consumer behaviour, this research provides retailers with useful information that they can utilise to enhance their web-based entertainment advertising tactics, which in turn improves sales performance and cultivates repeat business. These findings provide current and useful insight for firms looking to handle the dynamic convergence of online entertainment advertising and consumer behaviour as the retail landscape continues to change in the digital era.

Abstract

This study investigates the information processing limits of social media users and assesses the impact of information speed on their behavior, focusing on susceptibility to social contagions. A random sampling technique was employed in Higher Education institutions, resulting in 200 respondents from diverse educational backgrounds. Primary data were collected through questionnaires, and statistical tools, including, percentage analysis, and Multiple Regression were applied for analysis. The demographic breakdown highlighted a balanced gender representation, with 55% male and 45% female respondents. Age-wise, the study revealed a substantial relationship between age and multimedia impact, emphasizing the growing influence with age. The sample pool exhibited diversity in educational qualifications and faculties. The subsequent analysis explored the influence of social media and multimedia on students based on gender and age. While gender showed no significant impact, age emerged as a crucial factor. Multiple stepwise regressions affirmed the substantial impact of social media and multimedia on students.

Keywords: Social Media, Multimedia, Information Processing, Susceptibility, Higher Education, Demographics, Educational Impact, Regression Analysis, Digital Literacy, Interdisciplinary Education

1. INTRODUCTION

Social networking is growing quickly and turning out to be more common in each part of life, including schooling. Teen understudies are the ones that are generally powerless to the adverse consequences of effectively accessible social media. Understudies experience extraordinary interest, major areas of strength for a for freedom, and a gigantic inner self during puberty. Therefore, numerous understudies express their objection or even inside and out defiance to a school, local area, or home decide that they accept is inconsistent with their own convictions. A youngster's improvement is impacted by a large number of variables, including family, school, and local area.

Unhindered admittance to social media will influence students' personal development. There is a conflict between them on the off chance that the goals are truly particular. The aftereffects of Sheldon's exploration show that social media influences conduct shifts in the two guys and females. Adolescent understudies are significantly affected by the world, particularly by social media that is unreservedly and promptly accessible on the web.

Social networking does, from one viewpoint, valuably advance the requirements for offices and self-improvement. On the other hand, however, it likewise represents a serious gamble because of the possible outcomes. The review reaches the resolution that albeit social media stages like Facebook and You Cylinder have an essential impact in the existences of teen understudies, they could likewise meaningfully affect their schooling. In this manner, adequate information on the standards of social networking development should empower understudies to involve these apparatuses for their own personal growth.

The utilization of social networking destinations is very normal in India. As a matter of fact, increasingly more undergrads are baited to these networking destinations since they give diversion and association open doors. This hence lays out the setting for additional examination concerning this particular occasion. In fact, relational associations act as the foundation of human development and training. Thusly, in the Indian setting, it is basic to look at the degree to which social networking locales are affecting understudies' relational associations.

1.1.Social Media's Commitment to Society

It is a public gathering for emergency help and security data. There have been a few late misfortunes when social media was the main functional method for contact. While many individuals were without power during Super Tempest Sandy, some WiFi towers and cell networks kept on working. Many took to Facebook to depict the harm and console friends and family — or perhaps dear companions — that these were protected. The terrible Boston Long distance race bombings this previous week ignited a worldwide social media development to help individuals out of luck and to share data. As per Advertisement Week, Twitter truly gave an advanced hash tag, #One Boston, worth an expected $200,000, to help the people in question. All the more significantly, social media stages like Twitter have demonstrated to be valuable for neighbourhood occupants as a safety effort. The Boston Police Division tweeted the latest data on areas to stay away from, wounds, and losses of life. Police encouraged guys to utilize social networking locales for the purpose of correspondence, probably with an end goal to keep telephone lines open.

It is an extremely valuable instrument for examining violations. As a matter of fact, police organizations — including the New York Police Division — are starting to investigate violations on social media that are associated with possess. As of late, more than sixty gangsters who flaunted about their crimes on social media were captured by the NYPD. On the off chance that Oregon were some other state:

1. It is a type of influence over governmental issues. Individuals presently have a genuine voice thanks to social media. Simply last month, while the High Court was hearing issues including same-sex marriage, a social media development supporting for marriage uniformity picked up speed. As a matter of fact, brands embraced the pattern by making symbols of white correspondence that were pertinent to them. Social media has the ability to impact political choices and is a strong problem solver. Albeit the High Court hasn't gone with a choice in the continuous conversation, the judges have thought about the public's sponsorship.

ISBN - 978-93-95060-79-0

2. It's the best method for associating over significant distances to yet. Most of us can reconnect with loved ones who live far away without burning through cash on global calls. I could reach out to individuals I met in Australia and South Africa once more. I take a gander at their photos and get a brief look into their lives, so it's useful to have a method for staying aware of their updates despite the fact that I can't truly be there. It is the ideal expansion to email and Skype, among different types of correspondence.

1.2.Platforms of Social Media

When we think of social platforms, Facebook, LinkedIn and Twitter are actually likely the most typical labels. But you will find a huge number of various other sites are existed. At this time there are actually five kinds of social networking including Collaborative projects (Wikipedia, Delicious, and so on), Blogs, Content Communities (Book Crossing, Flickr, YouTube, Slide share, etc.), Social networking sites, Virtual games, Virtual social worlds. Virtual world enables individuals to choose the conduct of theirs in an essential and free fashion therefore following a virtual way of life much like their true life

You will find numerous types of social networking platforms. Social networking includes web and mobile based technology which allow & encourage individuals to work together with any person they really want by making profile and exchanging contents with one another. Accordingly below are numerous types of social networking platforms that are revealed:

a) Social Networks: Social networking sites provide internet services to users to create the own profile of theirs, private portfolios & interests. These profiles as well as pages are actually used to connect with friends, other people and co-workers to be able to discuss combination, content, and media of the. They create interactions with various other people by posting status, commenting on other's status, sharing links as well as pictures or perhaps by some other multimedia. Examples of social networking sites consist of Bebo, MySpace, Google+, LinkedIn, and Facebook.

b) Web blogs: Blog is actually probably the oldest & most popular types of social networking. Blogs are usually

ISBN - 978-93-95060-79-0

considered as internet journals that arrange content chronologically or perhaps by date, month, category as well as year. A Blog is a site, in which blog owner write posts and posted/publish for the individuals to read. We are able to likewise produce video or "vlogs," blogs, which feature shared or maybe homemade video clips. Blogging sites include Tumblr, Blogger, and Word Press.

c) Micro-blogs: Micro-blog options brief posts with words that are not many; it's opposite to journal style posts. Generally, computer users are limited while posting a number of lines of text, or perhaps uploading images and videos. Info very easily. Micro-blogging is extremely well known for publishing fast updates as well as in order to distribute content via mobile devices. The popular micro blogging sites include Tumblr, Pinterest, and Twitter.

d) Content Communities: Images as well as movies are actually organized, shared as well as commented upon by the content material communities" users. Examples of those content communities are scribd, Flickr, and YouTube.

e) Collaboration: Wiki and Wikipedia is the ideal example of social awareness or cooperation. These sites let a community of individuals to include as well as modify content in a community based database. It produces a hub of expertise to make use of as reference by others. For instance: Answers.com, Quora, Wikis, and Wikipedia.

f) Geo location: This kinds of social networking is actually related with mobile device and it establishes a user's location. , for instance, individuals go someplace and they need the friends of theirs to find out about the area of theirs, consequently, they make check in. A favourite example of geo location sharing is 4 square. Facebook additionally presents this check in facility to the users of theirs.

2. OBJECTIVES OF THE STUDY

- To comprehend the current concept of social media and multimedia.
- To examine the requirements, advantages, and disadvantages of social media and multimedia.
- To assess the impact of social media and multimedia on students.
- To investigate the relationship between the usage of social media

ISBN - 978-93-95060-79-0

and multimedia and students' academic performance.

3. LITERATURE REVIEW

(Habes and Partners, 2018) planned to reveal insight into the impacts of social networking on understudies going to additional illuminating colleges and what such impacts mean for their scholastic accomplishment. Because of its capacity to fortify the beneficiary's convictions and advance their patterns and cognizance, social media has become one of the most generally utilized types of correspondence. The review centres around the sites that the specialists checked and noticed, as well as how the sites impacted the worldwide and Center Eastern Facebook market. To discover Facebook's effect, the specialists utilized a trial and similar procedure, introducing their discoveries in light of suggestions and the ends drawn from peer-audited logical exploration distributed in diaries. As per the review, an enormous number of understudies utilize social networking destinations, with a specific accentuation on Facebook, which adversely affects their scholastic performance.

(Akakandelwa et al. 2018) The manner in which understudies impart, associate, and socialize has been altered by social media, which has ended up being practically undeniable and an essential piece of their social and social texture. Along these lines, a lot of understudies' time is spent on social networking. Youngsters and college understudies are believed to be the frameworks' greatest proprietors. There is a developing group of examination on social media use around the world, yet bit of it centres around what social media use means for understudies' social lives in Zambia. This study was exploratory and distinct in nature. It took a gander at the kinds of social networking destinations that understudies frequently use, how long they spend on them, why they use them, and what utilizing social media means for their social lives. 240 full-time understudies in the College of Zambia's Institute of Schooling finished up self-regulated polls, and the Measurable Bundle for the Social Sciences (SPSS) release 23 was utilized to break down their responses. As indicated by the outcomes, What Sapp was the most well-known social networking stage. A large portion of the understudies who were examined said they routinely spent somewhere in the range of thirty and an hour utilizing this particular social networking application. The investigation

ISBN - 978-93-95060-79-0

likewise discovered that the greater part of the understudies said they dealt with social media for only a couple of additional minutes than needed, checked their social media accounts prior to doing anything more, accepted social media harmed their scholastic performance, couldn't decrease how much time they spent on social media, heard analysis about their utilization of social media from others, and felt worried because of utilizing it. Besides, 22.4% of the understudies said they were devotees of social media. More social data was shared on social networking locales by understudies than scholarly data was. Understudies' use of social media truly improves social association. Along these lines, involving social networking in a powerful way while decreasing any adverse consequences is normally encouraged. Besides, it is trusted that our review would animate new examination in this space utilizing bigger and more assorted examples of changing understudy segment qualities.

(Waseem, 2018) Social networking is a gathering that permits individuals all around the world to examine their concerns and contemplations. Prior to finding out about the particular elements of social media, individuals need to get a handle on what's genuinely going on with social media. Actually, the expression "social networking" alludes to the manner in which people or gatherings draw in with each other through the creation, sharing, and once in a while trade of ideas, pictures, recordings, and substantially more over the web and in web-based networks. Since cell phones and intuitive social networking sites like Facebook, MySpace, Twitter, and Orkut are surrounding them, kids are genuinely growing up with social networking as a major piece of their lives. Social organizations are truly modifying the manners by which solid individuals associate with their friends, guardians, and use innovation. There are two impacts of social media. On the in addition to side, social media stages might be very useful devices for experts. They achieve this by helping recently graduated experts in displaying their abilities and seeking after business adventures. Social networking sites may likewise be utilized proficiently for networking. On the negative side, there are various perils associated with online networks on the web. One of the worries is cyberbullying, which alludes to badgering that is done by means of the utilization of electronic designing. We examine each feature of social networking in this

ISBN - 978-93-95060-79-0

exposition, including the two its benefits and disservices. Explicit regions like wellbeing, business, training, youth, and society are the concentration. This examination means to explain the exact manners by which different media will influence society on a wide scale.

The kinds of social networking locales that understudy use, how they use them, and what they mean for their way of behaving for correspondence, learning, social perspectives, and learning motivation are completely distinguished by **(Sriadhi, 2018).** This particular examination, which involves senior secondary school understudies as the respondents, was completed in Medan, Indonesia. The example, which comprises of 184 S.TI and 48 S.RI, is picked aimlessly. Polls, perception, and meetings are utilized to assemble data, and distinct insights are utilized for examination. That's what the examination's decision shows, in spite of the fact that Twitter, Instagram, Wire, and WeChat are truly consumed in a lot more modest sums, the most frequently utilized web crawlers are Google, YouTube, WhatsApp, and Facebook. The typical measure of time spent on social media is 11.31 hours out of each day, with social and diversion targets probably positioning top, while learning and experiences goals rank at 6th and third, separately. Truth be told, SRI understudies utilize social networking more habitually for examining than STI understudies do. The development of learning exercises in spite of a decrease in learning design is one of the noticed direct changes. While the recurrence of commitment builds, its particular quality downfalls. Mental control declines while compassion and responsiveness ascend concerning social way of behaving. As per this particular exploration, it's basic to lay out companionships and tutor kids in utilizing social networking, so risks might be changed over into potential open doors for Indonesia's more youthful ages.

(Calderaro, 2018) Since the web was created, there has been a lot of interest in whether and how computerized stages, like social networking, affect governmental issues. Subsequently, we can now depend on a developing corpus of examination that looks at the numerous associations between social networking and legislative issues from various points. The responses set forth to research the subject are frequently particular, don't necessarily in every case connect with each other, and lead the assessment of its circumstances and end results down assorted streets,

ISBN - 978-93-95060-79-0

much of the time prompting totally various outcomes. Nonetheless, it is recognized that the web has made new roads for correspondence that have definitely had an impact on how data is dispersed in contrast with conventional media. News streak ventures far past public lines and into social, political, and social specialty markets thanks by and large to social media. This section analyzes how the ongoing conditions raise political cognizance. Considering this, this part examines whether and how much social networking impacts governmental issues. In explicitly, we initially examine how the web's organized attributes empower different types of political action and how the presentation of social networking has additionally exacerbated this specific issue. Subsequent to zeroing in on the job that data course plays in advancing political mindfulness and, thus, expanding political cooperation, we talk about how social networking improves this methodology and builds the effect of computerized stages on governmental issues. At long last, we give proof to the effect of social networking on governmental issues by analyzing the basic job that data course plays in the political field across political scenes, political entertainers, and political strategies. We explicitly center around the utilization of social networking for crusading and for the preparation of social developments.

(Al-Abbas, 2017) Understudies can improve their way of learning and advantage from a few scholastic advantages given by social media and the web. Looking at the effect of utilizing social networking on scholarly accomplishment is the primary objective of this specific examination. Since current social media stages like Instagram, Facebook, Twitter, and such could influence understudies' way of behaving and scholastic performance, Ahlia College, Applied Science College, and College of Bahrain were the colleges that were picked. 150 understudies were remembered for the example, uniformly split across the three colleges. The exploration questions plan to address the accompanying: (1) How have ICTs and the Web advanced internationally?; (2) What effect has ICT had on training?; (3) What are the particular impacts of social networking on understudies' scholastic performance at Bahrain Colleges?; and (4) Which social organization sites are more well known among Bahrain College understudies? The discoveries show that social media

ISBN - 978-93-95060-79-0

decidedly affects scholarly accomplishment and that 57% of understudies use WhatsApp as a portable social networking instrument for their scholastic objectives.

(Masood et al. 2017) to survey a speculative social organization type with applications for an example of 34,896 Abu Dhabi schoolchildren, this review utilized underlying condition demonstrating. The really free parts in this unit are connected with kids' mentalities towards social media, their inspirations for utilizing social media stages, the assignments they achieve on these destinations, and the subjects they use. Seen social ramifications and social media's effect on scholastic accomplishment are covered by the reliant builds. The review will frame the connections between the different develops. Analyzed is the aftereffect of a few different factors, like parental mastery. Our review has improved our grasping in the social organization adaptation. The discoveries give belief to the possibility of equal connections between social media results, gaining from social media, and saw performance.

4. RESEARCH METHODOLOGY

This section outlined the research design and methodology adopted to investigate the information processing limits for social media users and the impact of information speed on their processing behavior.

4.1.Sampling

The study employed a random sampling technique in Higher Education institutions to select respondents in Maharashtra states. Random sampling ensured that each unit of the population had an equal chance of inclusion in the sample, promoting unbiased representation. A sample and pilot study involved 50 students from city colleges, with a total of 200 respondents (students) selected for the main study.

4.2.Procedure of Data Collection

The data collection process commenced after defining the research question and designing the research plan. Primary data, collected afresh for the study, were gathered through

ISBN - 978-93-95060-79-0

questionnaires issued to 200 respondents. The respondents, representing various educational institutions, were selected using convenience sampling based on accessibility and approachability.

4.3.Data Collection Tools

Questionnaires were distributed personally after obtaining permissions. Out of the 228 collected questionnaires, 200 were completed. However, only 200 questionnaires were used for analysis due to incomplete or defective responses

4.4.Tools used for Data analysis

The collected data underwent comprehensive statistical analysis, employing a range of sophisticated tools to extract meaningful insights. Percentage analysis facilitated the expression of proportions and trends, providing a quantitative perspective on key aspects of the data.To assess variations among groups . Multiple regression analysis was employed to assess the intricate relationships between multiple independent variables and a dependent variable, unraveling the nuanced interdependencies within the data.

5. DATA ANALYSIS AND INTREPRETATION

In this particular section an effort has been created to look at the perceptions and furthermore, the views of the respondents about the various aspects of social media as well as multimedia. The following section offers the evaluation of Impact of Social media as well as multimedia on the Students.

Table 1: Gender wise distribution of Respondents

Particulars	**Number of Respondents**	**Percentage**
Gender		
Male	110	55%
Female	90	45%
Age		
Up to 21 Years	28	14%
21 - 23 Years	44	22%
23 - 25 Years	72	36%
More than 25 Years	56	28%
Educational Qualifications		

ISBN - 978-93-95060-79-0

UG	80	40%
PG	40	20%
Professional	20	10%
Research	60	30%
Faculty of different department		
Faculty of science	60	30%
Faculty of commerce	40	20%
Faculty of humanities	80	40%
Faculty of engineering	10	5%
Faculty of medicines	10	5%
Medium of Instruction		
Hindi	120	60%
English	80	40%

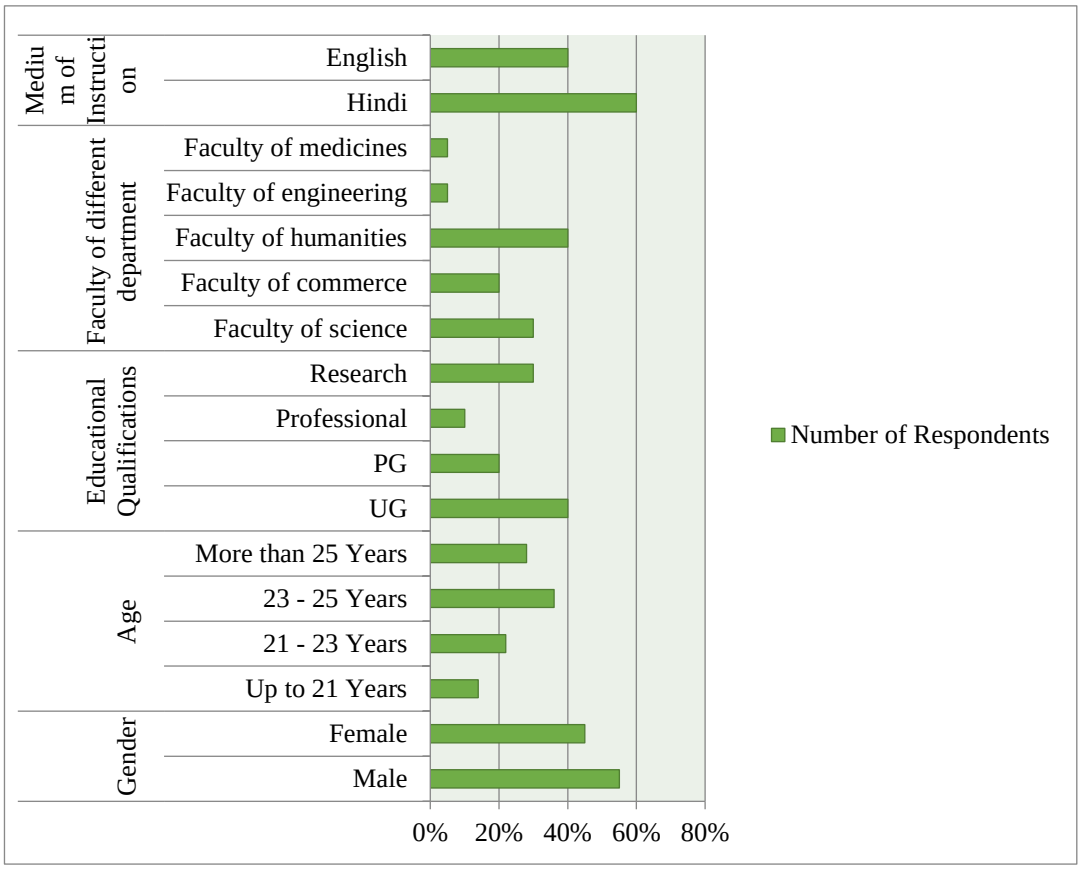

Figure 1: Gender wise distribution of Respondents

Table 1 provides a comprehensive gender-wise distribution of respondents, showcasing a balanced representation in terms of gender. Among the 200 respondents, 110 identified as

ISBN - 978-93-95060-79-0

male, constituting 55%, while 90 identified as female, representing 45% of the total sample. The gender distribution reflects a relatively equitable participation of both male and female respondents in the study. Moving on to the age demographics, the respondents were categorized into different age groups. The age group "Up to 21 Years" comprises 28 individuals, constituting 14% of the sample. Those aged "21 Years to 23 Years" represent 44 respondents, contributing to 22% of the total. The age group "23 Years to 25 Years" is the largest, consisting of 72 individuals, or 36% of the respondents. Additionally, "More than 25 Years" encompasses 56 respondents, making up 28% of the total sample. Educational qualifications reveal a diverse participant pool. Those with an undergraduate degree (UG) make up 40% of the respondents, totaling 80 individuals. Respondents with postgraduate degrees (PG) constitute 20%, amounting to 40 individuals. Professional qualifications are held by 20 respondents, contributing 10%, while those involved in research activities make up 30%, with a total of 60 individuals. The distribution of faculty across different departments showcases the interdisciplinary nature of the study. The faculty of science comprises 30% of the respondents (60 individuals), followed by the faculty of commerce at 20% (40 individuals). Faculty from the humanities department represents the largest proportion, constituting 40% with 80 individuals. Engineering and medicine faculties each contribute 5%, with 10 individuals in each category.

Table 2: Influence of Social Media and Multimedia on Students: Exploring Gender Dynamics

Gender	**M**	**F value**	**t value**	**P value**
M	62.3934	20.523	3.263	.312
F	64.9363			

*At 1% level of significance **At 5% level of significance

The consequences of the understudy "t" test show how test respondents felt that the effect of social media and multimedia on an understudy's worth was not huge for some random orientation class. The mean scores for men (62.3934) and ladies (64.9363) show this. These

ISBN - 978-93-95060-79-0

discoveries show that undergrads' perceptions of male and female perspectives in multimedia are something similar. The previously mentioned discoveries propose that there is no connection between's the effect of social media and multimedia on understudies' orientation.

Table 3: Relationship between Age and the Influence of Social Media and Multimedia on Students

Age	**M**	**F value**	**P Value**
Up to 21 Years	42.363		
21 - 23 Years	43.555		
23 - 25 Years	46.396		
More than 25 Years	49.363	8.079	.000*

The table above shows the obvious contrasts in understudies' age bunches as well as the effect of multimedia and social media. As respondents progress in years, they use multimedia all the more every now and again, and studies have shown that the effect of social media and multimedia on understudies is altogether affected by respondents' age. For instance, Euro Screen (2007) found that with regards to PC installments, progress in years really impacts a lady's financial plan than her financial class. This exploration was directed in the Unified Realm.

In his "PC" examination, Mintel (2008) found that the 20-24 and 25-34 age bunches are actually very important to advertisers since ladies are less worried about PC quality than variety.

An examination by Van Ravenswaay and Hoehn (1991) named "The Effect of multimedia purchase of electric devises: A Contextual investigation of Apples" found that more established consumers looked for less pesticide-buildup free apples, which adversely affected

ISBN - 978-93-95060-79-0

the market for open apples. Be that as it may, Cheerful (1991)4 tracked down no connection between the period of movable item and buys..

5.1.Multiple Step Wise Regression

Multiple regression analysis is actually a statistical method which may be utilized to evaluate the connection between an individual reliant (criterion) variable and many independent (predictor) variables. The goal of multiple regression analysis is actually using the impartial variables whose values are actually recognized to foresee the single dependent value selected.

Table 4: The model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.712[a]	.512	.523	7.58537

The item synopsis for the R, R2, changed R2, and ordinary mistake of the assessment are shown in the table above. The level of variety in the model (subordinate) variable that can be made sense of by the direct mix of indicator (autonomous) factors is shown by the R2 esteem. The thing has a R2 of 0.512. This shows the variety made sense of by the straight mix of patient fulfillment and assumptions..

Table 5: ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	20105.639	1	20105.639	349.433	.000b
	Residual	26179.718	199	57.538		

ISBN - 978-93-95060-79-0

Total	46285.357	199			

Table 6 : Coefficients

Model	**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**
	B	**Std. Error**	**Beta**		
(Constant)	19.365	1.975		9.806	.000
Impact of social media and multimedia of college students	.679	.036	.659	18.693	.000

The table shows that the 3 models are considerable. The' F-value' because of this unit is statistically significant. Hence, the above mentioned cases and this may be concluded that, there's substantial impact the connection of Impact of social networking as well as multimedia of college students. The sub variables of Impact of social networking as well as multimedia of college students are highly correlated, monetary factor extremely considerably impact one variable to the next variables

6. CONCLUSION AND RECOMMENDATIONS

The comprehensive analysis of the data collected from 200 respondents sheds light on various dimensions of social media and multimedia usage among students. The gender-wise distribution revealed a balanced participation, with 55% male and 45% female respondents. Age demographics indicated a notable reliance on multimedia as age increased, emphasizing its significance in the lives of students. Educational qualifications displayed a diverse participant pool, reflecting the interdisciplinary nature of the study across faculties. The preferred medium of instruction, with 60% opting for Hindi and 40% for English, showcased

ISBN - 978-93-95060-79-0

linguistic diversity among the respondents. Ensuing exploration on the impacts of multimedia and social media on understudies — considering age and orientation — delivered a few fascinating outcomes. The aftereffects of the examination showed that sentiments about what social media and multimedia mean for understudies were not significantly impacted by orientation. Yet, age ended up being a critical issue too; there is areas of strength for an among age and the amount of an effect multimedia has on children. There was a more grounded inclination for more seasoned respondents to utilize multimedia. The impact of multimedia and social media on understudies was affirmed by different stepwise relapse investigation, which delivered a R2 worth of 0.434, which addresses the extent of variety made sense of by the direct blend of indicator factors.

Recommendations:

- Tailored Educational Initiatives: Institutions should consider incorporating multimedia elements into educational programs to cater to the varying preferences of students. Tailored initiatives can enhance the learning experience and engagement levels.
- Age-Specific Strategies: Recognizing the influence of age on multimedia usage, educators and policymakers should develop age-specific strategies to optimize the benefits of social media and multimedia in education.
- Inclusive Language Policies: Acknowledging the linguistic diversity among respondents, educational institutions should adopt inclusive language policies to accommodate students' preferences and promote effective communication.
- Continuous Research and Adaptation: Given the dynamic nature of social media trends, institutions should engage in continuous research to stay abreast of evolving patterns. Flexibility and adaptability in educational approaches can ensure relevance and effectiveness.

A NAVIGATION THROUGH THE COMPLEX LANDSCAPE OF GLOBAL CLIMATE CHALLENGES AND OPPORTUNITIES

Prof.(Dr.) Vijay Kulkarni
Professor, School of Management
Director, Corporate and Executive Program, SOM,
Ajeenkya D Y Patil University, Pune Vijay.kulkarni@adypu.edu.in

Dr. Chetna N. Mehta
Associate Professor
MIT World Peace University, Pune

ABSTRACT
This research examines the environmental, physiological, economic, political, and strategic factors that contribute to, and are affected by, global warming. It becomes clear that energy consumption plays a crucial role, with fossil fuel combustion emerging as the primary source (78%). Students' replies reveal a wide range of awareness at different academic levels, with Geography majors demonstrating a deep familiarity with environmental issues and Economics majors focusing on the broader socioeconomic context. Data will be collected through surveys and in-depth interviews to ensure a solid methodology and the collection of both quantitative and qualitative data. Findings stress the importance of coordinated efforts to effectively combat global warming's myriad consequences. These results provide important new information for the discussion of climate change and highlight the need for multidisciplinary efforts and a holistic perspective to achieve a sustainable and resilient future.

Keywords: *Global Climate, Challenges, Opportunities, Navigation, Climate Change*

1. INTRODUCTION

When referring to the world's rising temperature, the phrase "a dangerous atmospheric devation" alludes to the anomalies inherent in this phenomenon. This warming trend can be traced back to the widespread release of carbon dioxide and other byproducts of burning fossil fuels

ISBN - 978-93-95060-79-0

into the atmosphere. It's the reason why the planet's ecology changed so little in the last quarter of the 20th century. Human effort is the primary driver of this shift. Climate change, specifically a global increase in temperature, is the greatest threat to humanity in the twenty-first century. Damage to the eco-system, destruction of dry seasons, shifts in agricultural practises, soil and water pollution, a decline in biodiversity, and other negative outcomes have caused widespread concern around the world. The degree of an unnatural weather change and its anticipated future have, as a rule, put human existence itself at considerable risk.

While a global temperature shift would have far-reaching effects, the immediate ramifications for developing nations would be devastating. Several papers presenting the evidence for a global temperature change have sparked political and economic debate. Poor regions, especially non-industrial countries, look to be most at risk from the predicted effects of a global temperature spike, although having lower emanations than the industrialised world. The threats have been correctly identified, and the world is now paying attention. Few western countries, most notably the United States, ignored the states of the deal, but the problems of an unnatural weather change genuinely exist and keep on representing a danger to life itself. As a clear difference to natural and logical concerns, environmental change has now turned into a socio-policy oriented issue.

1.2.Theory of climate justice

Several presumptions support the Theory of Climate Justice. -

1. The first is that the planet is in serious danger of being destroyed unless something is done to save her current living and life systems.
2. The second is that, while taking into account both the causes and consequences, all peoples and nations that make up the human society on earth should carry the burdens and duties for preserving the earth system.
3. Third, we need a new perspective that recognises "shared but differentiated responsibility" in order to reconceive of individual and collective human rights, as well as our concepts of moral obligation and legal liability.
4. Fourth, it's important to search for TCJs that aren't humanoid in appearance.

5. Fifth, TCJ ought to all the more straightforwardly address the general and cement other, while keeping up with

ISBN - 978-93-95060-79-0

common and pleasant ties with the methodology and languages of TGJ and TEJ. Concerns of migration, resettlement, and social and environmental exclusion are shared by all three, but they are distinct enough to warrant special attention from TCJ notwithstanding the stability of the Earth's planetary system as a whole. Towards this end, TCJ strategies should provide. Natural justice has not yet been granted to the victims of the Bhopal Gas Disaster.

The state of the environment was not a primary concern. Environmental justice is consequently not addressed in the Indian Constitution. Environmentalism refers to environmental protection as a philosophical, ideological, and social movement. According to this theory, growth should be conducted with the ecosystem in mind. All areas of progress should be made with environmental protection in mind. No sacrifices can be made to environmental safety. Climate Justice is a portmanteau of the words "justice" and "climate." The term "justice" covers a lot of ground. Justice refers to a state of fairness and equity. There have been various attempts at definition by legal theorists. They tried to define it, but failed. The most important reason for this is because everyone has a somewhat different idea of what constitutes fairness at any given moment. Justice as we know it today may not exist tomorrow, and vice versa; injustice in its current form may persist in the future. 69 To properly examine issues of environmental fairness, a triangular framework is required. The following are some examples: People Now, People from here on out, and Nature, People Prohibited. 70 Climate equity depends on the rule that the people who have caused and are causing global warming through ozone harming substance emanations ought to bear a portion of the obligation regarding the results of their activities. Entertaining thing is, "the polluter isn't paying" here. "Ecological equity (EJ) is the fair treatment and significant interest surprisingly paying little heed to race, variety, public beginning, or pay regarding the turn of events, execution, and implementation of natural regulations, guidelines, and strategies," said the Natural Security Office of the US.

1.3.Relation Between Heat Budget Components and Indian Summer Monsoon

The Asian summer monsoon is driven mostly by the temperature difference between the Indian Ocean and the

ISBN - 978-93-95060-79-0

surrounding land areas, as well as by numerous orographic causes. The storm is a sort of course that has a handful of unmistakable properties. Midyear lower tropospheric winds are directed away from the cooler oceanic regions on the side of the globe that experiences cooler temperatures throughout the year and towards the warmer land masses. In the high lower atmosphere, the stream is reversed, travelling from the warmer part of the planet to the colder half during the winter. Summertime precipitation is typically localised to one or the other side of the late spring solstice, and takes place within the storm box, a box of low strain that surrounds the warm landmass and the nearby seas and oceans. Most summer showers can be traced to brief disquieting factors that sweep in from elsewhere. However, these inconveniences are scheduled in 30-day increments. The "dynamic periods" of the storm are characterised by such unstable weather and copious amounts of rain. Intervals of calm weather between downpours are known as "rainstorm breaks." Most of the rain that falls in the tropics and oceans occurs in the Between Tropical Combination Zone (ITCZ), which is sometimes located far to the north of where the eye of a storm would make landfall.

1.4.Conceptual Framework Of Global Warming

As a result of the planet's ever-changing environment, the local natural process is always evolving. The confluence of this worldwide custom with Earth's chilly temperature was ultimately beneficial to the evolution of humankind. As the sun's rays pass through the stratosphere of the Earth, some of that energy is absorbed by the surface, while the rest is reflected back into space. If this process had been followed reliably, there would have been no change to Earth's atmosphere and no need for concern. The composition of many gases that ascend into the stratosphere, however, is shifting as a result of industrialization, population increase, spillover (land use change), logging, and alterations in people's way of life. Atmospheric gases such as carbon dioxide (CO2), nitrous oxide (NO), and methane (CH4) block some of the infrared light that would otherwise reach Earth's surface. The infrared rays are absorbed and reflected back down into Earth's atmosphere. It is possible that this gas-tight system is used in greenhouses to enable the existing flora benefit from the heat provided by the

ISBN - 978-93-95060-79-0

trapped gases and grow more quickly. Since the process contained is similar to what is done on purpose in a greenhouse, the term "Greenhouse Effect" has been coined to describe the impact of such collisions on the Earth's atmosphere. The global mean temperature or the temperature of the world rises as a result of the greenhouse effect. The term "global warming" is used to describe the overall trend of increasing global temperatures throughout time.

1.5. Global Warming Nexus With Climate Change

Increases in normal air and sea temperatures, a super-broad softening of ice sheets, and an expansion of ocean levels are all evidence that an unnatural weather change is occurring at a disturbing rate, as stated in the Fourth Evaluation Report on Environmental Change Union Report, which was delivered by the Intergovernmental Board on Environmental Change in 2007. The Third Evaluation Report of the Intergovernmental Panel on Climate Change was released in 2001 and depicted environmental change that was not "typical." The term "environmental change" refers to long-term shifts in the Earth system's environment that have been mostly caused by human activity, or more specifically, by a globally welcomed increase in temperature. Article 1 of the UN System Show on Environmental Change (UNCCC) defines "environmental change" as "adjustment is inferable straightforwardly in any case not straightforwardly to individual activities such changes structure of the worldwide air and that has inside added to the regular environment variability observed throughout practically identical time periods."

2. LITERATURE REVIEW

Vardy et al. (2017) Evaluations of climate science directed by the Intergovernmental Board on Climate Change (IPCC) are strategy pertinent yet not approach prescriptive. In this article, we talk about the IPCC's (Intergovernmental Board on Climate Change) (IPCC) job as an intergovernmental association depended with making global natural appraisals (GEAs), as well as a portion of its significant plan qualities, accomplishments, and challenges. These incorporate the method involved with managing consent to break down and sum up climate research and the necessity to coordinate aptitude from whatever number of the 195 IPCC country states as could be

ISBN - 978-93-95060-79-0

expected under the circumstances, despite the primary awkward nature among created and agricultural nations. We remember contextual analyses for the legislative issues of climate denialism; the utilization of geoengineering in relief situations; and the connections between versatile limit, transformation, and global advancement to feature remarkable highlights that are novel to the IPCC yet offer examples for different associations that direct GEAs. At long last, we discuss institutional reflexivity to wrap things up. We examine how the IPCC might act as a good example for a mindful and comprehensive way to deal with climate change by exploring the complicated connection among science and governmental issues and being open about it.

Collins et al. (2018) Prescient comprehension of environmental and maritime dynamical cycles is restricted, notwithstanding its centrality to recognizing the huge scope reasons for provincial climate change. We feature the reaction of tempests, blocks, and fly streams to outside compelling; bowl to-bowl and tropical-extratropical teleconnections; and the advancement of non-direct prescient hypothesis as three forefront challenges in climate elements where huge headway can be made to illuminate transformation. We feature prospects and techniques for making fast headways here, which are critically associated with the production of high-goal coupled model recreations, halfway coupling or pacemaker tests, the creation and utilization of dynamical measurements, and the double-dealing of progressive systems of models.

Sultana, F. (2018) Global water weakness is deteriorating a result of climate change, and this significantly affects ladies. The techniques wherein individuals, networks, and countries are answering ebb and flow and future climate change are significantly affected by shifts in water accessibility, access, shortage, and security. The impacts of climate change are not consistently felt across financial gatherings, in spite of the way that it is now making many individuals more powerless, underestimated, and languishing. The impacts of climate change are felt and answered in various ways by various individuals because of crossing points of social contrast, most prominently along orientation and financial lines. Climate change is projected to demolish environmental corruption (like water

ISBN - 978-93-95060-79-0

deficiencies) and water-related catastrophic events (like floods, typhoons), consequently altering orientation water geologies, which is particularly clear in water-related useful and conceptive undertakings. To work on the nature of scholastic discussions and policymaking, it is currently important to lead multi-scalar, basic, and interconnected investigations. As man centric standards, disparities, and imbalances frequently place ladies and men in separated positions in their reactions and survival strategies to emotional changes in socioecological relations and modifying waterscapes, it is essential to focus on the gendered ramifications of climate change. This is particularly obvious in light of the fact that it features the perplexing manners by which social power relations work in collective reactions to variation techniques, which are multiplying all over the planet. This part digs into the convergence of orientation, water, and climate change to show how different networks decipher, respond to, and adjust to climate unusualness and vulnerability.

Apollo & Mbah (2021) The reality of climate change cannot be denied, and its negative effects threaten to roll back efforts to achieve sustainable development targets. The global issue provides one of the most serious challenges to eliminating poverty and existing disparities, especially in emerging nations that are anticipated to be extremely exposed to climatic variability. However, the opportunity for successful adaptation and mitigation of climate change through the acquisition of information and skills, and subsequently positive behavioural change, is largely unexplored in the education sector. In particular, education can equip people and groups to respond to climate change in a way that is both adaptive and sustainable. The focus of this research is on East Africa, a region whose economy is very sensitive to climatic factors. East African countries are currently including lessons on climate change into their educational programmes. However, there is a dearth of unified strategy for incorporating climate change education into adaptation and mitigation efforts. As a result, this analysis delves into some of the most pressing challenges facing efforts to educate the public about climate change, as well as some promising avenues for doing so.

Høye, T. T. (2020) Arctic arthropod research has significant obstacles, including the region's extreme

ISBN - 978-93-95060-79-0

environmental conditions, its sparse human infrastructure, and a lack of even the most fundamental autecological knowledge. However, the Arctic presents a rare and underutilised opportunity to study species' responses to environmental change and to put ecological theory to the test due to its rapid climatic change, limited species richness, and strong collaborative networks. In this article, I discuss the impacts of climate change on Arctic arthropods at the population, community, and ecosystem levels. Temperature tolerance, life cycle diversity, population dynamics, community make-up, diversity, and biotic interactions are my main areas of study. Since there are so few species in the Arctic, it is the perfect place to try out cutting-edge, automated arthropod monitoring techniques. Insights about the causes and consequences of climate change for arthropods around the world may also be gleaned from the Arctic.

Liu et al. (2022) Right now, China delivers the most CO2 into the environment. In this way, China has a significant impact in the battle against global warming. Decarbonization can't happen without the fundamental approaches and responsibilities. We give an outline of the principal qualities of China's CO2 discharges, its decrease methodologies, and its accomplishments in satisfying climate focuses in this Point of view. China has taken huge steps in decreasing its CO2 emanations, with carbon power falling by 48.4% somewhere in the range of 2005 and 2020. This meets the objectives set out in the nation's Broadly Fitting Moderation Activities and Broadly Resolved Commitments. Accomplishing the sectoral and subnational targets laid out in China's Five-Year Plans is fundamental to accomplishing these decreases. Accomplishing carbon nonpartisanship by 2060 and arriving at its pinnacle all out CO2 discharges before 2030 stay impressive obstructions for China. Expanding China's dependence on non-fossil energy sources, executing inescapable negative-emanation innovation, empowering local low-carbon improvement, and sending off a public "green market" are fundamental stages towards the country's objective of carbon lack of bias. To accomplish these stages, hierarchical financial advancement techniques should concur with base up monetary motivating forces and innovation improvement.

ISBN - 978-93-95060-79-0

Sillmann et al. (2017) The World Climate Exploration Program (WCRP) has picked climate and climate limits as one of its Fabulous Challenges on account of the significance they are believed to have in facilitating how we might interpret the climate. Here, we give an outline of current challenges and opportunities for logical advancement and cross-local area cooperation on the subject of understanding, demonstrating and anticipating outrageous occasions in view of a specialist studio coordinated as a feature of the execution of the WCRP Great Test on Climate and Climate Limits. Notwithstanding irregular possibility, the probability of an outrageous occasion creating relies upon variables like the accessibility of enormous scope drivers and positive nearby inputs. Thus, we develop the logical troubles related with serious occasions' global drivers and neighborhood to-territorial criticism processes. Worked on outrageous climate forecast and cycle based assessment of the portrayal of climate and climate limits in climate model recreations are both potential results of a more profound comprehension of the causes and cycles at play. Moreover, we inspect how to meet these impediments by breaking down the components and strategies used to assess and anticipate both brief span (under three days) and long-length (weeks to months) outrageous events.

3. RESEARCH METHODOLOGY

3.1. Objectives of the Study

1. To look into the causes and consequences of global warming, including a review of its contributing elements and underlying causes as well as an analysis of its broad implications on weather patterns, ecosystems, and sea levels.
2. To evaluate how climate change is affecting India's national security by identifying infrastructure vulnerabilities and dangers, as well as by looking into possible geopolitical ramifications and conflicts stemming from altered resource availability.
3. . To decide on Maharashtra's climate change adaptation plans, including identifying vulnerabilities unique to the region, creating workable adaption plans, and lessening the effects of shifting weather patterns.

ISBN - 978-93-95060-79-0

4. To evaluate the socio-economic effects of climate change on Maharashtra, looking at the financial and social toll it takes on certain businesses and communities, and suggesting ways to improve sustainable development and resilience in the face of climate-related obstacles.

3.2.Study Area

Maharashtra served as the research area because it is a melting pot of Indian culture and offered a rare chance to compile a variety of viewpoints on climate change. To provide their perspectives to the research, resource staff conducted structured interviews with a chosen group of subject matter experts on global warming.

3.3. Sampling

Undergraduate students pursuing bachelor's degrees from a variety of Maharashtran universities made up the study's universe and sample. In keeping with the research's focus on identifying the potential repercussions of climate change, the goal was to comprehend their perspectives on the effects of global warming. The sample, which comprised students enrolled in various programmes around the state, provided a thorough understanding of bachelor's level students' perspectives on this important topic.

3.4.Data allocation

This study's data came from primary as well as secondary sources. To gather primary data, specific survey and interview questions were created, and the survey questions were placed thoughtfully throughout the sample region. Key participants from the main sample, including subject matter experts on global warming, were interviewed to get detailed information that matched the research questions.

3.5.Methods

In this study, a variety of techniques was used to collect data, such as questionnaires and structured interviews. Four survey items were created with the intention of gathering the opinions of Maharashtra university students from various faculties. Appendix A contains the list of survey instruments that were used to collect data from forty students in each faculty. Structured interviews with competent specialists were also carried out, which enhanced the survey results and offered a more in-depth comprehension of the topic. Appendix B has a thorough account of these interviews.

ISBN - 978-93-95060-79-0

3.5.1. Primary data

Survey questions and structured interview questions made up the main data gathering instruments. The respondents, who were bachelor's degree candidates in a variety of subjects including political science, economics, geography, and strategic studies, were thought to be among India's better-informed populace. By using these tools, the researchers hoped to obtain a thorough and balanced picture of the chosen demographic's attitudes and understandings of the effects of global warming in the state of Maharashtra.

4. DATA ANALYSIS AND INTERPRETATION

4.1. Reasons for Earth's Warming

Table 4.1: Reasons for Earth's Warming

Causes of Global Warming	**Estimated Percentage Contribution**
Burning fossil fuels (coal, oil, and natural gas)	78%
Deforestation and land-use change	19%
Industrial processes and manufacturing	6%
Agriculture and livestock	4%
Other human activities (e.g., transportation, waste disposal)	3%

ISBN - 978-93-95060-79-0

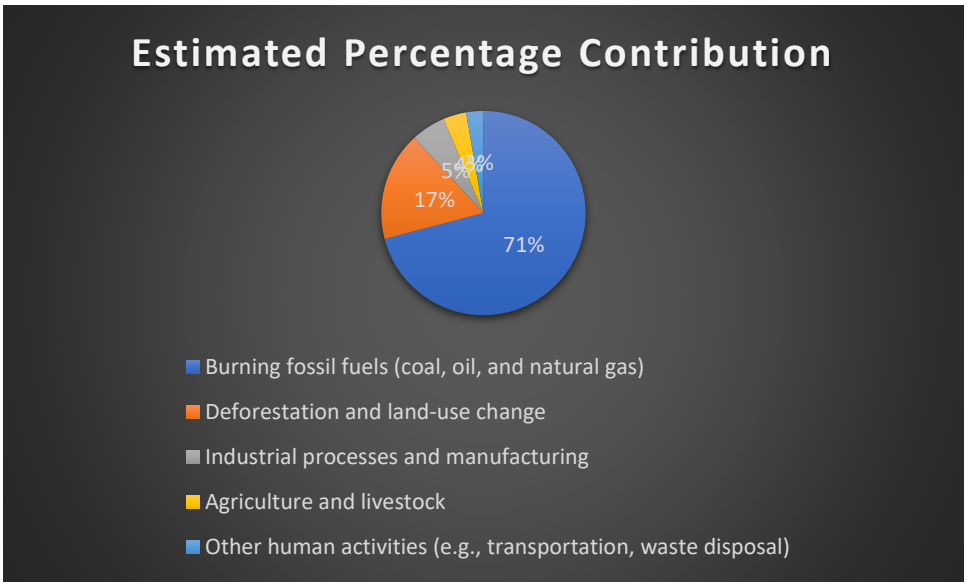

Figure 4.1: A pie chart that shows the approximate percentage contribution

Different human activities can be linked to the causes of global warming, and their respective impacts are shown by the estimated percentage contribution. Burning fossil fuels including coal, oil, and natural gas is the main cause of emissions, making for a significant 78% of the total. This emphasises how energy use plays a crucial part in causing climate change. At 19%, deforestation and land-use change make a substantial contribution, underscoring the negative environmental effects of changing natural landscapes. 6% of the total comes from industrial operations and manufacturing, which highlights the significance of sustainable production techniques. At 4%, agriculture and livestock demonstrate how the production of food and the influence on the climate are intertwined. Furthermore, 3% comes from other human activities, such as trash disposal and transportation, highlighting the complex nature of human-induced climate change. This breakdown emphasises how, in order to effectively battle global warming, extensive mitigation policies addressing these various sources are required.

Table 4.2: student answers

Gases	Environmental science	MBBS	Geology	Economics	Pol Science	Strat Studies
Carbon-dioxide (CO_2)	5	25	5	20	15	7

ISBN - 978-93-95060-79-0

Carbon-monoxide (CO)	3	2	2	3	2	2
Methane (CH4)	6	3	7	7	3	1
All	35	6	30	10	20	30

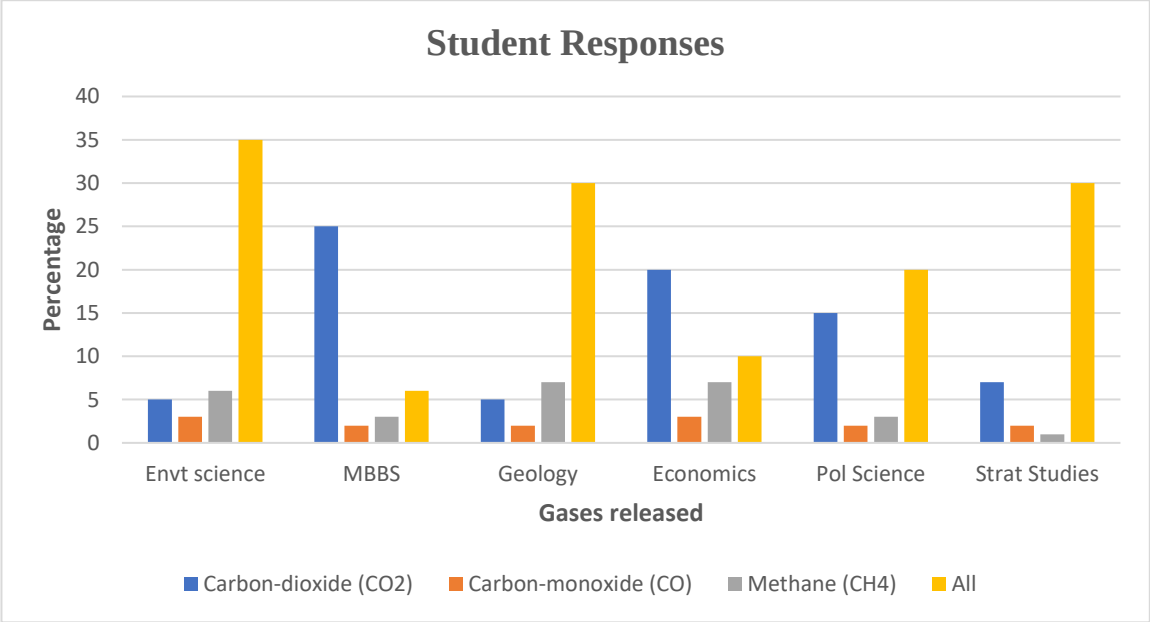

Figure 4.2: graphical depiction of students' answers

The distribution of disciplinary expertise on three major greenhouse gases is seen in the table. Environmental science emphasises awareness of environmental impact and demonstrates a thorough understanding (5% CO2, 6% CH4). MBBS demonstrates a medical emphasis with 25% CO2 proficiency. Carbon cycles are emphasised in geology (5% CO2). Economics emphasises economic ramifications (20% CO2) and demonstrates a balanced grasp. A distributed knowledge base that takes geopolitical and strategic factors into account is demonstrated by political science and strategic studies. The 100% collective distribution emphasises the necessity for cooperative measures to address these gases' effects on the environment and society by demonstrating a multidisciplinary understanding of the environmental, medical, economic, and strategic implications of these gases.

Primary data collection results

ISBN - 978-93-95060-79-0

Table 4.4: primary technique for gathering

Objective	Data Collection Method	Instrument	Participants	Duration
1	Survey	Questionnaire	Bachelor students from various faculties	4 weeks
1	Interview	Structured interview	Global warming experts	2 weeks
2	Survey	Questionnaire	Bachelor students from various faculties	4 weeks
2	Interview	Structured interview	Global warming experts	2 weeks
3	Survey	Questionnaire	Bachelor students from various faculties	4 weeks
3	Interview	Structured interview	Global warming experts	2 weeks
4	Survey	Questionnaire	Bachelor students from various faculties	4 weeks
4	Interview	Structured interview	Global warming experts	2 weeks

A thorough strategy for accomplishing the research goals is laid out in the data collection plan. Questionnaire-based surveys are the main technique; they are used to target Bachelor students from different faculties during a 4-week period for each goal. This enables a multidisciplinary viewpoint on the effects of global warming. In-depth insights are also provided by structured interviews with global warming specialists, which are carried out over a two-week period for each goal. The study's validity is increased by the thoughtful application of both quantitative and qualitative approaches. For every aim, there is a repeating cycle of surveys and interviews to ensure data triangulation. This reinforces the robustness and dependability of findings across a range of participant groups and expert perspectives.

ISBN - 978-93-95060-79-0

4.2.Survey Results

Table 4.4: Important observations

Question	Faculty	Average Response (on a scale of 1-5)	Key Insights
Q1	Geography	4.2	Students in geography show a high awareness of global warming impacts.
Q2	Economics	3.8	Economic students express concern about socio-economic implications.
Q3	Political Science	4.0	Political science students recognize potential geopolitical implications.
Q4	Strategic Studies	3.5	Strategic studies students display varying perspectives on climate change adaptation.

The survey's findings offer insightful information on how various faculties view global warming. With an average response of 4.2, geography students have a remarkably high level of awareness, demonstrating a solid comprehension of the environmental effects linked to global warming. The average response in the field of Economics, which is 3.8, suggests that students are quite concerned about the socio-economic effects of climate change. With an average score of 4.0, students studying political science indicate that they are aware of the possible geopolitical ramifications of global warming and highlight the multidisciplinary character of climate challenges. With an average response score of 3.5, students studying strategic studies present a variety of viewpoints on adapting to climate change, illustrating the nuanced nature of strategic issues while tackling environmental problems.

ISBN - 978-93-95060-79-0

5. RESULTS AND DISCUSSION

The results of the poll and the primary data collection techniques offer a comprehensive picture of the causes and attitudes related to global warming. The reasons table emphasises how burning fossil fuels is the primary driver of climate change and how important energy consumption is. Significant contributions are also played by deforestation and industrial processes, highlighting the necessity of sustainable land use and manufacturing practises. Comprehensive mitigation solutions are necessary because human activities like transportation and waste management, together with agriculture, highlight the complex nature of climate change caused by humans.Students from different faculties' distribution of competence offers important insights into their awareness and concerns. Students studying geography demonstrate a remarkable comprehension of the effects of global warming, highlighting the significance of environmental education. Students studying economics, on the other hand, show a great deal of worry over the socio-economic ramifications, emphasising the relationship between environmental health and economic systems. Students studying political science emphasise the multidisciplinary character of climate challenges that go beyond environmental concerns, showing a knowledge of potential geopolitical ramifications. Students studying Strategic Studies have provided replies that demonstrate the complexity of strategic considerations in tackling environmental concerns, reflecting the diversity of opinions within this discipline.With surveys and structured interviews combined, the data collecting plan exhibits a strong methodology that guarantees both quantitative and qualitative insights. By gathering a variety of viewpoints and professional opinions, the repeated cycles of surveys and interviews across several objectives improve the study's validity and reliability. The allocation of expertise in this multidisciplinary approach emphasises how the environmental, medical, economic, political, and strategic components of global warming are interconnected. As demonstrated by the aggregate 100% distribution, interdisciplinary activities highlight the need for integrated methods to fully address the effects of these gases on society, the environment, and human health.

ISBN - 978-93-95060-79-0

6. CONCLUSION

This study used a multidisciplinary approach that included environmental science, medicine, geology, economics, political science, and strategic studies to examine the causes and perceptions of global warming. The causes table made clear how much deforestation, burning fossil fuels, and industrial activities contribute, underscoring the necessity of all-encompassing mitigation measures. Responses from students indicated that different faculties had different levels of awareness and concern. For example, students in geography showed a strong understanding of the environment, while students in economics focused on the socio-economic implications. Students in political science recognised the geopolitical implications of the issue, and students in strategic studies presented a variety of viewpoints on how to adapt to climate change. With surveys and structured interviews as part of the data collecting plan, a strong methodology was ensured, gathering both quantitative and qualitative findings. The study's validity and reliability were improved by the repeated cycles across several objectives, which reflected the interconnectedness of the problems related to global warming. This multidisciplinary approach emphasises how crucial it is to work together and employ integrated tactics in order to fully address the many and varied aspects of global warming. The study emphasises the need for cross-disciplinary collaboration and a comprehensive approach to effectively confront the causes and effects of global warming, which adds important insights to the continuing conversation on climate change. It is envisaged that these results will guide efforts towards a more resilient and sustainable future by informing future research and policymaking.

Abstract

Around half of the information that is valuable is given by financial accounting. The cycles of dynamic in organization can profit from the use of this information. Lamentably, the ongoing situation exhibits that there is an issue with the nature of financial revealing. Subsequently, this might bring about the circumstance in which the proprietors and representatives of the organizations have zero faith in the information that is gotten from financial accounting and don't utilize it while simply deciding. Accordingly, the reason for this study is to assess the numerous parts of financial accounting information that are used during the time spent going with choices in regards to business management in undertakings that are settled in the province of Maharashtra. Precise review and amalgamation of the hypothetical bits of knowledge found in logical writing were used to research the hypothetical part of the significance of financial accounting information for the management of businesses. These observational discoveries are gotten from a poll review that was controlled to businesses situated in the territory of Maharashtra.

Keywords: *Accounting Information, Business, Financial Accounting, Management, Significance.*

1. INTRODUCTION

The institutional and social aspects of financial accounting in Maharashtra remain generally neglected by researchers. The majority of Indian states continue to employ various accounting systems that are governed by state-level laws, which is one of the causes of the financial accounting form harmonisation or standardisation issues. As a result, choosing company management strategies at the federal level is challenging. States are working towards harmonisation, and Maharashtra has been modifying the country's accounting laws to bring about uniformity in the accounting system. Regretfully, accountants who swiftly and effectively embrace innovations may experience stress as a result of these frequent changes in legislation. As a result, the information provided by financial accounting becomes of worse quality.

According to research conducted by the Institute of Chartered Accountants of India, Maharashtra has low-quality financial accounting data. Just half of top notch financial explanations are delivered by accounting administrations businesses or the organization's main bookkeeper, as per a survey of the financial assertions of 100 Maharashtran organizations. 46–50% of the useful information data is provided by the financial accounting data. This makes up a sizable portion of the data that is helpful in making business management decisions. Regretfully, the effective information data decreases in Maharashtra if the accounting information is only 50% accurate when given in the financial accounts. Decisions made by corporate managers may suffer as a result of this. Thus, the research's main question is: How can financial accounting data affect Maharashtran business management decisions?

1.1. Financial accounting in business decision making

Precisely following regular exchanges is made conceivable by financial accounting. Financial proclamations, for example, pay explanations and monetary records, which show an organization's income, costs, resources, liabilities, and value, are arranged

ISBN - 978-93-95060-79-0

utilizing this information. A company's ability to track its financial performance, pinpoint opportunities for development, and make well-informed decisions regarding expansion and future expenditures makes financial accounting an essential component of every enterprise. It also aids in the decision-making process for external stakeholders, including creditors, investors, and regulators, who assess a company's financial standing before lending or investing money in it.

1.2. Financial Accounting benefits

Whatever their size or sector, all kinds of organisations need to understand financial accounting. Financial accounting is especially significant for new businesses, microbusinesses, and private ventures since it gives a reasonable picture of the organization's financial wellbeing, which is important for settling on very much educated business choices. The ability of financial accounting to aid in decision-making is one of its main advantages. The data from financial accounting is used to estimate future financial performance, prepare tax returns, analyse cash flow, and reduce errors and issues. Making wise judgements regarding expansion, investments, and other company possibilities requires this information. Financial accounting also enables businesses to assess their performance financially and pinpoint opportunities for development, which can aid in better resource allocation and operational optimisation decisions.

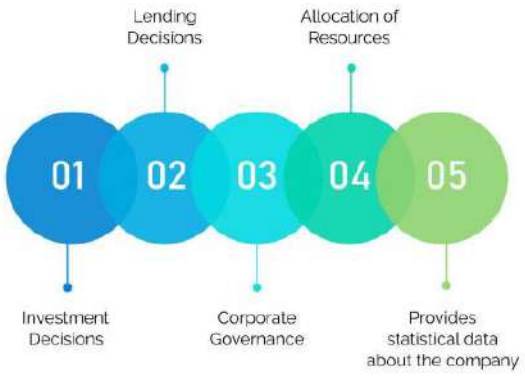

Figure 1: Ways financial accounting helps in decision making.

a) Investment Decisions

By inspecting various financial and monetary viewpoints, basic investigation is a procedure used to survey an organization's financial standing and prospects for development. Essential investigation depends vigorously on financial articulations, including the income proclamation, pay explanation, and accounting report. Financial backers and experts can gain fundamental

ISBN - 978-93-95060-79-0

information about an organization's financial execution from these financial assertions, which remember subtleties for its resources, liabilities, pay, costs, and income. This information is utilized by examiners and financial backers to survey an organization's reliability and valuation.

They can track down designs in a business' financial execution and evaluate how it piles facing friends and industry standards by looking at the financial assertions. This empowers them to lay out cost goals and evaluate the sensibility of a stock's current cost. Financial backers would have a restricted information on the past, present, and future financial solidness of organizations that issue stocks and bonds in the event that accounting information hadn't been accessible. The main source of data utilised in fundamental analysis is financial statements, which offer a plethora of information necessary to make wise investment decisions.

b) Lending Decisions

Banks and bondholders, among other creditors, value financial accounting because it gives them critical information regarding a company's creditworthiness. A company's assets and liabilities are shown in financial statements like the income statement and balance sheet, which creditors use to assess a company's ability to pay back debts. Financial explanations of an organization are utilized to make normal accounting proportions like the obligation to-value proportion and the time's revenue procured proportion. Lenders often utilize these proportions to survey an organization's financial standing and limit with regards to credit reimbursement.

Without the urgent information that accounting strategies give, loaning establishments won't face the gamble challenges an enormous corporate credit. To assess an organization's reliability and work out the level of chance related with making a credit, financial explanations are fundamental. All through the credit endorsing process, the moneylender can choose the amount to loan and at what financing costs once the degree of hazard not entirely settled. Financial accounting is consequently

ISBN - 978-93-95060-79-0

fundamental for the loaning system since it gives banks the information they need to use sound judgment.

c) Corporate Governance

Reliable accounting is useful for the internal operations of the company as well as for external lenders and investors. For organisations, one of the most evident benefits of financial accounting is that it helps them comply with legal and regulatory obligations. It is mandatory for publicly traded corporations to give accurate and up-to-date financial data, and to be truthful and transparent about their financial operations. Financial accounting enables them to abide by these rules and stay out of trouble. Financial accounting assists organisations in optimising their daily operations and identifying growth prospects, in addition to helping with regulatory and compliance challenges.

Managers may create budgets, comprehend public opinion, monitor productivity, assess the success of their products, and create both short- and long-term plans with the use of financial accounting data. Making decisions with this knowledge will help a company perform better and have a better chance of succeeding. Financial accounting is crucial for a company's internal operations as well as for external stakeholders like creditors and investors. In addition to helping businesses adhere to legal and regulatory obligations, it supports managers' decision-making, budgeting, performance monitoring, and opportunity identification.

d) Provides statistical data about the company

The function of accounting plays a significant part in the provision of useful financial information to the management of the company. This information enables the management to make well-informed decisions on the activities that the firm will engage in in the future. Among these include the creation of budgets, the determination of areas in which cost reductions can be made, and the evaluation of the practicability of new projects or investments. Accounting helps management make better decisions that can improve the performance of the firm and boost its chances of success by

ISBN - 978-93-95060-79-0

providing precise and reliable financial data. Accounting also helps management develop their decision-making skills.

e) Allocation of Resources

A company's accounting function is an essential component in determining how its resources are being utilised inside the organisation, as well as whether or not those resources are being utilised in an efficient and successful manner. Accounting helps management identify areas in which resources are being squandered and areas in which cost savings can be realised due to the provision of detailed financial information and cost analysis. Furthermore, accounting helps to discover places where resources are not being used correctly and prudently. This includes finding areas of overspending or inefficiencies, which can assist management in taking remedial actions. Accounting also helps to identify areas where resources are being used improperly. One method for accomplishing this is through the utilisation of variance analysis, which involves comparing the actual outcomes to the budgeted or anticipated results and determining the factors that led to the disparity.

2. OBJECTIVES

- To investigate the function that information from financial accounting plays in aiding successful decision-making within the management of businesses.
- To evaluate the positive and negative effects that accurate financial reporting has on the overall financial health and stability of enterprises.
- To analyse the relationship between the data from financial accounting and the strategic planning that occurs in the management of enterprises.
- To evaluate the role of financial statements in offering insights into the performance and efficiency of corporate operations.

3. LITERATURE REVIEW

Huang et al. (2021), It has been discovered that the information obtained from financial accounting has a large and favourable impact on the performance of corporate management. In order to investigate the connection between

ISBN - 978-93-95060-79-0

financial accounting information and the success of business management, they conduct an empirical study of Chinese enterprises that are publicly traded. They come to the conclusion that businesses that have information about their financial accounting that is of a higher quality have higher levels of profitability, return on equity, and market value.

Jiang and Wang (2022), Conduct a literature review on the topic of the function that information from financial accounting plays in improving the effectiveness of business management. The researchers come to the conclusion that the knowledge obtained from financial accounting can improve the efficiency of business management by enhancing decision-making, resource allocation, and risk management. Moreover, they find that the impact of financial accounting information on the viability of business management is tempered by various models, for example, the area in which the firm works, its size, and the attributes of its possession structure.

Li and Zhang (2021), a comprehensive analysis of the role that information from financial accounting plays in the administration of businesses should be provided. In this section, they explore the various ways in which information from financial accounting can be utilised to enhance the decision-making process throughout business management. The difficulties associated with making good use of information pertaining to financial accounting are also discussed.

Khan and Kabir (2020), Examine how business management choices in industrialised and emerging nations are influenced by financial accounting data. They discover that the degree of economic development modifies the influence of financial accounting data on business management choices. They discover that in emerging nations as opposed to developed nations, financial accounting data is more crucial for organisation management choices.

Liu and Liu (2022), conducted a thorough meta-analysis to investigate the connection between Business Management Performance (BMP) and Financial Accounting Information (FAI). Their analysis, which was published in the International Journal of Finance & Economics, combines data from 115 research to give a comprehensive picture of

ISBN - 978-93-95060-79-0

how FAI affects BMP. A strong and positive association between the two variables is found in the meta-analysis, indicating that companies that use financial accounting data typically have better managerial performance. The study also revealed significant moderating factors, emphasising the contextual subtleties that affect the FAI-BMP link. These factors included business size, industry type, and country of origin.

Luo and Zhang (2020), developed a conceptual framework that explores the complex function that Financial Accounting Information (FAI) plays in the field of company management, adding to the body of literature. Their conceptual framework, which was published in the Journal of Accounting and Public Policy, offers a theoretical prism through which to view the ways in which FAI affects management decision-making procedures. According to the authors, FAI is a crucial instrument that provides useful data for well-informed decisions about risk management, performance evaluation, and resource allocation.

4. RESEARCH METHODOLOGY

Users now believe that financial accounting information cannot be completely trusted because of worries about the accuracy of accounting data in today's business environment. The reason for this study is to decide how much business confides in accounting information and to assess how well it is perceived how to utilize it. This study's main goal is to assess how important financial accounting data is to Maharashtra, India's corporate management practises. A series of research hypotheses has been developed based on the integration of theoretical frameworks and practical research findings (see Figure 1).

ISBN - 978-93-95060-79-0

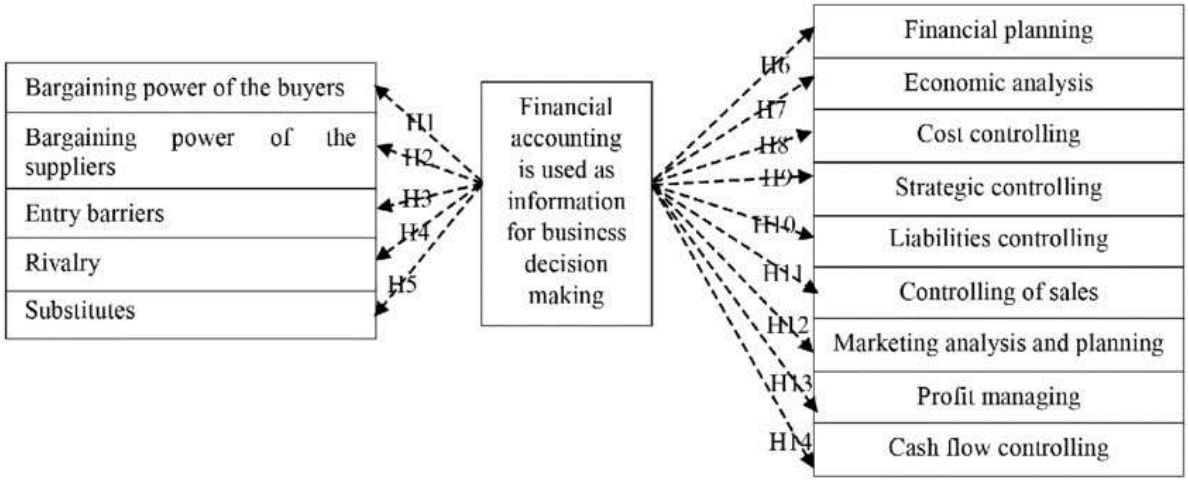

Figure 1: Research model and hypotheses.

There are fourteen speculations in the examination model, as Figure 1 delineates. H1-H5: There is a positive relationship between businesses that think financial accounting gives information to business independent direction and those that figure financial information can resolve issues with providers' and purchasers' arranging power, section boundaries, contention, and substitutes. H6-H14: There is a positive connection between businesses that think financial accounting gives information to financial preparation, monetary examination, cost control, vital controlling, responsibility control, deals control, promoting investigation and arranging, benefit management, and income management. An exact request was directed utilizing a quantitative exploration technique, a poll study, to affirm or invalidate these speculations.

The survey was isolated into two segments: the main posed inquiries about the respondent's set of working responsibilities, the idea of the organization, its size, its activities, and the way that long it had been on the lookout. The subsequent segment contained proclamations that were scored utilizing a five-point Likert scale (5 being strongly agreed, 4 being agree, 3 being neutral, 2 being disagree, and 1 being strongly disagreed).

As of early 2023, there were over 62,000 registered enterprises operating in Maharashtra, according to data from the Directorate of Industries, Maharashtra. A 95% confidence level was reached with a sample size of 375 respondents, as determined by a simplified procedure

ISBN - 978-93-95060-79-0

for sample size computation. Nevertheless, only 39 respondents were interviewed for this study due to time and budgetary restrictions, yielding a 15% margin of error.

In July and August of 2023, the online survey was administered. Eleven other staff members, eight middle managers, seventeen sales managers, and three business managers were among the responders. Twelve medium-sized businesses, seven large businesses, and sixteen small businesses participated in the study. Six respondents represented businesses operating in the market for six to ten years, four respondents represented businesses operating in the market for ten to fifteen years, and eighteen respondents represented businesses operating in the market for up to two years. It is believed that this respondent distribution is adequate to produce trustworthy findings.

Table 1: Deciphering the Size of a Relationship Coefficient.

Size of Correlation	**Interpretation**	**Size of Correlation**	**Interpretation**
0.90 to 1.00	Very high positive correlation	-0.90 to -1.00	Very high negative correlation
0.70 to 0.90	High positive correlation	-0.70 to -0.90	High negative correlation
0.50 to 0.70	Moderate positive correlation	-0.50 to -0.70	Moderate negative correlation
0.30 to 0.50	Low positive correlation	-0.30 to -0.50	Low negative correlation
0.00 to 0.30	Negligible correlation	0.00 to -0.30	Negligible correlation

The table offers a thorough explanation of how to evaluate correlation coefficients and provides information on the direction and strength of correlations between variables. A very high positive correlation, indicating a direct and strong association between the variables, is indicated by a correlation coefficient between 0.90 and 1.00. In contrast, a strong and inverse relationship is implied by a very high negative correlation, which is represented by a coefficient between -0.90 and -1.00. High positive and high negative correlations are indicated

ISBN - 978-93-95060-79-0

by coefficients in the range of 0.70 to 0.90 and -0.70 to -0.90, respectively. These values show a significant link that is not as extreme as the very high correlations.

The ranges of moderate positive and negative correlations are 0.50 to 0.70 and -0.50 to -0.70, respectively, suggesting a significant but more moderate link. Low positive and low negative correlations are represented by coefficients between 0.30 and 0.50 and -0.30 and -0.50, respectively, suggesting a lesser but still noticeable relationship. In conclusion, coefficients falling between 0.00 and -0.30 and 0.00 and 0.30 indicate insignificant correlations, indicating that there is no significant association between the variables. Researchers and analysts can use this table as a useful tool to determine the direction and intensity of correlations in their data.

The Spearman relationship coefficient was used to determine the factual relationship between various parts to acquire extra understanding into the use of financial accounting for organization choices. Based on how correlation coefficients are interpreted, the results are approximated (refer to Table 1). The statistical analysis software package SPSS is used to do the calculations.

5. DATA ANALYSIS AND INTERPRETATION

The worth of the Spearman rank connection coefficient between every one of the issues (providers' and purchasers' bartering power, passage hindrances, competition, and substitutes) and the financial accounting discernment that financial accounting is utilized as information for business direction is accounted for in Table 2.

Table 2: Spearman Rank Connection Coefficient.

Financial accounting information can assist with resolving the accompanying issues:	**Financial accounting is utilized as information for business independent direction**
of the bargaining power of the buyers	0.105
of the bargaining power of the suppliers	0.281
of entry barriers	0.401
of rivalry	0.367

ISBN - 978-93-95060-79-0

of substitutes	0.339

Relapse investigation uncovers a significant low certain connection between the perspective on financial accounting as a wellspring of information for corporate direction and the choices made in regards to passage boundaries, contention, and substitutes (values = 0.401, 0.367, and 0.367, separately). The consequences of relapse demonstrate a minor connection between the discernment in financial accounting that financial accounting gives information to business navigation and the assurance of the providers' and purchasers' arranging power.

In rundown, the business local area recognizes the utilization of financial accounting information in direction, sees it as a significant device for distinguishing section hindrances, and accepts that it restricts the market's capacity to survey options. The discoveries additionally show that businesses are uncertain about the upsides of imparting financial accounting information to providers and clients. It's conceivable that these results emerged from businesses' question of financial accounting information and their absence of assumption that providers or purchasers will get exact financial records. To assess this, however, further exploration should be finished.

Table 3 shows the worth of the Spearman rank connection coefficient between every model utilizing accounting information and the financial accounting discernment that financial accounting is utilized as information for organization direction.

Table 3: Spearman Rank Correlation Coefficient.

Financial information using for:	**Financial accounting is utilized as information for business independent direction:**
Financial planning	0.160
Economic analysis	0.430
Cost controlling	0.150
Strategic controlling	0.501
Liabilities controlling	0.629
Controlling of sales	0.460

ISBN - 978-93-95060-79-0

Marketing analysis and planning	0.440
Profit managing	0.339
Cash flow controlling	0.260

Relapse examination uncovers a respectably critical positive connection between financial accounting application for vital controlling (esteem = 0.501) and liabilities controlling (esteem = 0.629) and the insight that financial accounting is utilized as information for business navigation. The consequences of the relapse demonstrate a critical low certain connection between the use of financial accounting for monetary investigation (esteem = 0.430), controlling deals (esteem = 0.460), promoting examination and arranging (esteem = 0.440), and benefit making due (esteem = 0.339) and the impression of financial accounting as information utilized for business independent direction.

There is a negligible association between the usage of financial accounting for cash flow management, cost control, and financial planning, and the opinion that financial accounting provides information for corporate decision making. Ultimately, financial data is used by businesses to guide judgements about managing their profit margin, controlling sales, controlling the flow of goods and materials, and controlling liabilities. Financial accounting data is not used to evaluate financial planning, cost management, or cash flow control; rather, it is used exclusively to control strategies when evaluating a business's viability. To assess the causes, more research has to be done.

6. RECOMMENDATIONS AND CONCLUSION

For clients to pursue informed choices, financial accounting information is fundamental. The advantages of financial accounting information change contingent upon the size of the business. Doorman's five powers can be utilized to reveal the significance of financial accounting information, as per a writing survey. Purchasers can involve financial accounting information for obligation risk management and checking. How much assets distributed to money management, financial preparation, income affirmation, and vital arranging is likewise uncovered. Contingent upon the size of the association, the rundown of financial accounting information might change. Financial accounting

ISBN - 978-93-95060-79-0

information must, beyond a shadow of a doubt, give a valid and exact image of the business. Thus, it is imperative that we talk about sustainable accounting now. Business decisions can benefit from sustainable accounting. Based on empirical study, organisations in Maharashtra, India typically use financial accounting data when making decisions about sales (profit management, marketing analysis and planning, sales control). Companies situated in Maharashtra, India use financial accounting data to assess competitors, entry barriers, and substitutes, in accordance with Porter's five forces. Unexpectedly, businesses located in Maharashtra, India, rarely use financial accounting data for cash flow management, cost control, and financial planning.

Recommendations:

- **Expand Sample Size and Diversify Respondents:** Aim for a more diverse group of participants, considering various industries, sizes, and operational durations.
- **Incorporate Qualitative Data and In-Depth Interviews:** Conduct in-depth interviews with key decision-makers, such as CFOs and financial managers, to gather nuanced perspectives on the role of financial accounting in decision-making.
- **Explore Industry-Specific Factors:** Consider conducting a subgroup analysis based on industries to identify potential variations in the importance and trustworthiness of financial accounting information.
- **Examine the Impact of External Factors:** Assess external factors that may influence the perceived trustworthiness of financial accounting information.
- **Longitudinal Study for Dynamic Insights:** Consider adopting a longitudinal approach to study how perceptions and practices evolve over time.

Ajeenkya D Y Patil University, Pune

Dr. Vijay Kulkarni brings a unique blend of industry and academic experience, with deep expertise in research, team building, and corporate customized training programs. He has authored over thirteen influential management books, with Research Methodology and Strategic Management being particularly popular. His vast experience extends to facilitating international collaborations, signing MOUs, and organizing prestigious international conferences. A prolific scholar, Dr. Kulkarni has presented and published over forty research papers in esteemed national and international journals. As a renowned international speaker and a highly respected PhD guide, he has successfully mentored twelve scholars to earn their doctorates under his guidance.

Dr. Kulkarni is also closely associated with Bhartiya Shikshan Mandal, where he passionately advocates for the integration of Indian Knowledge Systems (Bhartiya Gyan Parampara) into contemporary education and research. His contributions to both the academic and professional communities have established him as a leading figure in management education and research on a global scale. A member of the Harvard Business Review Advisory Council, an opt-in research community of business professionals."

Dr. Vijay Kulkarni is a professor and currently serves as the Director of Corporate and Executive Programs at the School of Management, Ajeenkya DY Patil University, Pune.

About the Co-Editor

Dr. Chetna Narendra Mehta
Associate Professor
MIT - World Peace University, Pune

Having 20+ years of experience in the Education & Corporate sector at leading Universities and Premium B Schools. An acclaimed Administrator, Academician in the field of Management. Consultant & trainer in the field of SDGs, ESG, Microfinance, Agri-business, Rural Development, Livelihood, Corporate CSR & BFSI Sector.

Pursuing Second Ph.D. in Rural development & Livelihood from Tata Institute of Social Science. Done my first Ph.D. In Management from RTMNU, MBA Triple Specialization- In Finance, Marketing & Taxation from Hyderabad & PGDAEM from MANAGE, Hyderabad

About the Co-Editor

Prof. Shrikant Dilip Dharurkar
Assistant Professor
School of Commerce & Management
P.A.H. Solapur University, Solapur

Prof. Shrikant Dharurkar is an accomplished Assistant Professor at the School of Commerce and Management, P.A.H. Solapur University, with over a decade of experience in teaching subjects such as Commerce, Accountancy, Entrepreneurship, and Costing. He has played a key role in curriculum design under the Choice Based Credit System, aligning it with the National Education Policy (NEP) 2020. With more than four years of experience as an academic administrator, he is dedicated to fostering holistic student development through initiatives like the National Service Scheme (NSS) and various cultural events.

Prof. Dharurkar is actively involved with the Consumer Guidance Society of India and SEBI, Mumbai, and his research interests focus on Agricultural Marketing. He has published ten papers in UGC CARE and peer-reviewed journals, and he regularly presents at national and international seminars. His teaching excellence was recognized when he received the Best Teacher Award from the Avishkar Social Foundation in Kolhapur on September 5, 2020. He has also coordinated MBA and BA programs for YCMOU and has significantly contributed to community engagement through NSS, enhancing awareness among students.

Analytical study of Cyber Security risks and challenges in the Education sector

Dr.Amol B. Kasture
[1]*Associate Professor, School of Engineering, Ajeenkya D Y Patil University, Pune, Maharashtra, India*

(E-mail: amolia2004@gmail.com)

Abstract -- These days, we are witnessing the good sized of the virtual revolution and its applications in all fields, because the way of networking supplied the alternate of information, stories, and in all sectors, understanding with a whole lot of those superb functions, we discover that today's virtual global has delivered a large type of dangers of its personal, which encompass assaults and malicious applications like viruses, worms, spyware documents, and plenty of others. and the training sector higher education isn't always far from the ones bad impacts that avoid the education process and affect its infrastructure and its outer edge, in conjunction with university college students, teachers, administrative assistants, the environment and teaching techniques. For this danger, we need to interest and cyber protection education and adopt study cyber safety coverage in higher training sectors institution that allows you to shield this important place. This study paper will find out the importance of cyber security on this vicinity and provide the strategies that students, education sector can utilize to sell cyber security all through higher training institutions an analytical way.

Keywords -- *Cyber protection, Education, E-learning, Security, Viruses*

I. INTRODUCTION

We live these days in light of the massive unfold of the digital statistics revolution, which has made the arena a higher area and facilitated the approach of verbal exchange to the some distance cease, with its many structures, programs, and technology. Ransomware, fraud, identity robbery, and the higher education area are not a ways from these risks, it has been discovered as very excessive in the listing of objectives of cybersecurity assaults as maximum research have shown that various academic establishments are uncovered to 30% of denial-of-service assaults and ransomware assaults that negatively have an effect on the reputation of those establishments and the workflow in them. therefore, this look at examines the way to shield assets, college students, instructors, and renovation at the integrity of records in higher education institutions because of its terrific importance and the supply of strategies, standards, advice, and guidance essential to enforce the challenge of protecting these establishments from surrounding and potential dangers.

A. Cyber Security

The protection afforded to an automated information machine which will achieve the relevant targets of

keeping the integrity, availability and confidentiality of data system resources which includes hardware, software, firmware, statistics/facts, and tele- communications, in our lived truth, we find that most academic establishments ignore the significance of cyber security, which casts a poor shadow on the data and the complete academic manner. Under we test the records that are to be had in these establishments:

B. Financial Data

Those establishments accumulate, keep and system a hard and fast of financial statistics that includes bank account statistics for personnel and college students, in addition to the accounting and monetary cycle of internal strategies. This essential data could be misused by third parties or others.

C. Personal Information

This is in the form of college students and personnel are prime targets for identity and records robbery attacks, pass-web site programming attacks, spying attacks, etc.

D. Organization Data

Information of students, faculty, and administrative staff from registration procedures, tuition fees, courses, scientific research, student results, and their quarterly reports may be targets internally or external attack aimed at either modifying or not making it available, and certainly it must be protected because tampering with it jeopardizes the reputation, competitiveness, and fairness of institutions [1].

E. Educational Data

Scientific research and evaluation methods are among the matters and other vital educational activities and tasks for educational institutions and exposing them to exposure exposes these institutions to a number of procedures and possibly penalties [2].

Electronic copy available at: https://ssrn.com/abstract=4469269

II. CYBER SECURITY THREATS

Cyber protection threats are defined as any virtual hobby that would threaten the integrity of content material or endanger get right of entry to to records and the privateness of customers. here's a listing of common threats.

A. Viruses

It's malicious code Programs that secretly attach to a file and execute when that file is opened, once a virus infects a computer, it performs two separate tasks.

B. Malware

It's software program that enters into system without the proprietor's knowledge or consent, malware is any software deliberately designed to reason harm to a pc, server, patron, or pc network, the one objectives of malware is to infect a computer system hide the malware's malicious moves bring benefit from the movements that it performs.

C. Trojans

Those threats additionally goal to create a backdoor for your pc that offers malicious customers get admission to on your gadget, probable permitting personal or private data to be compromised. in contrast to viruses and worms, trojans do not reproduce by means of infecting other files nor do they self-replicate.

D. Spyware

Spyware is any software program that installs itself in your computer and starts off evolved covertly tracking your on line conduct without your understanding or permission. spyware is a kind of malware that secretly gathers information about someone or organization and relays this statistics to different parties.

E. Adware

This danger promises advertising and marketing content, regularly as pop-up home windows which could slow or crash a laptop can monitor or music the consumer's activities.

F. SQL Injection Attack

SQL injection (SQLi) is a cyber attack that injects malicious SQL code into an application, allowing the attacker to view or modify a database.

G. Phishing

Phishing is defined as a fraudulent hobby that is achieved to scouse borrow confidential person data consisting of credit score card numbers, login credentials, and passwords.

It also includes executed via using email or different kinds

of electronic verbal exchange by pretending to be from a dependable enterprise entity.

H. Man in the Middle Attack

This status occurs when the attacker is located among the communication channels and monitoring the contents which are sent or received across the channels; it may interrupt or change the data nature or destinations.

I. Denial of Service (DoS) Attack

A denial-of-provider (DoS) attack is a form of cyber attack wherein a malicious actor ambitions to render a pc or different tool unavailable to its meant customers by way of interrupting the device's regular functioning. DoS attacks normally feature by means of overwhelming or flooding a targeted gadget with requests till normal traffic is not able to be processed, resulting in denial-of-provider to addition customers. A DoS assault is characterized with the aid of the use of a single computer to launch the assault.

III. REVIEW OF LITERATURE

Risk management within the scope of assets, threats, vulnerabilities, and events within an organization can be challenging as information assets are continuously created, processed, and stored. Secondly, cyberspace's threat environment is continually changing, where new methods and tools make it is hard to identify, evaluate, and map harmful attacks to an organization [3].

An association between several demographic factors and a student's susceptibility to phishing attack. Lower susceptibility for college affiliation, academic year progression, cyber training, and involvement in cyber clubs or cyber scholarship programs, amount of time spent on the computer, and age demographics. Surprisingly, despite a lower susceptibility for cyber education or IT expertise [4]. User Susceptibility and Behavior indicate a high level of sensitivity to phishing attempts in academia [5].

IV. OBJECTIVES OF THE STUDY

Formerly, many severe scientific portions of research have been carried out concerning the importance of cyber security in the training sector, particularly better training, but just a few of them focused at the guidelines and standards that need to be applied so that those institutions can conquer the hazard of many threats and risks.

Hence, this study specializes in regulations, standards, and measures. And the instructions to be observed within the various establishments of better training. in this take a look at, the dangers and challenges have been mentioned, in addition to the significance of enforcing regulations and requirements to fulfill the escalating cyber security demanding situations in higher education establishments.

Electronic copy available at: https://ssrn.com/abstract=4469269

V. RESEARCH METHODOLOGY

Cyber security demanding situations abound in better training. This explores the cyber security threats that the better education space faces, as well as a number answers which could assist colleges and universities combat destiny attacks. Possibly even greater enormous than ability economic losses, cyber attacks pose a grave risk to a college's reputation and the protection of its college students.

This paper examines the importance of cyber security in the better education area by way of clarifying the numerous risks that can affect the instructional surroundings on this essential zone, which include assaults, viruses, Trojan horses, denial-of- service assaults, and others, observed by using the significance of steering, advice, safety standards and rules which could reduce or prevent dangers. This research additionally sheds mild at the studies carried out in cyber security concerning the education sector and consists of multiple databases considered from last 4 to 5 years as well different online statistical resources.

VI. DISCUSSION

To discuss this study, to talk about this have a look at, and with the affection of the modern-day records, the training quarter has ranked sixth maximum targeted by attacks, because it ranked second for ransomware attacks, and for that reason has been categorized as the least at ease among other sectors, with a charge of extra than 30% of exploitable safety vulnerabilities, affecting about 12% of personnel and college students. most of the attacks that the education zone suffers from are social engineering attacks, which amounted to 41%, and we discover that a percentage of universities agree extra investment should be provided for IT protection to shield the highbrow belongings of critical research.

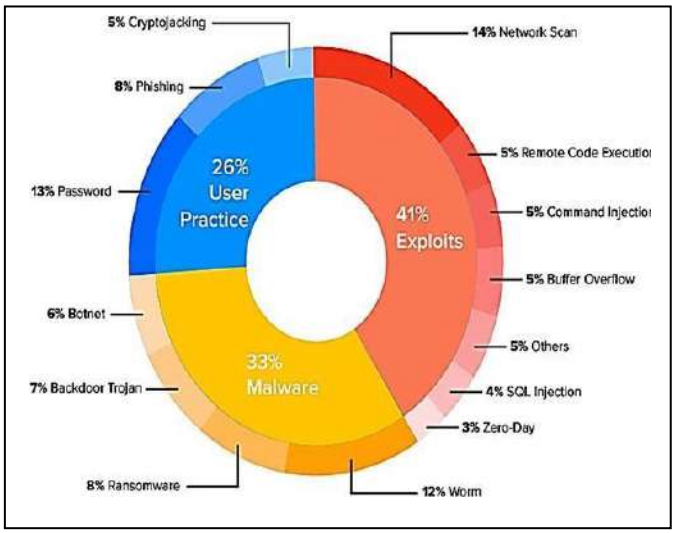

Fig. 1.0 Ratio of Cyber security threats

We also find that 87% of educational institutions have experienced at least one successful attack in the last decade. Including higher education institutions [6], [7].

The cyber security marketplace is expected to grow due to the boom and diversity of assaults and security dangers, which negatively affected information breaches, the unfold of electronic crimes, the entry of so-referred to as virtual terrorism, virtual conflict, and attacks that do not rely on any users or sufferers' action (Zero_Click_Attack) and motive terrific harm. assume increase from $217 billion in 2021 to $345 billion by means of 2026, posting a Compound Annual increase rate (CAGR) of 9.7% from 2021 to 2026 [7].

The training quarter accounted for thirteen% of all facts security breaches during the previous couple of years, sixty percent of data breaches are caused by vulnerabilities that might had been avoided if a safety update or patch were deployed. for this reason the subsequent graphs show the importance and impact of cyber security at the education zone and cowl the maximum vital threats and demanding situations. This observe indicates that 40% of assaults inside the better training zone are due to social engineering assaults, 30% are because of failure to cope with fishing assault problems, and 17% of education establishments pay ransom to restore their information [8].

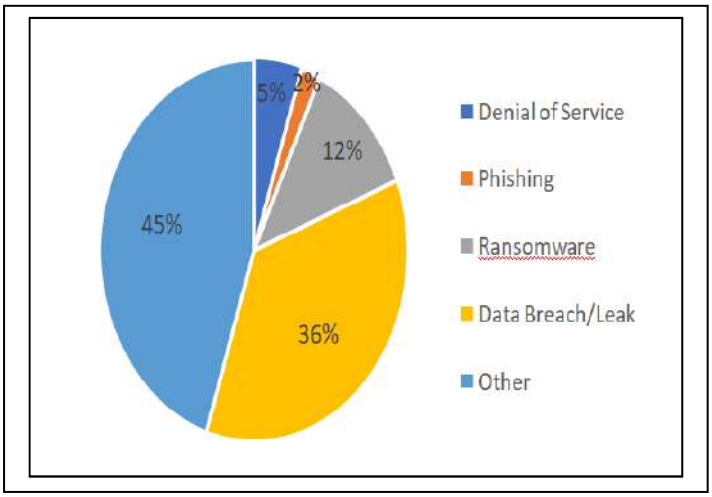

Fig. 2.0 Cyber-attacks in the education sector

Better education had the highest charge of ransomware assaults among all industries surveyed in a 2016 report published by BitSight (a cyber risk control agency), and the second maximum rate in BitSight's 2017 file. as a result, universities are working around the clock to shore up their defenses against those steep potential losses.

Electronic copy available at: https://ssrn.com/abstract=4469269

As Kim Milford, executive director of the research and training Networking data Sharing and analysis center at Indiana university said in a 2016 piece written with the aid of the center for digital education, universities are actually "locked into an pricey arms race" as they discover new approaches of each combating cutting - edge attacks and seeking to stay one-step in advance of attacks yet to come. No matter whether or not cyber attacks are a success, Milford says, they represent a high-priced and ever-gift difficulty that universities are compelled to cope with.

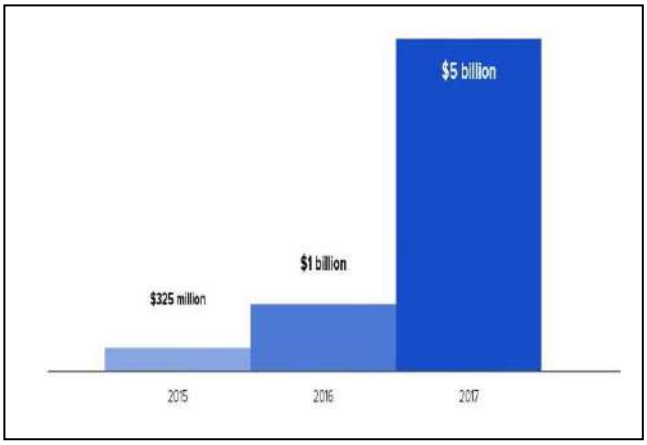

Fig. 3.0 Annual Global Ransomware costs

But the risks posed by cyber attacks extend beyond financial losses for the world of higher ed. Indeed, colleges and universities house a huge volume of sensitive data, from student social security numbers to valuable intellectual property that, if stolen or compromised, could cause significant damage far beyond the walls of the academy. Perhaps even more significant than the aforementioned potential financial losses, cyber attacks pose a grave threat to a university's reputation and the safety of its students. Due to the fact colleges and universities have been so early in adopting virtual equipment and interfaces (and because of economic and different realistic concerns), many establishments of better studying still rely on legacy systems which are especially vulnerable to attacks.

Even though not an problem particular to better education, the dearth in cyber security skills represents a significant impediment that faculties and universities should overcome to address the troubles stated above. A current take a look at conducted via consulting firm Frost & Sullivan initiatives that there could be 1.eight million unfilled cyber security jobs by 2020, and that this skills shortage exists on a global scale, with nearly 70 percentage of professionals globally saying there are too few cyber security workers on staff. With call for for cyber security expertise some distance outpacing supply, corporations frequently pay pinnacle greenback for cyber security understanding.

Phishing attacks are characterized by using emails or web pages that are designed to fool users into entering touchy data, such as passwords or credit score card facts. Generally, the phisher sends an e mail message to a massive group of people whose addresses he has captured from address books and websites across the internet. The message, normally nicely-crafted and reputable-looking, may also claim to be from a economic institution, a service issuer, or another business enterprise acknowledged via the recipient…regularly, the recipient is requested to provide the statistics via clicking a website link inside the electronic mail. However at the same time as the link to the internet site may additionally look legitimate, the link that is displayed isn't always the real web page you go to while you click on on it.

30 percent of users within the education industry have fallen for phishing scams posing as company communications, double the fee of the general population, in the ultimate 12 months.

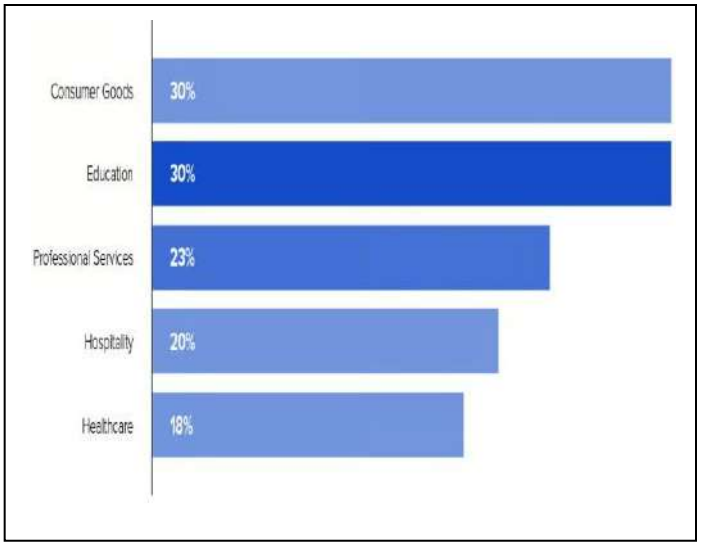

Fig. 4.0 Corporate Phishing Click Rate

Phishing attacks can have a wide variety of ultimate goals, from stealing user facts to putting in ransomware on a sufferer's computer and extracting financial charge. whilst those attacks may additionally seem obvious and clean to avoid, research have shown that a big majority of corporations were victims of phishing scams. The training industry has verified particularly prone, as Wombat protection – a software program business enterprise dedicated to assisting companies to combat phishing attacks – located in a 2017 report that 30 percentage of users within the education enterprise have clicked on phishing scams posing as corporate communications, double the price of the overall populace, in the closing 12 months.

Expertise vulnerabilities, how not unusual cyber attacks paintings, and the way to save you such attacks is essential to creating a greater at ease – and financially solid – future for better education. yet cyber threats are continuously evolving, and there is no assure that the threats faced nowadays (and the strategies for mitigating them) will resemble those going forward.

Electronic copy available at: https://ssrn.com/abstract=4469269

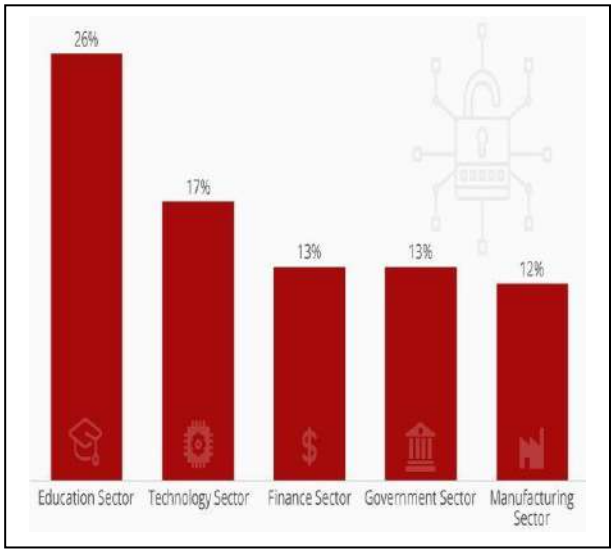

Fig. 5.0 Education Sector suffering from Cyber Attacks

Fig. 5.0 shows the struggling of the academic region's greatest percentage of cyber assaults the various other sectors and that gives the departments of information generation and cyber protection the duty to plot and adopting solid cyber security rules to comfortable the networks and systems [9], [10].

VII. RECOMMENDATIONS

Academic institutions must take appropriate precautions for students' security despite limited resources. Some effective measures are:

1. Implement solid cyber security coverage, to prevent all of the training region surroundings.
2. Putting in the threats preventers' equipment and devices inclusive of firewalls, IDS, NIDS AND IPS so as to triumph over and mitigate the threat.
3. Adopt sturdy access rules to save you unauthorized get admission to the network and restrict the usage of private computers via personnel, students and college to complete paintings obligations.
4. Non-stop attention of the dangers of safety threats by using undertaking workshops and courses for associates.
5. Training IT body of workers to recognize the nature of assaults, dangers, and how they occur, with an emphasis on a way to take advantage of vulnerabilities, preventive measures, and paintings protocols. Pick out the maximum precious IT property and relaxed them by way of the usage of a sturdy safety answer.

VIII. RESULT AND CONCLUSION

The significance of cyber protection within the higher training sector thinking about all the development that witnessing in light of the increasing assaults and risks makes it essential to follow all measures and equipment important to slash these threats in order now not to have an effect on the education surroundings and weaken its outputs. For vital tips and instructions for protection, with a focal point on analyzing risks and ways to protect them and learning a group of proceeding research in cyber security. But, plenty of these companies are open to online attacks and academic establishments should observe security rules a good way to shield their treasured belongings. Additionally, this paper tested the various risks and a way to deal positively with them.

Academic establishments are very crucial and essential, and consequently they should be protected from attacks and dangers to make sure their continuity to carry out their exceptional roles. This look at proved that instructional institutions are still exposed to many safety risks and attacks targeting records and information dumping, competitiveness and intellectual assets problems, and concentrated on students. Security guidelines can reduce most of these dangers and increase the productivity of college students, college, and administrative group of workers. The educational quarter itself can make a contribution to putting off cyber-attacks by means of adopting, sponsoring, and setting up relevant disciplines, and spreading the life-style of precautions, danger bargain, and attention. Maximum of the threats may be triumph over with a few measures, awareness, and correct and cheaper.

This study proved that educational institutions are still exposed to many security risks and attacks targeting data and information dumping, competitiveness and intellectual property issues, and targeting students. The education sector itself can contribute to eliminating cyber-attacks by adopting, sponsoring, and establishing relevant disciplines, and spreading the culture of precautions, risk reduction, and awareness.

AUTHOR’S PROFILE

Prof. Dr. Amol B. Kasture received his M.C.A from University of Pune, India in 2008. He is having 13 years of experience in Industry & academic sector. He has completed his Ph.D in Computer Management under the domain Software Engineering. Presently he is working as Associate Professor in Ajeenkya DY Patil University – School of Engineering (SOE-ADYPU), Pune, Maharashtra, India.

He is member of various International Associations like AIRCC, IACSIT, UACEE, SEEK, SSRN, IAENG, SDIWC, INAAR.

He has presented and published research paper in various State, National, International conferences and Journals. His research interests are Software Engineering, SDLC methodologies in SDLC, Wi-Fi Communication, and Data mining. He has published books on “Expert in VB 6.0” ,“Training Guide of UML”, “Web Technology With HTML 5.0” , “Object Oriented Analysis & Design”, “System analysis and Design” and “Software Engineering; A case study Approach”. He is Research guide for the Computer Science stream.

He has worked in industries like TGS pvt. Ltd, Infosys, Edutech companies. He has worked on different domain like Cloud Technology, Salesforce, Web development, Data Center, MIS etc. He is certified with Microsoft AZURE Administrator, Six Sigma White & Yellow belt in IT etc.

EMERGING TRENDS IN INFORMATION TECHNOLOGY INFLUENCING EDUCATION SYSTEM IN INDIA

DR. AMOL B. KASTURE

Associate Professor

School of Engineering

Ajeenkya D Y Patil University, Pune (Maharashtra), India

❖ ABSTRACT:

The Indian education area has been adopting new inclinations in information era in some of procedures. Through those rapid-growing education developments our schooling technological panorama has made big headway with new models like online faculties and hybrid reading models. Apart from those well-known progressive solutions or options, era has moreover stimulated our training region in lots of greater strategies. This have an impact on may be absolutely visible at some stage in the whole education sector. Besides, the increase of the EdTech organization moreover proves this affect in the course of our education system. The growing tendencies of statistics era have simply created a extremely good impact at the education and getting to know strategies in India. Facts generation has not clearly made training extra appealing and to be had. It has moreover improved possibilities for developing intercultural knowledge in Indian college, university students thru collaborative getting to know and peer tutoring. Within the United States like India wherein in the scholar-teacher ratio is going as immoderate, statistics generation has promised several solutions. All we want is the top of the road use of resources and a zeal to carry the trade we choice!

The last few years have witnessed a dramatic trade within the studying model. The way college students are being taught today can be very exclusive from the education techniques that have been located a few a few years again. Generation has added about numerous modifications inside

ISBN: 978-81-19070-69-5

the way education is brought and acquired. From self-learning to flipped examine room approach, we've visible era make a big effect at the learning and education methodologies.

Keywords: *Education system, Edtech Influence, Emerging trend, Indian Education, Information Technology*

❖ INTRODUCTION:

In spite of being a three hundred and sixty five days of worldwide upheaval, the new year has brought about some of vital developments in virtual answers in education, inclusive of the upward thrust inside the use of apps and hybrid studying and good sized switch to online education, it is nearly specific that teaching will hold to utilize virtual technology for the foreseeable future. With this comes new challenges and tendencies, from lecture room coaching to on-line checks to destiny examine dreams; from continuing to upskill workforce to an updated teaching environment. The Indian education system is in a kingdom of flux. Now not are there "Gurukuls" and an insistence on rote gaining knowledge of, and an strive is made through institutions to awareness on the all-round improvement of the scholars. This shift came about grade by grade while well-known cinema and mass media commenced out to position stress on cognitive improvement over memorizing.

These days the educational scene in India is booming as universities are supplying various courses with respect different sectors like Medical, Finance, Food technology etc and India's pinnacle enterprise colleges hold to attract the company. This is not all. Example: College university students now have the threat to pursue an M.Sc. in big facts analytics in India, PGDM in banking and economic services, and advertising manipulate. Globally, lots of numerous Indian-starting region scientists is a testimony to the reality that proficient people from India can benefit incredible heights. So, wherein lies the problem? A grievance that is leveled at the Indian training tool is that it teaches no longer "what" to think however specializes in "how" to assume in a given state of affairs. Furthermore, education in india is all approximately making organized college students to pass tests. Indian college students are usually readying themselves for warfare.

❖ TOP TRENDS IN THE EDUCATION TECHNOLOGY IN INDIA :

1) Collaborative Learning

The revolutionary traits in instructional generation have made it feasible for anybody to stay associated. The effect of the cutting-edge traits of ICT within the subject of education has paved a couple of options. We be part of, discuss

and enact upon conditions collaboratively. This collaborative method has obtained importance in the getting to know way as well. In a classroom studying version, teachers inspire collaboration by means of assigning institution sports and responsibilities. While university students crew up collectively to paintings on a assignment or remedy a problem, it builds their collaborative competencies. Operating together improves their expertise and will increase engagement. Regardless of the reality that eLearning is pretty famous, it includes collaboration with capabilities to proportion and communicate. In a conventional teaching model, a trainer enters a observe room, speaks for approximately half-hour, and leaves while the bell earrings.

But nowadays, technology has bridged the gap amongst instructors and college students. You will find teachers and university college students interacting with every specific more regularly. Instructors are a ways extra on hand now and act as mentors to assist college students in their usual improvement. This collaborative learning method helps college students to have interaction with their friends and construct their interpersonal skills.

2) Learning Outside the Classroom Environment

Numerous technology developments in training keep converting the virtual global. Cell-based totally devices have taken learning out of doors of the study room. With mLearning and eLearning growing in popularity, college students can analyze at their very personal pace and time. This fashion is anticipated to maintain up as it is a handy technique of delivering as well as receiving the education. Designing mobile-first responsive content fabric lets in university and college students to go through their publications every time and everywhere. Internet connection is now not an hassle with offline analyzing abilities. Ebooks can be embedded with many capabilities to decorate the gaining knowledge of revel in. Whole with annotation equipment, e-bookmarks, hyperlinks, dictionary, are seeking for feature, an ebooks makes reading more flexible. Maximum of the educational institutes in recent times have observed cell gaining knowledge of into their getting to know ecosystems, benefiting university students and instructors alike.

3) Social Media in Learning

Who would have ever notion that social media would in the future be familiar as a part of the studying manner? The technological tendencies in teaching and getting to know are rapidly changing every day. With youngsters as younger as 11 year having social media profiles on diverse systems, you could’t honestly assume to keep them far from social media for too lengthy. So, teachers located a manner to utilize this trend and turn it right into a

effective device for boosting the mastering process. Instructional institutes have started the usage of social media as a conversation device, in which students can have interaction with their peers and school individuals. Usually, college student's percentage films and pictures with their buddies and fans. But with social functions embedded in their eBooks, they can percentage have a look at substances, critiques, initiatives and many others.

They could touch upon a person else's post or proportion links to other web sites, all of the while constructing peer networks and enhancing the online getting to know experience. Instructors allow using social media as part of the gaining knowledge of version as it allows college students to stay interested in their course and increases engagement. Social media is right here to live and incorporating it into mastering modules will build a subculture of collaboration and sharing, main to an improved studying experience.

4) Interactive Classroom

Bringing generation into the classroom has made school rooms lively and interactive. With eBooks, the direction content material can be embedded with motion pictures, augmented fact, audio files and so on. Not like a published e book, ebook permits for more interaction to take region in the classroom. The flipped study room model has allowed college students to do all the learning at domestic and all the practical paintings at faculty. A majority of these new technologies have delivered about a change in the manner that classes used to function historically. Instructors can now assist and manual college students with their homework in class. They could have discussions and activities in classrooms, growing an interactive environment where students are completely concerned in the mastering procedure. Developing interaction and engagement has grow to be a priority for lots faculties and universities. This style of learning has seen a increase in latest years for its capability to hold college students engaged in the classrooms.

5) Data Management & Analytics

Dealing with records has end up ever so convenient and essential with the advent of generation in the education system. Teachers can now have complete analytics of a pupil's performance, including the range of assessments attempted, chapters finished and so on. Homework and assignments may be assigned to the whole class without delay and instructors can compare the results on line. This kind of automation in classroom sports has enabled teachers to recognition more on their route modules and provides in-depth guidance. Analytics has come to be an important part of any on-line studying model as it allows the dimension of an infant's engagement and

academic overall performance. In line with the records to be had, instructors can increase action plans to improve students overall performance. In case the information well-known shows a collective trouble or a troubling pattern with a character pupil's performance, it can be highlighted, and suitable measures can be taken. The remote monitoring of pupil sports enables teachers to offer personalized schooling if required. A majority of these elements have contributed to creating statistics management and information analytics a vital a part of educational training.

6) Personalized Learning

Custom designed getting to know is a method to schooling that tailors teaching and studying to person university college students' desires and alternatives. In 2023, personalized learning should emerge as even more everyday thanks to advances in synthetic intelligence and statistics analytics. Instructors and academic era structures may additionally use AI algorithms to research scholar facts and provide customized recommendations on content material, pacing, and mastering strategies. It turned into best depend of time in advance than the schooling region became taken over through generation. Although the recognition rate became low in the beginning, it grade by grade gained momentum.

Coaching and mastering techniques have long past through a huge change due to all the trends in education generation. Each year, new trends emerge to provide something new to the learners. They are saying change is regular; similarly, enhancements within the subject of generation are also constant. And certain improvements may be applied in the training gadget for enhancing their gaining knowledge of and development device. The end result of those improvements come to be a style which then leads to better teaching and gaining knowledge of strategies.

❖ ADOPTION OF INFORMATION TECHNOLOGY IN EDUCATION SYSTEM:

Information technology usually refers back to the diverse set of technological tools and resources used to communicate and to create disseminate shop and control records. One despite the fact that the additives of it alternate and evolve hastily information and communication exchange technology of some type are part of everyday lifestyles for lots people global inside the business social and education sectors.

The studying way is continuously improving and the usage of increasingly current technology. It makes it simpler for instructors to provide an

explanation for the concern and students find out it higher to acquire facts right. Here are a few techniques generation is being used in education:

1) Neural Education

Neuroscience is the scientific examine of the frightened device together with neuroanatomy, neurobiology, neurochemistry, neurophysiology and neuropharmacology. And its applications in psychology, psychiatry and neurology neural education offers deeper information of the minds excellent capability. It is a gaining knowledge of approach that is aligned with how the brain tactics facts it optimizes the gaining knowledge of experience by way of creating a high-quality temper through self-directed studying allows the mind to embed new mastering in existing knowledge and enhances facts recall speed for long term potentiation.

2) AR & VR Technology

Virtual reality and augmented reality are new technological improvements that convey a selected hassle to the look at room. The usage of VR system, university college by college students can visit an extended manner flung areas and come upon historical civilizations. That could be a charming addition to the reading way, wherein you'll gain near to research that isn't viable in fact. Augmented reality customers get to enjoy entire actual-worldwide surroundings blended with virtual factors. Those eras had been established to definitely have an impact on pupil engagement. With the advent of augmented reality and virtual reality into the schooling machine, the classroom analyzing experience has passed via a first-rate trade. Gaining knowledge of has come to be plenty greater immersive than traditional strategies.

In assessment to simple photos and hands-on experiments within the lab, university students can now view improved variations of the picture and devices on their cellular gadgets. The augmented and virtual reality developments in schooling generation are making gaining knowledge of a compelling revel in.

3) Robotics

Generation enables college students get relaxed with the modern-day global via trouble-fixing further to permits getting to know. Robotics introduces university and college students to all branches of the STEM device (Science, Technology, Engineering, and Mathematics). STEM learning wishes critical wondering and hassle fixing and through robotics in college and university. Students can learn how to technique the statistics they benefit with a solution-

orientated approach. Era in education can help students in lots of approaches. Folks that face challenges in analyzing can use Edtech and can overcome some of the troubles they face, college students who dislike topics like math can boom an interest in the difficulty and may decorate the overall general performance of the classroom.

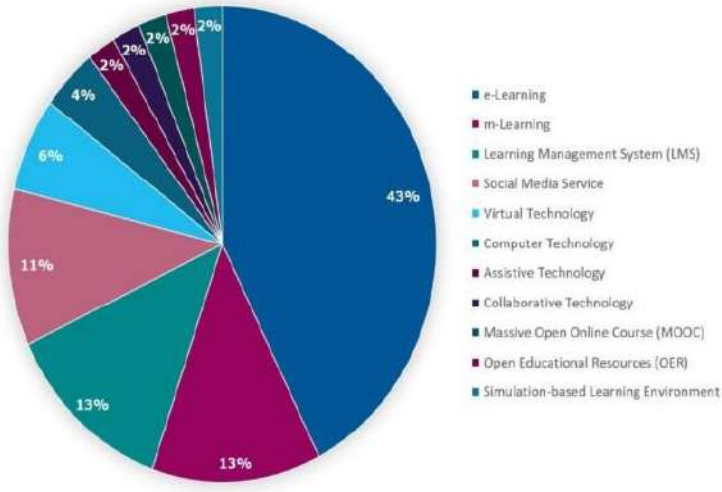

Fig 1.0 Educational Technology Adoption: Type of Technologies and Modes of Delivery

❖ IMPACT OF INFORMATION TECHNOLOGY TREND'S ON INDIAN EDUCATION SYSTEM:

From self-studying to flipped study room method, we've visible era make a extensive impact on the mastering and teaching methodologies. With several advantages to offer, digital mastering has become an crucial part of the education system. Information and communication technology (ICT) brings in more than one benefit for digital mastering and pupil-centric engagement. The ICT developments in education formed the faculties and universities to implement the todays in education technology so one can enhance the coaching and getting to know method.

Facts generation has sincerely revolutionized the conventional academic structures into training, distance mastering, flexible gaining knowledge of, e-studying, collaborative studying, on every occasion, anywhere analyzing, virtual reading, and multimedia method to gaining knowledge of and so on.

ISBN: 978-81-19070-69-5

Programs of statistics era are considerably applied in Indian schools, education and specific instructional institutions which simplified the technique of teaching and analyzing. It helps in growing listening, speakme, analyzing and writing skills of the human beings. PC Assisted Language analyzing software program software, can educate the languages with none help of a instructor.

Technological breakthroughs have made sharing at the net an on hand and alternative. The e-analyzing is the cutting-edge idea, generated through statistics era which results in convenient learning, minimizing the instructional cost of journeying to specific factors for Indian education system.

- The e-learning is the handy approach of reading anywhere at any time.
- E-gaining knowledge of guarantees that users have get entry to standardized content material, as and after they want it.
- In a study room, it could be hard for an trainer to devote equal attention to all of the college students. However e-getting to know allows the students to have a look at a tempo this is relaxed, focuses on difficulties and take a destroy while it suits.

Presently, academic technologies (Edtech) are redefining the educational space. As in line with media reports, edech players entered the market round 2012 and the length between 2012 and 2019 got here to be called the generation of edtech revolution. A 2021 record by using the consulting firm, PriceWaterCoopers, at the side of the Confederation of Indian enterprise notes.

Many instructional institutions internationally are shifting to cloud-based totally infrastructure, especially after the advent of put up-pandemic, online coaching. This infrastructure enables teachers to train from anywhere and the scholar can access the class truly. In India, wherein the absence of good enough infrastructure in rural regions regularly inhibits girls from enrolling into faculties, virtual fairness and cloud-based infrastructure can fill a big hole. Cloud-based totally projects that perform in a digital mode reduce the infrastructural cost of lecture rooms and also help students to get right of entry to studying substances easily.

❖ CONCLUSION:

The need of the hour is to adapt to the evolving technological marvels due to the fact educational era won't be a bombilation (buzz) but as a substitute a

truth for the imminent future of education. While embracing technology as our critical component, one should now not end up a slave of it.

Every infant has exclusive gaining knowledge of desires and customized or personalized coaching is a non-linear scholar-centric educational method this is administered as per each student's skills. With the aid of technology inclusive of artificial intelligence (AI), machine learning (ML), huge statistics and augmented learning (AL), educator can provide customized teaching material to students. These technologies beautify the pupil's creativity, offer an immersive revel in, and sell essential wondering. Those techniques bridge gaps within the academic machine and allow college students to study at their very own pace in Indian education system.

The Indian education system has advanced considerably through the years. However, the system need to hold to conform with technological improvements and the changing dreams of college, university, college students and employers. One of the techniques the education location is growing is through the use of Ed-Tech, a technology specifically designed to manual and beautify the analyzing manner.
Education generation has the capability to convert the Indian education technology through supplying personalized reading evaluations, online and blended getting to know opportunities, gamification, AI and device studying, and virtual reality. To truly realize the capacity of schooling technology, there can be a want to invest in instructor training and digital literacy, collaborate to provide cheaper get admission to schooling generation systems, and constantly innovate and enhance. Through doing so, India can prepare its students for the destiny and create a greater equitable and inclusive education system.

SOFTWARE ENGINEERING

A Case Study Approach

By Dr.Amol B. Kasture

MESSAGE FROM THE DESK OF DEAN,

SOE – ADYPU, PUNE

Dear Readers,

It has been my pleasure to know Dr. Amol B Kasture as a passionate researcher and a profound academician in the field of Computer Sciences specialized in Software Engineering. He has been touching the lives of the students with his unique approach of involving students into research and experiential learning. Dr. Kasture is pretty focused towards his goal of making the fundamentals of students strong and this book is his exceptional creation in this regard.

I have watched him going through vicissitudes of fortune in bringing this book into reality. I am always an admirer of his passion for teaching and wish him the best for this book.

Dr. Biswajeet Champaty
Dean -School of Engineering
Ajeenkya DY Patil University

Pune - 412 105
Maharashtra , India

Copyrighted Material

Dear Readers,

It gives me immense pleasure to write comments on the book entitled SOFTWARE ENGINEERING: A Case Study Approach written for Information Technology, Computer Engineering, Computer Application & Computer Science Students. This book contains total of 14 chapters on Software Engineering including solved case studies. In this book language used is simple, and lucid and covers the concept with examples. The topics within the chapters have been arranged in a proper sequence to ensure the smooth flow of the subject.

This book will be useful to the students to learn the concept and hands-on Software Engineering. It will be also useful to develop applications or systems as well as prepare project documentation. Examples will be helpful for self-learning without taking expert guidance. The Solved case studies are very helpful to understand the concept of analysis and design in depth.

So best of wishes to all readers referring to this book.

"Build the software of your thoughts & starts the system development"

Metadata

Abstract:
In this paper, we are introducing an innovative, efficient, and real-time handwritten text-to-speech conversion technique for the Devanagari script. It combines the concept of Optical Character Recognition (OCR) and Text to Speech Synthesizer (TTS). This type of system can be helpful for visually impaired persons, for reading the number plates of a vehicle, and for medical applications. Text extraction from colored images is a challenging task in computer vision, for that, we have trained our model using Convolution Neural Network (CNN) with 1000s of different handwriting styles written by different people and of different age groups for each character. A trained model has been used for the recognition of input characters which was taken from the gesture movement of a fingertip with blue ink. The system is developed in Python 3.6.0.

Contents

I. Introduction

Devanagari is a compound of 'Deva' and 'Nagari', which means abode of divinity [1]. It was developed in ancient India around 1st century and was in regular use by 7th century. This script is originated by Brahmi script used to write over 120 languages such as Hindi, Sanskrit, Marathi, Nepali and many more. This script composed of 47 primary character including 14 vowels (Swar) and 33 consonants (Vayanjans) [1]. It is 4th most widely adopted writing system. This is not a case sensitive unlike other scripts.

Limiting periodic orbits in the neighborhood of the triangular equilibrium points when the more massive primary is an oblate spheroid

Prashant Kumar ; Ram Krishnan Sharma; Piyush Gaur

Check for updates

+ Author & Article Information

AIP Conf. Proc. 2797, 090001 (2023)

https://doi.org/10.1063/5.0149703

In the restricted three–body problem, we explore the motion of the infinitesimal mass in the vicinity of the liberation point L_4 taking into account the oblateness of the more massive primary. When higher order terms are retained in the analysis, the period of the orbit is found to be a function of the two finite masses and the size of the orbit. Furthermore, it is proved that the critical mass value decreases with oblateness. Finally, limiting periodic orbits are generated for values of the mass ratios 0.038097 and 0.038541. Both type of periodic orbits shift towards the smaller primary with oblateness. The effect is found to be more near the extreme of the major axes of the near-elliptical orbits with oblateness. Natural objects are frequently discovered circling near the Lagrange points of planetary systems due to the natural stability of L_4 and L_5. 'Trojans' or 'Trojan asteroids' are the generic names for the objects that inhabit those sites. As the Sun and Jupiter are the two most massive objects in the Solar System, there are more Sun–Jupiter Trojans than for any other pair of bodies. A space station could be placed in L_4 or L_5 of the Earth-Moon system in the future.

Topics

Space station, Planetary systems, Astrodynamics, Asteroids, N-body problem, Solar system, The Moon

Intelligent and Conventional Methods for SoC and SoH Estimation

Ravi Gandhi, Ashutosh Jha & Kinal Bhavsar

Conference paper | First Online: 31 August 2023

108 Accesses

Part of the Lecture Notes in Networks and Systems book series (LNNS,volume 720)

Abstract

Owing to the benefits of a longer life, lithium-ion power batteries with high specific power and energy have been widely used in the transportation sector. However, the safety issues brought about by the incorrect calculation and forecasts of battery health have drawn a lot of interest from academics. The fundamental explanations of the “State of Health” (SoH) and the process by which they degrade were

summarized from both local and foreign literature in this research. Three perspectives were taken into consideration when discussing the estimation and prediction approaches for lithium-ion power batteries: model based approaches using fusion technology, and data-driven methodologies. The benefits and drawbacks of the standard estimation of SoH and prediction methods used today are outlined in this paper. It is vitally necessary to develop an efficient management of energy storage system that can assess the lithium-ion battery's overall health and charging condition. Lithium-ion batteries' state of charge (SoC), which defines how much charge is still in them, is a crucial EV metric. Additionally, SoC offers details regarding the charging/discharging procedure, preventing either an overcharge or an over-discharge of the battery. The different SoC estimate approaches are in-depth examined in this research. SoC estimate methods are thoroughly explored, along with their methodology, mathematical model, advantages, disadvantages, and error rate. The research closes by making several significant recommendations for the improvement of SoC estimates in electric vehicles and applications.

Generic Classification and Automatic Extraction of Mechanical Interlocking Features from CAD Model

Shantanu Kumar Das

Conference paper | First Online: 06 October 2022

318 Accesses

Part of the Lecture Notes in Mechanical Engineering book series (LNME)

Abstract

This paper presents the classification, representation and extraction of mechanical interlocking features (MIFs) from the CAD model. Mechanical interlocking features (MIFs) are geometric features of two or more parts that when caused to come into contact and fully engage, prevent relative motion in certain directions of translation and/or rotation, including, when features physically interlock, unwanted separation in any or certain directions. The MIFs are represented as a set of faces with a characteristic arrangement among the faces among parts in proximity.

This characteristic arrangement of contact faces and their topological relationships help in classification of MIFs. The MIFs are classified into elementary and compound types based on the number of assembly features available at the joint location. Even though CAD assembly models are available to users, it is rather difficult for the user to manually extract the assembly feature information from CAD models. It is therefore a set of algorithms are developed to extract the attributes of MIFs and identify MIFs from CAD model. CAD assembly models from aerospace domain have been used in order to illustrate and validate the proposed approach.

Mission

Growing awareness and an increased focus on environmental issues such as climate change, energy use, and loss of non-renewable resources have brought about a greater need for research that provides potential solutions to these problems. Research in environmental science and engineering continues to play a vital role in uncovering new opportunities for a "green" future.

The **Advances in Environmental Engineering and Green Technologies (AEEGT)** book series is a mouthpiece for research in all aspects of environmental science, earth science, and green initiatives. This series supports the ongoing research in this field through publishing books that discuss topics within environmental engineering or that deal with the interdisciplinary field of green technologies.

Coverage

- Industrial Waste Management and Minimization
- Radioactive Waste Treatment
- Contaminated Site Remediation
- Biofilters and Biofiltration
- Air Quality
- Electric Vehicles
- Cleantech
- Pollution Management
- Sustainable Communities
- Green Technology

IGI Global is currently accepting manuscripts for publication within this series. To submit a proposal for a volume in this series, please contact our Acquisition Editors at Acquisitions@igi-global.com or visit: http://www.igi-global.com/publish/.

The Advances in Environmental Engineering and Green Technologies (AEEGT) Book Series (ISSN 2326-9162) is published by IGI Global, 701 E. Detailed Table of Contents

Preface xvi

Acknowledgment xxiii

Chapter 1
Bioenergy: Social, Economic, and Environmental Impacts 1
Shweta Arun Avhad, Savitribai Phule Pune University, India

As we know that escalating population demand and technological advancement lead us towards a new world dominion power, but with that, there is huge pressure on resources due to an increase in consumption at all levels globally. This leads to revamping environmental motifs all over the world and non-renewable sources are estimated to be not rehabilitating soon. In this case, bio-energy is energy presented as a major opportunity to address the issues of climate change by reducing carbon emissions. This chapter explore bioenergy.

Chapter 2
Life Cycle Assessment of Biofuels: Challenges and Opportunities 22
Majorie Moraa Nyasani, Machakos University, Kenya
Victor Odhiambo Shikuku, Kaimosi Friends University, Kenya

To address energy security and climate-change concerns, substitutes are needed for petroleum-based transportation fuels. In addition to electricity and natural gas, biofuels are emerging as an important class of substitutes. The promotion of biofuels as energy is mainly driven by the perspective of oil depletion, concerns about energy security, and global warming. However, results published in the past few decades present conflicting pictures regarding the energy efficiency and sustainability of biofuels. To adequately address these real or apparent contradictions, a life cycle assessment (LCA) of biofuels is indispensable. “Life cycle” refers to all stages of a process: from the cradle, that is, raw material extraction through manufacturing, distribution, and use to ultimate disposal. This chapter discusses the benefits and limitations of biofuels from an LCA standpoint. The discrepancies and strengths in LCA of biofuels are critically analyzed and opportunities are highlighted. LCA of biofuels is shown to be critical to informing policy and for practical application.

Chapter 3
Entrepreneurial Opportunities In Bioenergy 32
Prashant Kumar, Department of Bioinformatics, Kalinga University, Raipur, India
Sunil Kumar Verma, B.N. College of Engineering and Technology, Lucknow, India

Entrepreneurism is vital as entrepreneurs push technological change and innovation, consequently generating economic growth. Bio-energy entrepreneurism is the focal point of this chapter, along with entrepreneurial motivations, opportunities, and market drivers. Market drivers include government policies, trends in energy use, and progression of the energy sector into more renewables. Several factors influence entrepreneurs, which involves several factors ranging from the environment to economics, pioneering spirit, and social factors. With the help of entrepreneurial motivations and market drivers, individuals can easily visualize and plan all the bio-energy sector opportunities. Bio-energy entrepreneurs moderate the market of transformation of biomass to energy. The bio-energy field is filled with stories of failures, successes, and everything in between. There is a marginal difference between a failure story and a success story in the modern bio-energy sector, which narrow down to timing.

Chapter 4
Biofuel Policies in India: An Assessment of Policy Barriers 44
Sunil Kumar Verma, B.N. College of Engineering and Technology, Lucknow, India
Prashant Kumar, Department of Bioinformatics, Kalinga University, Raipur, India

Energy is one of the most precious and demanded commodities among various industries and consumers to sustain the current lifestyle. Energy is a crucial element, which unswervingly influences the country's economic development. Numerous methods are adopted to reduce global warming, embracing clean energy from wind, solar, and biomass sources. This chapter speaks about the current situation of energy demand, the innovations in biofuel sources, and the obstacles regarding the commercialization and production of microalgal biofuel.

Chapter 5
Green House Gases: Challenges, Effect, and Climate Change 65
Kannadhasan S., Study World College of Engineering, India
Nagarajan R., Gnanamani College of Technology, India

Changes in weather patterns over decades or longer periods of time are referred to as climate change. Natural and human forces both contribute to climate change. Since the Industrial Revolution, humans have contributed to climate change through emitting greenhouse gases and aerosols, as well as changing land use, leading global temperatures to rise. More storms, floods, droughts, and rising sea levels may result from increasing global temperatures and the melting of ice sheets, sea ice, and glaciers. The sun's rays supply energy to the whole world. GHGs are required to trap heat and maintain a temperature that permits life to flourish on the planet. The greenhouse effect is a natural and necessary occurrence for life on Earth to survive. If the greenhouse effect did not exist, the world would be around 33°C cooler right now. Humans have contributed to the increase in atmospheric GHGs via rising fossil fuel usage and deforestation in recent decades. Increased GHG emissions have been the primary cause of global warming during the last century.

Chapter 6
Biofuels From Bio-Waste and Biomass 75
Kondapalli Vamsi Krishna, Christ University (Deemed), India
Sompalli Bhavana, Christ University (Deemed), India
Koushik Koujalagi, Christ University (Deemed), India
Alok Malaviya, Christ University (Deemed), India

The planet's limited natural fossil fuel reserves are anticipated to be very soon owing to massive usage. Biofuels would be a critical alternative source that may reduce global warming and CO2 emissions. The food-versus-fuel dilemma is, however, one of the key drawbacks of first-generation biofuels like corn ethanol, sugarcane ethanol, etc. Cellulose and hemicellulose, the primary constituents of lignocellulosic feedstocks, could be reduced to sugars by either thermochemical/biological processes before being fermented to generate biofuels. However, owing to structural heterogeneity, more complicated operational techniques are required before the production technology can be commercialized, and several challenges must be addressed. This chapter provided an assessment of various feedstocks, availability, various processing techniques, obstacles, and current technical developments in the generation of biofuels from biomass.

Chapter 7
Biogas: Renewable Natural Gas 119
Bela Khiratkar, Ajeenkya D.Y. Patil University, India
Shankar Mukundrao Khade, Ajeenkya D.Y. Patil University, India
Abhishek Dutt Tripathi, Banaras Hindu University, India

Biogas is a renewable natural gas used in production of energy which is generated by breakdown of organic matter by anaerobic digestion. It is a composition of methane, carbon dioxide, and some other gases in small quantities. The most common natural resources for production of biogas are aquatic sediments, animal waste, crop residues, wastewater sludge, and many others. Some other sources are landfills, water lagoons, etc., which are a result of human activity. There are several technologies used for biogas production, mainly biodigesters, wastewater treatment plants, and landfill gas recovery systems. Production of biogas is highly dependent on the feedstock availability and the policy support by the government.

Chapter 8
Algae as Superfood 129
Shital Uddhav Giri, Ajeenkya D.Y. Patil University, India
Namdev Gopal Krishna Hadapad, Ajeenkya D.Y. Patil University, India
Aditya Akhade, Ajeenkya D.Y. Patil University, India
Parth Bhilare, Ajeenkya D.Y. Patil University, India

With the increasing population, there are problems like the shrinking of arable land, pollution, and feeding the entire growing population high-quality food and reaching consumer demand, and the list goes on. Novel superfoods are rich in nutrition and produced with the most sustainable methods, including algae, specifically microalgae. Microalgae have been studied for decades. Microalgae are one of the largest and most poorly understood organisms on planet earth, but in recent years, the research has been increased for the search of renewable and sustainable energy sources. Microalgae don't require much land for cultivation and thus do not compete with conventional agricultural land. Microalgae can double their size in 24 hours. CO2, solar rays, inorganic nutrients, and water are the basic requirements for them to

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

grow. There are microalgae and macroalgae (e.g., seaweed) that grow in saline and hypersaline water. This chapter presents the promising potential of algae (microalgae and macroalgae) as a superfood.

Chapter 9
Biofuels From Macroalgae: A Sustainable Alternative to Conventional Energy Resources 148
Debraj Biswal, Government General Degree College at Mangalkote, India
Dipanwita Sarkar (Paria), Chandernagore College, India

The steep rise in human population together with the simultaneous growth of urbanization and industrialization has triggered overuse of fossil fuels in the recent years. However, they are non-renewable and release carbon dioxide causing global warming. In this context, biofuels come as excellent substitutes because they are renewable and eco-friendly. They are obtained from biological products and include biodiesel, biomethane, bioethanol, and biohydrogen. They are classified into first, second, and third generation fuels depending on the biological feedstocks being used. Of these, the third-generation fuels, obtained from marine resources like algae, have attracted special research interests because they do not rival the food crop production or depend on land and freshwater for their cultivation. However, the potentialities of macroalgae as a biofuel resource have not been investigated thoroughly. The chapter tries to outline all the aspects of biofuel production from macroalgae pointing out the scopes for future research.

Chapter 10
A Source of Future Energy: Gas Hydrates 170
Anupama Kumari, Indian Institute of Technology, Roorkee, India
Mukund Madhaw, Independent Researcher, India
C. B. Majumder, Indian Institute of Technology, Roorkee, India

Natural gas hydrate (NGH) has emerged as a future source of energy for the world that can fulfill the future energy demand. The natural gas hydrates hold twice the amount of energy than all available fossil fuels. At present, the energy demand is growing, but these are not available commercially. Various field applications on the dissociation of the natural gas hydrates have been performed till now, and the output of these field applications confirms the possibility of dissociation of the natural gas hydrates. At distinct locations in the world, the huge deposits of hydrates have been identified, but the safe and economic dissociation of gas hydrates is not known yet. Hence, the evolution of new and inexpensive, suitable methods and technologies are required for the dissociation of gas hydrates. In this chapter, the authors reviewed several articles to compare the different dissociation techniques of gas hydrates and their field applications. The advantages and disadvantages of these production methods have also been discussed.

Chapter 11
Recent Advancements in Microalgae-Biofuel Generation Employing Nano-Additives 188
Mahesh Pattabhiramaiah, Bangalore University, India
Shanthala Mallikarjunaiah, Bangalore University, India
Bhargavi Rajarathinam, Centre for Applied Genetics, Department of Zoology, Bangalore University, Bangalore, India

Biofuels have gained significant interest as an alternative fuel in recent years owing to their environmental sustainability, cost-effectiveness, and the ability to blend with traditional fuels like gasoline without requiring engine modifications. The use of microalgae for biofuel production is universally preferred due

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

to its energy efficiency and environmental sustainability; current research is geared towards enhancing the production of microalgae-biofuel from the initial stages to the final product as it is a cost-effective fuel option. The use of different types of nano-additives at different stages of microalgae cultivation and incorporation into biofuel produced noteworthy improvements in the final product. This chapter focuses on the prospective uses of nano-additives in microalgae cultivation, microalgal biomass conversion to biofuels, and biofuel combustion improvement for revolutionary advancements in biofuel technology.

Chapter 12

Macroalgae-Based Bioethanol 206
Sakshi Kolpe, Ajeenkya D.Y. Patil University, India
Shankar Mukundrao Khade, Ajeenkya D.Y. Patil University, India
Shivraj Nile, Zhejiang Chinese Medical University, Hangzhou, China

The chapter discusses the methods effective for the extraction of useful energy from the macroalgae biomass including liquefaction, anaerobic digestion, fermentation to biobutanol, trans-esterification to biodiesel, pyrolysis, direct combustion, fermentation to bioethanol, and gasification. However, if the algae are suited for the production of biodiesel, they can be studied from the content of their triacylglycerols (TAGs). Due to having high fatty acid content, they have a high conversion rate to biodiesel, and the lack of sulphur, phosphorus, and nitrogen also aids in the conversion. This chapter highlights the limitations and suitability of macroalgae for the conversion process in reference to chemical composition, process optimization, and cost effectiveness. It is concluded that bio-oils and bioethanol produced from wet macroalgae are considered over biodiesel production because of high lipid content of microalgae biomass. Moreover, the chapter considers electricity production from the dry mass as it would turn profitable, and this can be achieved from fast-growing macroalgae like "Ulva."

Chapter 13

Microalgae Biofuels: Challenges and Potential 217
Naresh Tanwer, Maharshi Dayanand University, India
Vaishali Arora, Maharshi Dayanad University, India
Priyanka Bumbra, Maharshi Dayanand University, India
Kiran Grewal, Maharshi Dayanand University, India
Jitender Singh Laura, Maharshi Dayanand University, India
Babita Khosla, Maharshi Dayanand University, India

Development of sustainable energy resources is a major concern in front of the scientific community and stakeholders in this field. Invariably, fossil fuels are utilized to meet the major part of energy demand all over the world, but their stocks are limited. Burning of fossil fuels also causes significant environmental pollution that results in drastic climate change. There is an emergent need of an alternative to fulfill the current energy demand in a sustainable way along with sorting out the pollution issues. Microbial biofuels could be the most appropriate choice in this regard because it bears enormous potential that needs to be exploited. But it has some challenging issues to employ it to meet out the current energy demands. This chapter illustrates the microbial biofuels, harvesting techniques, different process, and potential to utilize them as sustainable energy sources along with considerable challenges that need to be addressed

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM

to make it an eco-friendly and economic fuel choice to pave the path of sustainable development.

Chapter 14
Microbial Cellulase in the Production of Second Generation Biofuels: State-of-the-Art and Beyond 233
Jovana Trbojević-Ivić, Innovative Centre, Faculty of Chemistry, Belgrade, Ltd., Serbia

Bioethanol from inedible cellulose-rich biomass is the most promising candidate to replace fast depleting, environmentally polluting fossil fuels. Hydrolysis of cellulose to glucose is the crucial step in its biotransformation to bioethanol. Enzymatic hydrolysis is favored over acid hydrolysis, as enzymes are eco-friendly biocatalysts with high substrate specificity and superior catalytic efficiency in mild reaction conditions. Complete hydrolysis of cellulose is achieved by cellulase. Higher cellulase production yield, stability, and catalytic efficiency are the main attentive points for the successful implementation in industrial production of bioethanol. This chapter will highlight general characteristics of microbial cellulases and their role in the bioconversion of cellulose to biofuels, economic sustainability of cellulose-based biofuels, and the latest innovations in cellulase immobilization as the most comprehensive strategy for improvement of enzyme stability, activity, and reusability for cost-effective large-scale application.

Chapter 15
Comparative Studies on Neem and Jatropha Oil-Derived Biodiesels..... 258
Sunil Kulkarni, Gharda Institute of Technology, Lavel, India
Ajaygiri Goswami, University Institute of Chemical Technology, Jalgaon, India
Ghayas Usmani, University Institute of Chemical Technology, Jalgaon, India

Sustainable development is a key aspect of modern-day development. Reducing fuel cost and emissions is considered as the most important research area in sustainable development. Biodiesel has the potential to reduce the requirement of petroleum diesel if blended in suitable proportion. Various feedstocks are being explored for biodiesel production. Oils derived from neem and jatropha can be utilized for biodiesel production. In the current investigation, optimum parameters for the production, namely catalyst proportion, temperature, and oil-to-alcohol ratio were optimized. Experiments were carried out at different blend proportions to study fuel properties, namely kinematic viscosity, aniline point, diesel index, flash and fire points, specific and API gravity, cetane number, and ASTM distillation characteristics.

Chapter 16
Characterization and Comparison of Various Blends of Honge Oil Methyl Ester (Biodiesel) With Diesel Fuel 274
Sunil Kulkarni, Gharda Institute of Technology, Lavel, India
Ajaygiri K. Goswami, University Institute of Chemical Technology, Jalgaon, India
Ghayas A. Usmani, University Institute of Chemical Technology, North Maharashtra University, Jalgaon, India

The Honge oil, known as pongamia oil, is one of the most widely used lamp oils around the world. It is also used in leather tanning, in soap making, and as a lubricant. The Honge oil methyl ester can be used as an alternative fuel for diesel. The transesterification of methanol and Honge oil in the presence of base catalyst results in Honge oil methyl ester. In the current work, the Honge oil methyl-ester known as biodiesel was produced. It was mixed with petroleum diesel fuel in different proportions. Various physical and petroleum properties were investigated for Honge oil biofuel and also for various diesel and

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

ester mixtures. The optimum parameters were temperature was 65oC, catalyst quantity, 0.4 grams and oil: alcohol ratio, 1:6. The blends of 10%, 20%, and 30% compositions were most suitable as potential alternative fuel. Different proportions of biodiesel ester in diesel fuel have been also compared with petroleum diesel fuel to identify a suitable blend having good engine fuel potential.

Chapter 17
Explicit Conceptual Design Approach to Adapt a Biomass-Fed Anaerobic Digester and Status Indicators in Semi-Arid Areas 291
Yusto Mugisha Yustas, Sokoine University of Agriculture, Tanzania

The mitigation of adverse climate change requires holistic strategies. The strategies include the proper handling of biomass wastes such as cow dung. The handling of the wastes has to be efficient using appropriately designed anaerobic digesters. In addition, the operating status of these digesters has to be monitored for detection of any fault of the digesters. Unfortunately, existing approaches for designing and monitoring the working condition of digesters have limitations. This chapter presents the innovative and explicit conceptual design approach of adapting the biomass-fed anaerobic digester and the digester operating-status-indicators in semi-arid areas. The approach is recommended to the renewable energy system designers. Finally, the appropriate indicators are recommended to be applied by the biogas plant operators or users.

Chapter 18
Pretreatment of Lignocellulosic Biomass and 2G Ethanol 322
Hitesha J. Panchal, Parul University, Vadodara, India
Krishan Kumar, Parul University, Vadodara, India

Rapid depletion of fossil fuel-based energy sources increased the demand for alternate energy sources. Lignocellulosics-based 2G ethanol can be used as an alternative sustainable source that presents in ample amount. Sources of lignocellulose biomass are wood, food-agriculture wastes, and forest residues. Cellulose, hemicellulose, and lignin are the core components of lignocellulosic biomass. Cellulosic and hemicellulosic biomass are enzymatically hydrolyzed to produce the monomer sugar (such as glucose or xylose) which is further converted into ethanol using fermentation process. The presence of lignin provides physical barrier that limit the access of enzymes required for saccharification. Pretreatment helps in removing the lignin from biomass and reducing recalcitrance. Pretreatment can be done by conventional methods, which are chemical, physical, and biological. This study covers the different methods of pretreatment including their disadvantages and benefits along with saccharification and fermentation processes.

Preface

This is the right time to tackle the changing climate by making concrete plans and taking necessary actions to regulate the existing responsible factors for changing the climate. This can be only possible with the renewable source of energies. In addition to increase the level of pollutant gases upon burning in the environment, the near future depletion of existing fuels made the researchers to think on the alternate sources to mitigate the problems associated.

This issue is mainly concerned with this phenomenon and must be regarded as the commencement of a more extensive efforts for understanding public policy-making and public administration in the bioenergy. This era sees the growth of bioenergy, introducing new products, inclinations, procedures, tactics, and theories daily, thereby changing the environmental issues.

Biofuels produced either from living cell biomass or once live biomass can have efficient energy to acts as an alternative to the existing non-renewable fossil fuels. However, in the production of biofuels efforts are being made worldwide to make the fuels cost-effective. In the first generation, biofuels are derived by fermentation from the edible sources such as edible oils, corn, sugar etc. which limit the use of these sources. In the second generation, the biofuels are obtained from the non-edible sources like wheat straw, rice straw, jatropha seeds, sugarcane bagasse etc. The most critical step followed in this generation is to depolymerize and removal of lignin present in the lignocellulosic biomasses, thereby makes the process costly. Most of the challenges are overcome in the third-generation biofuels, where biofuels are derived from the living cellular biomass i. e. algal cells. The ability of certain algal species to accumulate the lipid inside the cells which can be transesterified into biodiesel. The algae can be cultivated in a small area using relatively cheaper nutrients and limited resources which can be used to produce biofuels.

With considering the global climate change, the several countries have initiated the efforts in mitigating the hazardous effects of pollutants by increasing the dependency on bioenergy.

INSIDE THIS BOOK

In this regard, the first chapter is devoted bioenergy-social, economic, and environmental impacts, which can comprehensively constitute the importance of bioenergy to protect the environment. As we know that escalating population demand and technological advancement leads us towards a new world dominion power, but there is huge pressure on resources due to an increasing consumption at all levels globally. This leads to revamping environmental motifs all over the world and non-renewable sources estimated to be not rehabilitating soon. In this case, bioenergy is energy presented as a major opportunity to ad-

Dr. Ashok Rathoure (asokumr@gmail.com)

dress the issues of climate change by reducing carbon emissions. It affects socially by increasing living of standard to creating societal conflict, poverty and transportation cost and job opportunity economically. Environmentally reducing pollution to forest land unavailability concerns. As its major threats of bioenergy have not instigated at greater risk for the world, yet hence it seems to be a good solution for now. The rate of expansion of bioenergy products depends upon a great deal of government policies, straightforward strategy, and foreign investments in developing countries. With taking care of these bioenergy negative aspects also hindered.

The second chapter is based on the challenges and opportunities of biofuels. The results of this study reveal the hurdles that comes in producing the biofuels and replacing the existing fossil fuels. To address energy security and climate-change concerns, substitutes are needed for petroleum-based transportation fuels. In addition to electricity and natural gas, biofuels are emerging as an important class of substitutes. The promotion of biofuels as energy is mainly driven by the perspective of oil depletion, concerns about energy security, and global warming. However, results published in the past few decades present conflicting pictures regarding the energy efficiency and sustainability of biofuels. To adequately address these real or apparent contradictions, a Life cycle assessment (LCA) of biofuels is indispensable. "Life cycle" refers to all stages of a process: from the cradle, that is, raw material extraction through manufacturing, distribution, and use to ultimate disposal. This chapter discusses the benefits and limitations of biofuels from an LCA standpoint. The discrepancies and strengths in LCA of biofuels are critically analyzed and opportunities are highlighted. LCA of biofuels is shown to be critical to informing policy and for practical application.

The third chapter, "Entrepreneurial Opportunities in Bioenergy," claims that the necessity to broaden the scope of bioenergy across the globe. This can be achieved by initiating the new firms to protect the environment from the fossil fuels. One can start the firm in the area of bioenergy for which Government also gives support. Entrepreneurism is vital as entrepreneur's push technological change and innovation, consequently generating economic growth. Bio-energy entrepreneurism is the focal point of this chapter, along with entrepreneurial motivations, opportunities and market drivers. Market drivers include government policies, trends in energy use and progression of the energy sector into more renewables. Several factors influence entrepreneurs, which involves several factors ranging from the environment to economics, pioneering spirit to social factors. With the help of entrepreneurial motivations and market drivers, individuals can easily visualize and plan all the bio-energy sector opportunities. Bio-energy entrepreneurs moderate the market of transformation of biomass to energy. The bioenergy field is filled with stories of failures, successes, and everything in between. There is a marginal difference between a failure story and a success story in the modern bio-energy sector, which narrow down to timing.

The fourth chapter emphasizes the biofuel policies in India and the associated barrier of policy helps to understand the opportunities to initiate the entrepreneurial journey. Energy is one of the most precious and demanded commodities among various industries and consumers to sustain the current lifestyle. Energy is a crucial element, which unswervingly influences the country's economic development. Numerous methods are adopted to reduce global warming, embracing clean energy from wind, solar, and biomass sources. To bring these technologies into reality, it needs to undergo several phases, considering the technology development, environmental sustainability, economic viabilities, and conclusively with the government support in terms of public awareness and effective policies appropriate Research and Development efforts could overawe every variable, but it can be achieved only through an effective policy. Therefore, to begin with, this chapter speaks about the current situation of energy demand, the

IP Address: 223.238.231.239

innovations in biofuel sources, and the obstacles regarding the commercialization and production of microalgal biofuel.

The fifth chapter refers to greenhouse gases, challenges, effect and climate change, puts emphasis on the release of greenhouse gases and their impact on the environment by means of increasing the global warming. Weather patterns alter over decades or longer periods of time, which is referred to as climate change. Natural and human forces both contribute to climate change. Since the Industrial Revolution, humans have contributed to climate change through emitting greenhouse gases and aerosols, as well as changing land use, resulting in a rise in global temperatures. More storms, floods, droughts, and rising sea levels may result from increasing global temperatures, as well as the melting of ice sheets, sea ice, and glaciers. The planet receives energy from the sun's radiation. GHGs are necessary for trapping heat and maintaining a temperature that permits life to flourish on the planet. The greenhouse effect is a natural and necessary phenomenon for life on Earth to survive. If the greenhouse effect didn't exist, the world would be around 33°C cooler right now. Humans have contributed to a rise in atmospheric GHGs as a result of increased fossil fuel use and deforestation in recent decades. The rise in GHGs has been the primary cause of global warming during the last century.

The sixth chapter signifies the production of biofuels from the biomass and biowaste. The cost of production of biofuels can be reduced by utilizing the biowaste and biomass for the production purposes. The planet's limited natural fossil fuel reserves are anticipated to be very soon owing to massive usage. Biofuels would be a critical alternative source that may reduce global warming and CO2 emissions. The food-versus-fuel dilemma is, however, one of the key drawbacks of first-generation biofuels like Corn ethanol, sugarcane ethanol, etc. Cellulose and hemicellulose, the primary constituents of lignocellulosic feedstocks, could be reduced to sugars by thermochemical / biological processes before being fermented to generate biofuels. However, owing to structural heterogeneity, more complicated operational techniques are required before the production technology can be commercialized and several challenges must be addressed. This book chapter provided an assessment of various feedstocks, availability, various processing techniques, obstacles, and current technical developments in the generation of biofuels from biomass.

The seventh chapter emphasizes the biogas generation from the renewable sources under a specified condition. The importance of biogas is in reducing the dependency on the non-renewable gases which can be produced using household wastes too. Biogas is a renewable natural gas used in production of energy which is generated by breakdown of organic matter by anaerobic digestion. It is a composition of methane, carbon dioxide and some other gases in small quantities. The most common natural resources for production of biogas are aquatic sediments, animal waste, crop residues, wastewater sludge and many others. Some other sources are landfills, water lagoons etc. which are a result of human activity. There are several technologies used for biogas production, mainly- biodigesters, wastewater treatment plants and landfill gas recovery systems. Production of biogas is highly dependent on the feedstock availability and the policy support by the government.

The eighth chapter signifies the importance of algal biomass on reducing the malnutrition cases across the globe. The protein rich algal food can be used to enrich the health upon consumption. With the increasing population, there are problems like the shrinking of arable land, pollution and feeding the entire growing population high-quality food and reaching consumer demand and the list goes on. Novel superfoods are rich in nutrition and produced with the most sustainable methods, including Algae, specifically microalgae. Microalgae have been studied for decades. Microalgae are one of the largest and most poorly understood organisms on planet earth but, in recent years the research has been increased for the search of renewable and sustainable energy sources. Microalgae don't require much land for

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

cultivation and thus do not compete with conventional agricultural land. Microalgae can grow in double their size in 24 hours.CO2, solar rays, inorganic nutrients, and water are the basic requirements for them to grow. There are microalgae and macroalgae (eg: seaweed) that grow in saline and hypersaline water. This Chapter presents the promising potentials of algae (microalgae and macroalgae) as a superfood.

The ninth chapter focuses on the production of bioethanol with using macroalgae biomass. Macroalgae are known to accumulate the starch which can be used to accomplish fermentation to produce ethanol as an important biofuel. Steep rise in human population together with the simultaneous growth of urbanization and industrialization has triggered overuse of fossil fuels in the recent years. However, they are non-renewable and release carbon dioxide causing global warming. In this context, biofuels come as excellent substitutes because they are renewable and eco-friendly. They are obtained from biological products and include biodiesel, biomethane, bioethanol and biohydrogen. They are classified into first, second and third generation fuels depending on the biological feedstocks being used. Of these, the third-generation fuels, obtained from marine resources like algae have attracted special research interests because they do not rival the food crop production or depend on land and freshwater for their cultivation. However, the potentialities of macroalgae as a biofuel resource have not been investigated thoroughly. The current chapter tries to outline all the aspects of biofuel production from macroalgae pointing out the scopes for future research.

The tenth chapter signifies the methodology to produce the biogas in the form of gas hydrates. The gas hydrates in future can be efficiently used as an alternative source to the non-renewable gases. This can be produced from the waste biomass to make cost effective process. Natural Gas Hydrate (NGH) is emerged as a future source of energy for the world which can fulfill the future energy demand. The natural gas hydrates hold the twice amount of energy more than all available fossil fuels. At present, the energy demand is growing, but these are not available commercially. Various field applications on the dissociation of the natural gas hydrates have been performed till now and the output of these field applications confirms the possibility of dissociation of the natural gas hydrates. At distinct locations in the world, the huge deposits of hydrates have been identified but the safe and economical dissociation of gas hydrates is not known yet. Hence, the evolution of new and inexpensive, suitable methods and technologies are required for the dissociation of gas hydrates. In this chapter, we reviewed several articles to compare the different dissociation techniques of gas hydrates and their field applications. The advantages and disadvantages of these production method has also been discussed.

The eleventh chapter describes the use of microalgae to accumulate the lipid into them which can be transesterified to fatty acid alkyl esters. The process uses the cost-effective approach to culture the lipid accumulating microalgae on the wastewater and thereby harvesting, extraction, and transesterification of alcohol. Biofuels have gained significant interest as an alternative fuel in recent years owing to their environmental sustainability, cost-effectiveness, and the ability to blend with traditional fuels like gasoline without requiring engine modifications. The use of microalgae for biofuel production is universally preferred due to its energy efficiency and environmental sustainability; Current research is geared towards enhancing the production of microalgae-biofuel from the initial stages to the final product as it is a cost-effective fuel option. The use of different types of nano-additives at different stages of microalgae cultivation and incorporation into biofuel produced noteworthy improvements in the final product. This chapter focuses on the prospective uses of nano-additives in microalgae cultivation, microalgal biomass conversion to biofuels, and biofuel combustion improvement for revolutionary advancements in biofuel technology.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

The twelfth chapter emphasizes the macroalgae based ethanol production in which the carbohydrate rich algal biomass is utilized to ferment into ethanol under anaerobic conditions. The chapter discusses the methods effective for the extraction of useful energy from the macroalgae biomass including liquefaction, anaerobic digestion, fermentation to biobutanol, trans-esterification to biodiesel, pyrolysis, direct combustion, fermentation to bioethanol and gasification. However, if the algae are suited for the production of biodiesel can be studied from the content of their triacylglycerols (TAGs). Due to having high fatty acid content they have a high conversion rate to biodiesel, and the lack of sulphur, phosphorus and nitrogen also aids in the conversion. This chapter highlights the limitations and suitability of macroalgae for the conversion process in reference to chemical composition, process optimization and cost effectiveness. It is concluded bio-oils and bioethanol produced from wet macroalgae are considered over biodiesel production because of high lipid content of microalgae biomass. Moreover, the chapter considers electricity production from the dry mass as it would turn profitable and this can be achieved from fast-growing macroalgae like "Ulva".

The thirteenth chapter clarifies the challenges and potential associated with the lipid accumulating microalgal biofuels. Development of sustainable energy resources is a major concern in front of scientific community and stakeholder of this field. Invariably, fossil fuels are utilizing to meet the major part of energy demand all over the world but its stocks are limited. Burning of fossil fuels also causes significant environmental pollution that results in drastic climate changes. There is emergent need of an alternative to fulfill the current energy demand in a sustainable way along with sorting out the pollution issues. Microbial Biofuels could be the most appropriate choice in this regard because it bears enormous potential that needs to be exploited. But it has some challenging issues to employ it to meet out the current energy demands. This chapter illustrates the microbial biofuels, harvesting techniques, different process and potential to utilize it as sustainable energy sources along with considerable challenges that need to be addressed to make it as an eco-friendly and economical fuel choice to pave the path of sustainable development.

The fourteenth chapter signifies the importance of microbial cellulase enzyme in the bioenergy. The cellulase enzyme is used to hydrolyze the lignocellulosic biomass to their monomeric subunits, i.e., glucose which can be used to do fermentation to produce bioethanol. Bioethanol from inedible cellulose - rich biomass is the most promising candidate to replace fast depleting, environmentally polluting fossil fuels. Hydrolysis of cellulose to glucose is the crucial step in its biotransformation to bioethanol. Enzymatic hydrolysis is favored over acid hydrolysis, as enzymes are eco-friendly biocatalysts with high substrate specificity and superior catalytic efficiency in mild reaction conditions. Complete hydrolysis of cellulose is achieved by cellulase. Higher cellulase production yield, stability and catalytic efficiency are the main attentive points for the successful implementation in industrial production of bioethanol. This chapter will highlight general characteristics of microbial cellulases and their role in bioconversion of cellulose to biofuels, economic sustainability of cellulose-based biofuels and the latest innovations in cellulase immobilization as the most comprehensive strategy for improvement of enzyme stability, activity, and reusability for cost-effective large-scale application.

The fifteenth chapter describes the comparative studies on the biodiesel productions using neem and jatropha oils. Sustainable development is key aspect of modern-day development. Reducing fuel cost and emissions is considered as the most important research area in sustainable development. Biodiesel has the potential to reduce the requirement of petroleum diesel if blended in suitable proportion. Various feedstocks are being explored for biodiesel production. Oils derived from neem and jatropha can be utilized for biodiesel production. In the current investigations, Optimum parameters for the production,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

namely catalyst proportion, temperature, oil to alcohol ratio were optimized. Experiments were carried out at different blend proportions to study fuel properties namely kinematic viscosity, aniline point, diesel index, flash and fire points, specific and API gravity, cetane number and ASTM distillation characteristics.

The sixteenth chapter denotes the characterization and comparison of various blends of Honge oil methyl esters with the diesel fuel in order to reduce the air pollution and fossil fuel dependency. The Honge oil, known as pongamia oil is one of the most widely used oil around the world as lamp oil, in leather tanning, in soap making, and as a lubricant. The Honge oil methyl ester can be used as an alternative fuel for diesel. The transesterification of methanol and Honge oil in presence of base catalyst results in Honge oil methyl ester. In the current work, the Honge oil methyl-ester known as biodiesel was produced. It was mixed with petroleum diesel fuel in different proportions. Various physical and petroleum properties were investigated for Honge oil biofuel and also for various diesel and ester mixtures. The optimum parameters were, temperature was 65 0C, catalyst quantity, 0.4 grams and oil: alcohol ratio, 1:6. The blends of 10%, 20% and 30% compositions were most suitable as potential alternative fuel. Different proportions of biodiesel ester in diesel fuel have been also compared with petroleum diesel fuel to identify suitable blend having good engine fuel potential.

The seventeenth chapter signifies the biomass-fed anaerobic digesters in semi-arid areas. The mitigation of adverse climate change requires holistic strategies. The strategies include the proper handling of biomass wastes such as cow dung. The handling of the wastes has to be efficient using appropriately designed anaerobic digesters. In addition, the operating-status of these digesters has to be monitored for detection of any fault of the digesters. Unfortunately, existing approaches for designing and monitoring the working condition of digesters have limitations. This chapter presents the innovative and explicit conceptual design approach of adapting the biomass-fed anaerobic digester and the digester operating-status-indicators in semi-arid areas. The approach is recommended to the renewable energy system designers. Finally, the appropriate indicators are recommended to be applied by the biogas plant operators or users.

The eighteenth chapter emphasizes the different ways to pretreat the lignocellulosic biomass to remove the lignin so that the access to cellulose is improved efficiently. Rapidly depletion of fossil fuel-based energy sources increased the demand for alternate energy sources. Lignocellulosic based 2G ethanol can be used as an alternative sustainable source that present in ample amount. Sources of lignocellulose biomass are wood, food-agriculture wastes and forest residues. Cellulose, hemicellulose, and lignin are the core components of lignocellulosic biomass. Cellulosic and hemi cellulosic biomass are enzymatically hydrolyzed to produce the monomer sugar (such as glucose or xylose) which is further converted into ethanol using fermentation process. The presence of lignin provides physical barrier that limit the access of enzymes required for saccharification. Pretreatment helps in removing the lignin from biomass and reduce recalcitrance. Pretreatment can be done by conventional methods which are chemical, physical and biological method. This study covers the different methods of pretreatment including their disadvantages and benefits along with saccharification and fermentation processes.

CONCLUSION

The Paris Agreement on climate change and the Sustainable Development Goals (SDGs) create momentum for international joint forces to combat climate change. Bioenergy, which represents a significant type of renewable energy is key to supporting the agreed SDGs, particularly in the context of energy security, sustainability, and economic development. Bioenergy is considered the most problematic area among

renewable energy sources – with multi feedstock, technology and diverse energy carriers. Presently, several novel physical, chemical, and biological routes are used to produce renewable bioenergy. In India, crop biomass availability is estimated at around 500 million metric tons per year and can produce energy equivalent to 18,000 megawatts. It shows a bright future in energy production in India if adequately used.

Acknowledgment

This book is the result of the dedicated effort of numerous individuals. We would like to acknowledge the help of all the people involved in this project and, more specifically, to the authors and reviewers that took part in the review process. Without their support, this book would not have become a reality.

First, we would like to thank each one of the authors for their contributions. Our sincere gratitude goes to the chapter's authors who contributed their time and expertise to this book.

Second, we wish to acknowledge the valuable contributions of the reviewers regarding the improvement of quality, coherence and content presentation of chapters. Most of the authors also served as referees; we highly appreciate their double task.

Additionally, we would like to thank our Editorial Advisory Board.

Our Production Coordinator skillfully managed the production of the textbook. We wish to thank the publisher for the sustained interest shown by him during the entire work. A sincere expression of the thanks goes to the entire staff of IGI Global.

Generous participation of faculties and students to eliminate errors in the text and to eliminate errors in the text and to refine the presentation will be greatly acknowledged.

Last and not least, we beg forgiveness of all those who have been with us over the course of the years and whose names we have failed to mention.

Chapter 1
Bioenergy: Social, Economic, and Environmental Impacts

Shweta Arun Avhad
Savitribai Phule Pune University, India

ABSTRACT

As we know that escalating population demand and technological advancement lead us towards a new world dominion power, but with that, there is huge pressure on resources due to an increase in consumption at all levels globally. This leads to revamping environmental motifs all over the world and non-renewable sources are estimated to be not rehabilitating soon. In this case, bio-energy is energy presented as a major opportunity to address the issues of climate change by reducing carbon emissions. This chapter explore bioenergy.

INTRODUCTION

As we know that escalating population demand and technological advancement lead us towards a new world dominion power, but with that, there is huge pressure on resources due to an increase in consumption at all levels globally. This leads to revamping environmental motifs all over the world and non-renewable sources are estimated to be not rehabilitating soon. In this case, bio-energy is energy presented as a major opportunity to address the issues of climate change by reducing carbon emissions.

BACKGROUND

Bio-energy can be defined as a flexible renewable energy source that can be obtained from organic matter, which includes husbandry, and food waste, forestry sector includes timber, also sewage, and so on. In this, all energy is obtained from a biological source, which produces heat energy (thermal energy), electricity or power, transport biofuel, cooling purposes, etc. Bio-energy makes up nearly 15% of global primary energy consumption substantially from fuel wood and 50% of global renewable energy sources.

(Gheewala Shabbir, et al., 2011). Unlike other renewable energy sources, bio-energy spare on a raw material feedstock that can use within energy processes.

BIOMASS

Bioenergy is energy deduced from biomass. It has appertained as a material which is produced by photosynthesis and which is residue from husbandry, forestry, and related diligence, a beast and vegetal composites, algae, fungi, and biological wastes which all are of biological origin and are biodegradable. They are obtained as feedstock in the manufacture of bio-oils, biofuels like petrochemical substances, and other products. The key challenge for bioenergy is arising due to changing environmental substitute patterns that adversely affect the supply chain of biomass, as it is sensitive to environmental impacts. This change in biomass use for energy has an insinuation associated with changes in land use patterns, which affects the subjection of biodiversity to feedstock production.

In this chapter, we are going to discuss the impacts of bioenergy socially, economically, and environmentally.

As its major threats of bioenergy have not been instigated at greater risk for the world, yet hence it seems to be a good solution for now. In short, bioenergy can act as a key part of a future demand solution. According to the IEA Bioenergy report, bioenergy includes efficient and increasing the sustainable use of biomass for biomaterial production. Also, power and thermal energy for transportation purpose as the major opportunity to reduce carbon dioxide emission including clean efficient renewable energy solution this efficient source act as an alternative source of energy for non-renewable source for sustainable bioenergy use (IEA Bioenergy report, 2020). This also helps to step forward to achieve sustainable development goals.

According to IPCC (intergovernmental panel on climate change) 6^{th} assessment report, global temperature speed up in the last 100 years and reach its peak and in the next 20 years, global warming will breach the threshold of 1.5 degree Celsius. If GHG (greenhouse gases) continue to emit global warming, will be above 2 degrees Celsius by the mid-2100s. The rise in sea level started affecting sea-lined countries and Small Island are at greater risk .as per researchers, this bioenergy can act as a stabilizer to control GHG emission and help to reduce extreme weather events. Nevertheless, demand for bioenergy feedstock increases due to bioenergy demand escalating, this feedstock is primarily sowing the seeds of agricultural and forest material. The IPCC determined that the average amount of BECCS(bioenergy with carbon capture storage) in the climate framework requires 25 to 45% of fertile and permanent cropland that is nearly 6,500,000 km square of area up to the next 80 years (Vaughan, A., 2021). Hence, to keep our energy supply pristine, bioenergy must emanate from sustainable resources. This biomass production to derive bioenergy should not affect food material production. Impacts on the environment (including animal welfare, plants, air, water, and ecosystem) must be superintended aptly. LUC i.e. land use consumption has to be sustainable.

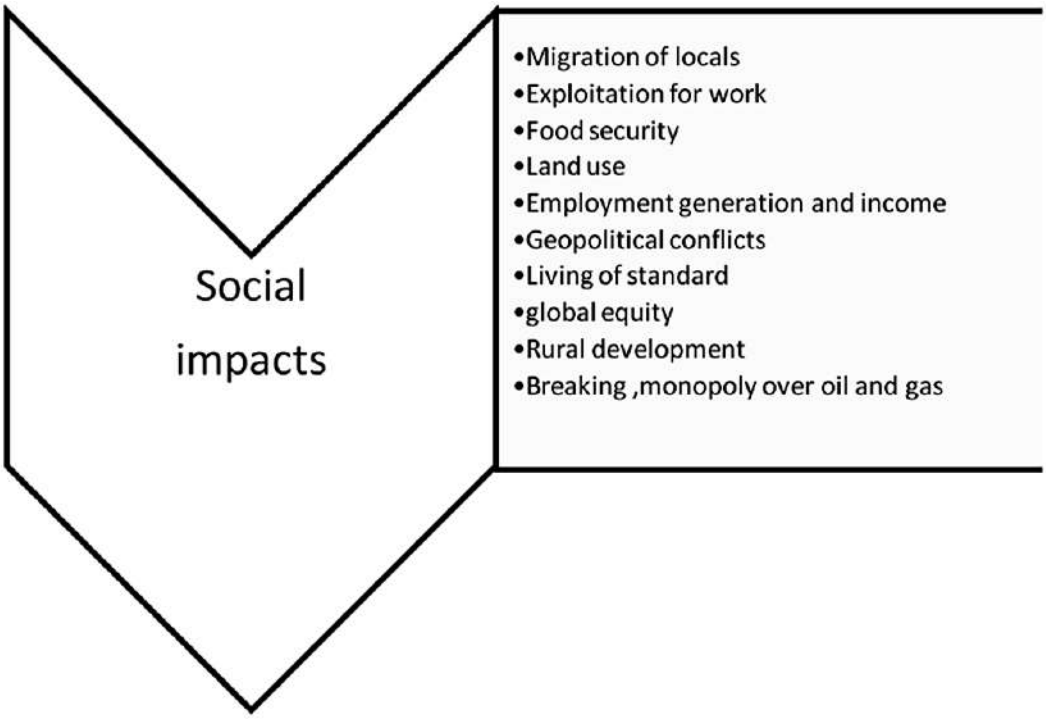
IMPACTS OF BIOENERGY

Bioenergy is act as an alternative to fossil fuels, and energy suppliers and increases the energy security of rural communities. Further, it has accommodated sustainably and carefully towards affecting socially,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

also feedstock affects economically and a limited amount of land, water, the environmental condition affects environmentally. These effects may be positive or maybe negative hence; we can say its impact is having both aspects.

Figure 1.



Social Impacts

Bioenergy, which is executed in different forms, has an impact on society. They vary from the merits of new job opportunities, public support, awareness among the people, food security, and water quality to its demerits of societal conflicts arising due to geopolitical regions inflation due to reducing food agriculture land due to changes in land use pattern. There are many factors, that sculpt the rate of change of bioenergy and its consumption demand depends upon local and regional factor influencers. We can see the impacts of bioenergy in a stepwise manner as follows:

1. Poverty Reduction

Uses of bioenergy require biomass, which can obtain from land use. In developing, nation's agriculture is still the dominant sector and has increased population pressure in many such countries. In addition, some agricultural pastureland produces marginal food. However, the introduction of biomass production from following crops like corn, sunflower palm, etc. leads to the production of biofuel such as corn

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

ethanol that is used in transport goods. Even in many countries, petroleum products blended with ethanol are used in the markets.

E.g. For India's ethanol blending program in accordance with national policy on biofuel, the government has set a target of 10% ethanol blending by 2022 to 20% in 2030. This has environmental effects too which we can see in the next part on environmental impacts. As a part of a social impact, this leads to an increase in demand for biofuel, which is a sub-component of bioenergy and causes an increased demand for biomass that leads to giving farmers a side income profit that helps them to reduce poverty and become wealthy. Nevertheless, that increase in prices limits the supply of food products as farmers may shift towards commercial farming rather than food supply. This may also affect the global level prices, causing deficiency in food products.

Then a Question Arises: What Is Biofuel?

Biofuel is a term for a natural form of a solid-liquid or gaseous fuel, which is, arises from biomass processing from crops like jatropha, corn, sugarcane bagasse, algae, etc. and releases energy which acts as a renewable neutral source and act as an alternating option for fossil fuels. They can convert chemical energy to electrical energy.

We can segregate biofuel generation based on four criteria i.e. 1st generation of biofuel is from Starch, sugar, fats, and oil from plants and animals.

2nd, lignin, and cellulose by enzymes or by gasification include municipal solid waste, agricultural residue, forest residue, 3rd from algae, 4th from vegetable oil, and biodiesel. Here Liquid biofuels are biodiesel, bioethanol, bioethanol, bio ethyl tertiary butyl ether, etc.

2. Job Creation

At a societal level, the global climate bash often orientates with inherent support for bioenergy needs. This leads to creating job opportunities for many unemployed generations both from rural to urban levels. At the primary level of agriculture, harvesting bioenergy products from Jatropha curcas is labor intensive and can lead to generating job opportunities and income for rural employers, which are laborers, farmers, suppliers, transporters, etc.

In addition, these are used in Transport biofuels, which act as a fast-growing new energy sector due to their demand. Hence, it will emerge as an important part of energy in the next few years whose hunger even started from now. This increase leads to the development of markets for agricultural components. (BBSRC Bioenergy Dialogue - Report on a pilot public dialogue, Dec. 2013) e.g., INDC (Intended Nationally Determined Contribution) under UNFCCC –in India PANCHAMITRA mission has a target of - 40% energy from renewable sources by 2030.

3. Standard of Living Increases

Bioenergy affects people not only environmentally, but socially well-being too, which helps to reduce casteism between communities within the intercountry or intra countries level. As this energy has, the potential to produce employment that directly affects the income of people mostly to rural middle-income class people to live a free life from a debt gravl income generation. In addition, this energy in the form of renewable energy reduces the high cost of electricity bills from coal and gives eco-friendly energy

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

from available sources without any load shedding effect and unlimited access to energy that indirectly improves their living standard.

This leads to awareness among the people about the need for bioenergy and its social impact on their livelihood. This often indirectly promotes the children and youngsters towards school and college for education. According to the report of UNICEF (United Nations of children's fund), many children mainly from the African continent are still facing problems in education. Due to poverty, hunger, non-availability of standard living due to unemployment, and social conflicts in their barren lands like the Sahel area (including countries of northern Africa like Niger, Mali, Burkina Faso, Chad, and Sudan where the great green wall project established to restore greenery. Which are unfolding their climate change crisis desertification, rainfall variation, land degradation, and erosion) these situations discourage children from education. Hence, in such areas bioenergy production and its distribution can act as a catalyst to trigger the standard of living. This is also applicable to many under-developed and developing countries. Also in developed countries like the U.S.A. bioenergy now seems to be a new solution to deal with the oil crisis and stabilize their currency and power, which in short maintains their living standard.

4. Land Use

Geopolitical Conflicts

Social conflict arises due to the need for land use for primary sources and the need for bioenergy production via agricultural biomass. Conflicts between people asserting clientele rights over lands, this cause inconvenience and problems to any scheduled program.

When it comes to the production of energy from biofuel and needs employers to fulfill company needs may arrange facilities for an employer near the biofuel. Projects cause centralization of the working population with their families in distributed areas or cotters but this increasing population may result in a metathesis reaction of farmers from their traditional land site. This may result in land ownership problems called proprietor conflicts.

Case Study

Forest living tribes, in eastern Asia Penan nomadic tribal community living in Malaysian island Brunei fighting a long conflict with palm oil companies because their territorial boundaries were declining and their natural surviving sources used without permission become illegal, which leads to face environmental impacts over their territorial lands due to energy consumption.

In addition, the greatest impact on the urban socially and economically backward class arises because they do not have enough land for taking advantage of bioenergy projects.

What Is a Metathesis Reaction? How Is It Connected?

Generally, this word metathesis is used in chemical reactions, which is also called a double displacement. When two bonds exchange between each other or to a corresponding substrate it formed as a new product known as a metathesis reaction.

It is represented as - AB + CD ® AC + BD. In this equation, B and C replace their positions.

If we interlink this phenomenon to the social impact on land use consumption due to bioenergy projects or any other such projects we can find out that like the new product form in the above phenomenon

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

by interchanging constituents the farmland can be interchange or conversion take place due to such product implementation.

5. Societal Gap

Such type of projects for bioenergy implementation is strongly favored by the renewable concerning party (here it means environmentalist or public in support of bioenergy) while there is another group present that opposes it and disapproves of the project held at the local level. They are having such reasons to oppose like:

1. Bioenergy projects hold people's traditional land that they (landholders) do not want to give for any purposes.
2. If it has future impacts, it may hazardous for maintaining sustainable balance.
3. It can generate waste.
4. If the implementation is improper may be due to corruption, held under the name of a bioenergy project.

In addition, there is a lack of updated data on bioenergy from the local level to the national level to a global level. Because of idiomatic biomass and laborious challenging technology, it is difficult to gather information at the local level. This internal challenge needs to be in a focus on bioenergy project successions.

6. Political Interference

Increasing conflict or societal gap that emerges as an opportunity for some political leaders to make it a big issue rather than solving or awakening people, they use this topic to collect votes in their favor, which is a harsh reality in society.

Global Equity

A broad range of international organizations ensures sustainable and affordable bioenergy and supports the formation of international collaborations.

In 2017, fossil fuel consumption in Asia is nearly 50% of the global supply. While EUROPE and America account for 47%, hence to tackle future energy crisis as many continents and countries in dependent on primary fossils primary energy supply fossil fuels there is a wide scope of bioenergy, and its sharing among friendly nation increase global equity (Global bioenergy statistics, 2019).

E.g.- ISA international solar alliance including 100+countries is a major bioenergy project from solar technique to generate energy that is renewable, once implemented they have a longer shelf life and no electricity bill this helps to encourage the world for shifting toward eco-friendly technologies and increase its global partnership.

Waste to Energy

Municipal waste includes domestic waste, which is biodegradable and utilized for energy predominantly in urban areas. In this situation combustion of waste product, take place. After processing various times,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

dry waste collected by municipal corporations is converted into bioenergy. Such energy is used in the generation of electricity, fuel for vehicles, and thermal energy for domestic use. This technology helps to reduce waste and recycle it for social and environmental well-being. However, with that, there is a problem of segregation of this domestic waste. Hence, we can be defined it as ‘’It is the process of generating energy in the form of electricity from the primary treatment of a waste converting it into a source of fuel. ‘It is one type of energy recovery from biowaste.

Figure 2.

7. Breaking Monopoly Over Oil and Gas

Petroleum resources are mainly found geographically in the regions of west Asia like UAE, Saudi Arabia, Oman, and Yemen and they extracted it more than any other country and rise from poor to developed economy. It does not mean that other parts do not have reserves of fossils but they have not been explored yet. Some parts of the American continent hold much amount of natural reserves of fossils but have not been extracted yet in that mount and location finding is still in progress. Although, most countries depend on imports of petroleum products from these countries. In addition, faces crises called oil shocks during regional conflicts, world wars, etc. hence bioenergy is a solution over them to break the monopoly of these countries over oil products.

Economical Impacts

Bioenergy can be a cost-effective solution over costly non-renewable fossil fuels. This can lead to a major economic impact due to its availability biomass production cost, processing cost, then supply chain cost, budget, accelerating transition and creating an alliance, open access consumer, captive power plants,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

income effect, open access to the consumer. According to a recent study, researchers reveal that increasing investment in the bioenergy sector and its overall processing from production to distribution may step towards a wealthier economy if implemented profoundly. The increasing importance of bioenergy constrains organizations like FAO (Food and Agriculture Organization), and OECD (Organization for Economic Co-operation and Development) to make a framework for sustainable use of bioenergy.

Economical impacts are as follows:

1. Capital Investment

Non-renewable energy resources such as fossil fuels have some lacuna. Like, a slow rate of production leads to generate pressure on a course due to its high demand leads to price inflation and mini oil shocks situations whereas Bioenergy products are less expensive and diverse than fossil fuels like petroleum, diesel, and kerosene, which significantly affects the economy. It has great future capabilities ahead hence; there is a huge chance of increasing investment in bioenergy projects. In addition, this bioenergy feedstock material is harvested locally and they are abundantly available making it a sustainable and self-sufficient source of energy. Hence, it is the center of attraction for investors and helps in economic gain.

E.g. - Bioenergy projects such as the biodiesel industry generated $21.6 billion which greatly and positively affects countries economy of the United States. It approximately created thousands of job opportunities.

2. Industry Engagement

As capital investment starts rising, many different companies meet to discuss, projects and their analysis, which procure exquisite understanding among the companies or industries, forming a cooperation alliance among them.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Figure 3.

3. Price Stability

According to FAO, a larger country produces the most reliable estimates than poorer countries. It is common that larger and wealthier countries to have modern techniques and analysis of estimated bit in case of poorer countries have to depend on outdated surveys and they have to face technical deficiencies. Sustainable bioenergy is beneficial for the price stability of both developed larger countries and poorer countries. As we previously discussed that it generates income source and employment, and help deprived people to overcome the debt trap. Schemes like feed-in tariff (FIT) are helpful for bioenergy elaboration that include domestic to municipal and small businesses to be benefitted from it and also from its social acceptance and awareness about it.

Case Study

Hawaii is a small island in the Pacific Ocean 2000 miles away from the U.S. mainland and is mostly dependent on foreign nations to attain fuels like petroleum products, natural gas, and coal as it lacks when it comes to its own fossil reserves. Which greatly increased their expenditure cost on electricity but they found a resilience strategy. They started to use renewable sources like bioenergy from biomass, this helps to save the economy of the country and make it sustainable energy supply. Investment factor also helps them in such projects.

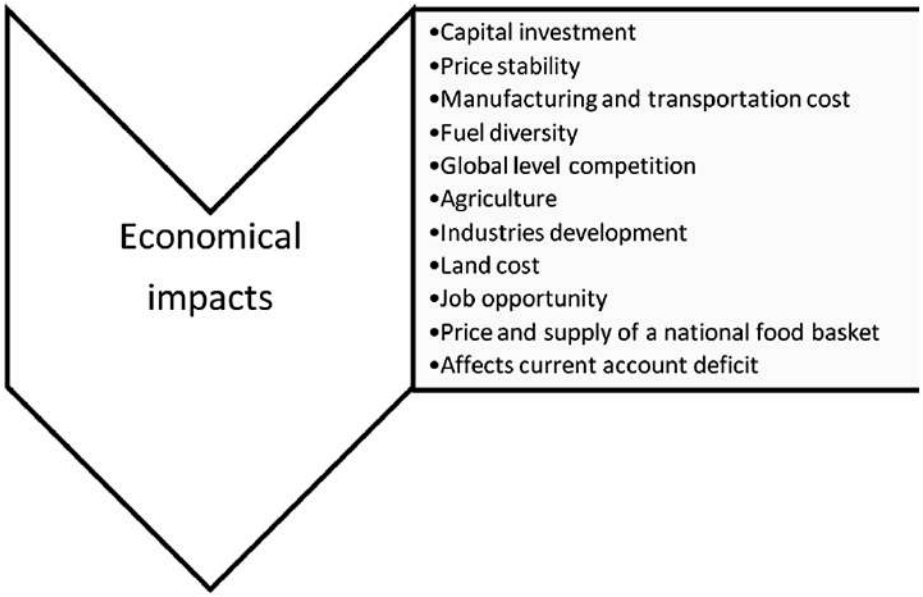
Figure 4.



4. Logistic Support and Supply Chain

For the development of bioenergy, it is impossible without including logistic support, which acts as a vertebra for bioenergy gaining. Because energy, produced has to transport to deprived sectors or interchange fossil fuel consumption there is a need for logistic support. From the start of the project, its basic needs, important components, facilities gained from these resources, handling, processing until packing and distribution of materials. Hence, we can say it is a catalyst of energy. This socially empowers people by giving them employment.

Supply chain management, from the implementation of the project, and its location to emission and energy cost need to account for under logistics. Nevertheless, with that, it has negative aspects too. Transportation act as a costly component of bioenergy. It is prominently seen because a measure of bioenergy has lower energy and less volumetric solidity than petroleum products obtained from underground. In some countries, the cost for supply management use is very high than the actual budget, leading to a developing financial crisis. This is because of, a long distance from the location to the distributor, roadways condition, traffic, pipeline management, and waterways having an issue of time consumption due to port management was inappropriate leads to delay loading and unloading in some countries but countries like Philippines exception to that. Bioenergy is the second largest employer globally with approx. 3.2 million people working in the bioenergy supply chain (United Nations Development Programme, 2020).

Now the Question Arises: What Is the Concept of Catalyst?

A substance, which does not take part in a chemical reaction but by its mere presence, can speed up or reduce the speed of any chemical reaction known as a catalyst, and the phenomenon process is called catalysis.

IP Address: 223.238.231.239

5. Manufacturing Cost

Manufacturers are mostly concerned about cost factors and revenues in any project, bioenergy projects are going from this phase of the cycle. We can say it is a bioenergy production cost. From a bioenergy production point of view, the manufacturing cost is considerably less than that of fossil fuel. However, along with that new implementations have to be made like reserve capacity building has to be increased this is the part of impact assessment. Another impact is different countries have different currencies from the American dollar, and European euro in the west to the yen in Japan, the Cambodian rial, Kuwaiti dinar, and Indian rupees. In these currencies, there is a huge gap in the international market. Which can create an imbalance (there are international organizations to make a balance IMF international monetary fund, which makes the balance of payment BOP) hence, when it comes to importing or exporting feedstock material or basic manufacturing products it may be costly or cheaper. And manufacturing companies find their profits by importing at a cheaper cost but the exporting countries also do not have to be in loss because the purpose of introducing bioenergy is to make sustainable development but along with that it also helps to secure or develop living of standard by giving many employment opportunities and income economically.

Figure 5.

6. Price and Supply of a National Food Basket

According to research, bioenergy affects domestic food supply and affects food baskets due to reversal stipulation in a food market, climate change pattern affecting agriculture hence agronomics cost also fluctuate un accordingly this may cause inflation. Causing inflation greatly influence both international and local level. Many countries have already undergone food crises due to many reasons like financial crises, conflicts among nations or internally, environmental violating influences, etc. Along with that agricultural land also decreasing in such cases globally contribution to bioenergy projects is wracked or seriously affected which may trap the development of bioenergy projects because in such countries

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

they are still facing primary concerns of basic requirements like food shelter and clothes. According to the Global hunger index, which is jointly published by Concern Worldwide and Welthungerhilf. Many African countries like the Central African Republic, Chad, Sierra Leone, Madagascar, Zambia, Yemen, and Sudan, are facing such a crisis. Price volatility also greatly influences their condition. However, bioenergy can be a solution for their problems not completely but leg up and lift them from a crisis. As per researchers, total biofuel consumption rises mainly in countries like China, India, Brazil, the USA, and European countries because these countries were largely dependent on fossil fuels for energy supply or fuel consumption whose prices are relatively high hence their shifting to agricultural feedstock, cellulosic biofuel, etc as another option but it leads to rise food prices too. In such circumstances, markets have to access their physical and fiscal assets. They also have to be transparent functions and efficient to contract and cope with the demand rights of people to oppose or support taken into consideration.

7. Transportation Cost

Despite the increase in the advantage of bioenergy and its growth steadily escalating, transportation is scarcely increasing in terms of bioenergy. This market gives unique opportunities to new startups related to transport facilities that boost the economy of rural and poorer sections as these small businesses have structured their business to give effective transport facilities for biofuels. Transportation of biofuels with greater attention is currently vigorously growing bioenergy sector. However, represent only 2% of total bioenergy. If improvements take place in the transportation sector could lead to quality, the wise better quality of biofuels. it seems to be one of the most feasible ways for the transportation sector and according to sources it reaches 25% in the next 30 years from the current 3%. Increasing global warming and its disastrous nature due to human over technological advancement without an impact assessment and increasing fossil cost leads to an alternate source of bioenergy in the transportation sector (UNDESA, 2006). As bioenergy is mostly produced from sustainable sources like lignocellulose compounds have had a greater impact overall.

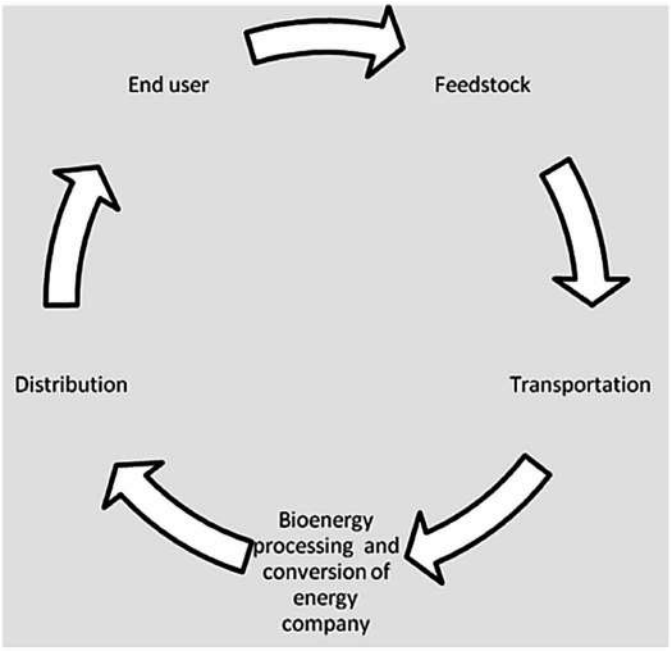
IP Address: 223.238.231.239

Figure 6.



8. Energy Cost

Bioenergy greatly decreases energy costs as we previously see an example of Hawaii. How they stable their energy cost by using bioenergy. The Electricity generated from coal (carbon fossil fuel) along with pollution is price consuming. In addition, petrochemicals are in great demand but many countries do not have their natural reserve hence their importation leads to levy taxation within countries by their governments, which affect society and their living. Reducing this extra energy demand of fossil fuels by altering them with biofuels is a need of the hour. We can see the concept of how this energy is consumed by TFSC-Total final energy consumption here counting an energy content by its total amount of energy transformation and distribution and its consumption in residential, commercial, and agriculture. Gross final energy consumption is a constituent amount of renewable form of energy consumed while energy transportation, its transmission, and distribution. We can also say that Gross final energy consumption=TFEC total final energy consumption + thermal and electrical heat consumption - are used for the non-energy sector (IEA, May 2021). In countries like India, the REC mechanism renewable energy certificate to boost green economy is implemented.

It is a tradable and legal renewable energy credit mechanism where one REC is equivalent to one MWh. This mechanism is associated with the production of renewable energy like bioenergy and encourages the generation of electricity from this source. To deal with challenges associated with it i.e., excess supply over demand REC prices remains close to ground level prices. ESCerts is also a tradable certificate under the PAT (perform achieve trade)-it aims to stimulate energy efficiency. It is a part of the bureau of energy efficiency. Certification schemes to abolish trade barriers, now and in the future

Dr. Ashok Rathoure (asokumr@gmail.com)

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

9. Global Level Competition

Due to increased investment in this sector, creates healthy competition among the different nations as it increases income and resilience for rural livelihood enterprises. Economically it has financial and fiscal incentives. Subsidies, grants, VAT i.e. value added tax a part of it, import, and export duties tariffs all act as a financial barrier to developing off-grid systems. Along with that if we look the percentage shows that In Africa according to a research report says that 20% increase in import tariffs (currently at 0%) could reduce sales of off-grid systems according to the size of products. In countries like China, it accounts for the greatest share of renewable energy investment including bioenergy followed by the United States 20% in Europe (19%). Also, investment in renewable seems to be declining in China and India but excluding these, there is a 17% gain according to researchers. The Middle East and Africa accounted for 5%, India 3% and Brazil 2% biomass capacity investment climbed 26% to USD 2.6 billion. In 2030 global demand for biofuel will increase to 90% of the current production of palm oil and other products (Gao Yan, et al, 2011). This growth in demand is driven by public incentives. Like India, its bioethanol blending mission Indonesia already make a strategy of biofuel consumption their biofuel blending increase from 5% to 30% in 2020.

10. Current Account Deficit

The high transaction cost of bioenergy for developing and underdeveloped countries may lead to an increased current account deficit (CAD-simply we can say that current account deficit means if the expenditure is more than its income from various sources and its difference called CAD

E.g., suppose bioenergy production's overall value is 2 million dollars but its consumption by distributing only collects 1 million dollars their difference is one million dollars called a current account deficit. According to economics, less amount of CAD is an indicator of increasing the economy but a large amount decreases it. Bioenergy also influences the GVA of countries which is the gross value added per unit of bioenergy production. The bioenergy sector also leads to the social stock exchange and corporate social responsibility and the digital divide. There are such impacts economically that can happen which indicates both positive and negative aspects.

11. Agricultre

Bioenergy production from 90% solid material which grown in agriculture as biomass, feedstock, and its production started to increase which is a cost-benefit to low land farmers. But to reach its peak near future and to encourage farmers to grow such biomass it's training along with subsidies and insurance in the case of natural calamities or accidental burns on the farm hence to safeguard them such formulas have to be applied. Contesting for agricultural feedstock and its land may increase food prices and farmers and from APMC markets dealers' income it may increase but net buyers will suffer from inflation.

Dr. Ashok Rathoure (asokumr@gmail.com)

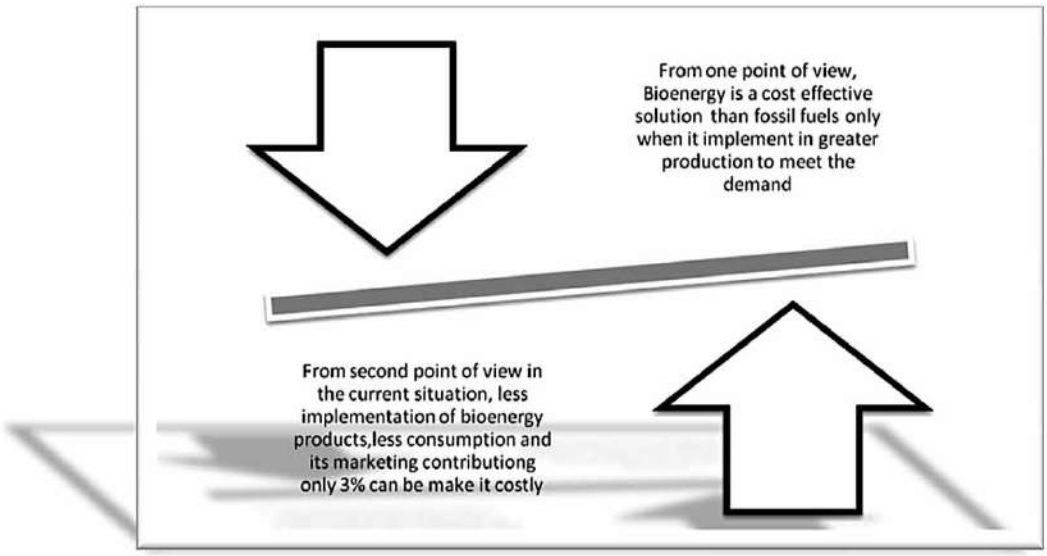
IP Address: 223.238.231.239

Figure 7.



If we talk about its positive aspects, it is economically beneficial to agriculture primary sector and agricultural laborers, but such products also not have negatively affected fertile productive land. Until now, not much such big research has taken for the evaluation of the cost-benefit ratio of the land. Bioenergy seems like grace in many sectors along with social, economical, and mainly environmental concerns but with that, we have research on its long-term impacts by EIA environmental impact assessment so, with taken safety measures we have to ensure that this grace does not convert into a curse for our future generations.

Environmental Impacts

After we have seen the social and economic impacts of bioenergy, let us move on to the environmental impacts of it. From previously seen case studies of the Hawaii area and Sarawak community, we can say that energy security along with global warming and other climatic issues needs new solutions to reduce its hazard. Bioenergy feedstock than carbon fossil fuels may be cost-effective and may contribute to slightly addressing the problem of climate change for sustainable development. Although it seems like a solution it has to highlight that, bioenergy is not a full solution for environmental issues but it can drive as a GHG emission reducer. Contribute to waste treatment in an effective way.

From local condition to various global factors depending upon a type of environmental condition, land, and soil used, its intensity, and more or less productivity such factors affects bioenergy production. An increase in demand for environment-friendly energy like bioenergy also influences feedstock, which indirectly contributes to land use competition among primary agriculture producers that are farmers. They also tend to convert food cropland to energy commercial due to price factors.

Actually, Bioenergy is not a carbon neutral source but can influence such conditions to ensure sustainable development. With the Merits of reduction of GHG (Green House Gas) and the fossil fuels, storage within minimal energy loss, wildlife health and human health, giving agriculturally marginal product

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

income, carbon sequestration, and sustainable source. Bioenergy is also affecting the cons of soil erosion, biodiversity loss, water contamination due to material used in bioenergy agricultural fields, deforestation for lands to grow biomass, etc. There are challenges in the new era of bioenergy implementation. Let us see the impact of bioenergy from an environmental point of view in detail.

1. Land Acquisition or Use

In many countries, degraded lands are used for bioenergy plantation making them reproductive land. Planting trees reduces erosion and ecology restoration takes place. To expand the production and cultivation of biofuels there is a need for a clear well research strategy to regulate land conditions.

The environmental impact of land use includes that in many developing countries small landholding farmers cannot afford its products and materials. For project managers also it is not easy to convince most farmers to introduce biomass farming from their traditional farming. Also, to their migration in case of land need for an industrial approach to change their land.

Indirect land use change in such cases may affect the environment as new agricultural places mean deforestation, which may be arable land, or aural forest and grassland may contaminate the land by using fertilizers and pesticides in such areas. (Bertzky M., et al., 2011).

Figure 8.

2. Soil Quality

Soil is an essential element in the productivity of the land. Due to climatic adverse conditions, poor agricultural practice lowers the fertility of the soil. Major effects of biomass production have not been seen in the products like Jatropha, Palm, Bagasse, algae, etc. Nevertheless, repetition of crops May leads

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

to decrease productivity as nutrients in the soil may be deficient amount. Hence, fodder of macro and micronutrients are given to such farmland to increase yield but most farmers not having actual knowledge of the quantity-wise ratio of such fodder material, which causes to decline in soil fertility due to excessive nutrients.

Agricultural practices may use fertilizers, and artificial insecticides giving rise to soil erosion due to an increase in acidic content and reduction in its water holding capacity and reducing the fertility of soil the effluents which get diffuse in water when in com in contact due to rain, river runoff near agricultural land and underground water leading to water pollution. Hence, we can see the next impact on water.

3. Impact on Water

As we know, the amount of drinkable water on land is 3% from which a large amount is in the form of ice in Polar Regions and only less than 1% of water is available. According to a report by the International Water Management Institute, the rush for liquid biofuels could worsen the water crisis in some countries. In addition, many countries around the world facing water scarcity, and global warming emphasizes it. In such a crisis, bioenergy production could add pressure on existing sources. Pollutants from the soil by agricultural fertilizers and all loaded into water bodies cause pollution. For this, some resource management has to work done efficiently to solve the issue .but on the second side encouraging bioenergy production can reduce the cost of hydraulic renewable from freshwater means energy or electricity generated from freshwater sources to ensure sustainable balance.

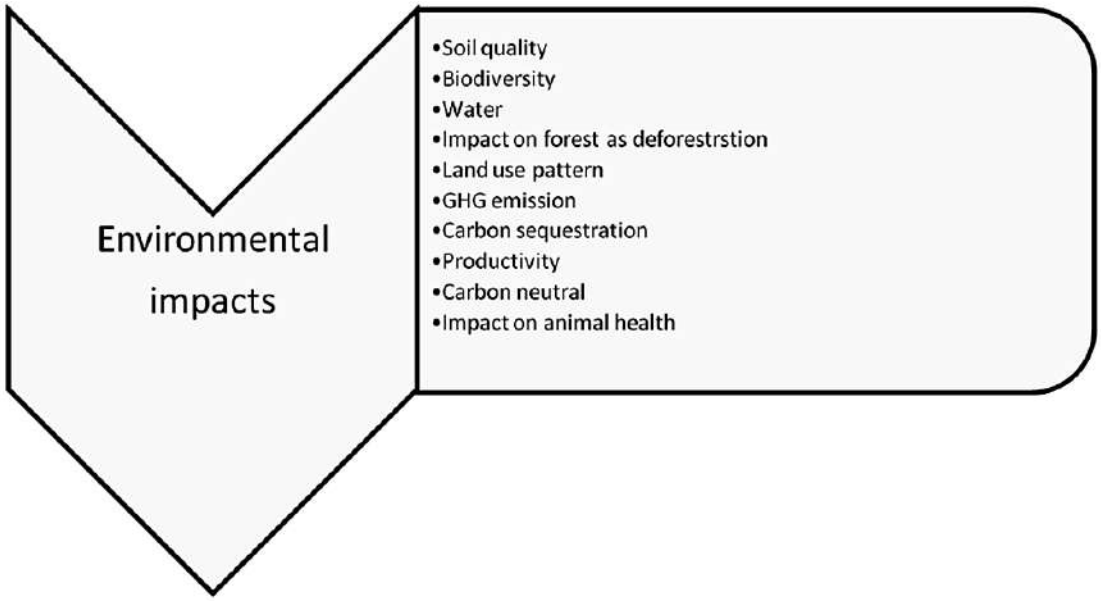
4. Forest

Forests hold a large amount of carbon and remove large amounts of carbon from the surrounding atmosphere providing clean air, water, and food, shelter for many wild species hence they play a vital role in sustainable development. In many countries, forestland is replaced by croplands or by large buildings, parks, malls, etc. From a bioenergy point of view, this forestland is replacing due to an increase in demand for biofuels and basic material feedstock which ultimately leads to increased pressure on forestlands. Lungs of the earth ‘’Amazon forest’’ is also not an exception in such case. (whereas still wood is a greater amount of energy sources across the world that act as a biofuel but its cutting and burning leads to pollution and greenhouse gas emission). Shrinking of forestland and savanna-type grassland leads to reduced feed available for animals and local people, which affects their social, environmental, and economic conditions. (Fritsche R. Uwe, et al., 2010)

Loss of forestland or its area leads to the release of more carbon, which influences global warming and biodiversity losses. According to sources, deforestation and poor land cultivation alone released 25% of carbon. (Vaughan, A., 2021). Here implementing the Carbon sequestration method helps to capture such carbon emissions from the environment and helps for better development of a sustainable environment.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Figure 9.



According to the Greenpeace report, biofuel leads to increased GHG emissions due to deforestation of forests and leads to conflicts among communities, between animals and humans, which we called as man-animal conflicts. On the other hand, some scientists argue that bioenergy reduces fossil fuel consumption and emission from it providing wealthy income and jobs to rural peoples.

Deforestation also environmentally affects the carbon cycle and nitrogen fixation.

5. Biodiversity Impact

It has been argued that an increase in feedstock production influences surrounding ecosystems. For example - ICAR NEERI in India implements a Bamboo plantation program to reduce fly ash, which is under processing. In barren and dump land introducing such species increases the greenery of that site like a small forest in less time measurably 3 to 4 years which also helps to increase biodiversity as different small insects, snakes, and bird species are now native to this area.

But on the other hand, deforestation and agricultural practices for bioenergy production reduce the space of animals for their shelter and food, emissions from biorefineries and indirectly creating noise may create disturbance and habitat loss of such species in that area. Here, natural ponds and aquatic life are affected by it.

In addition, biodiversity is under threat due to large-scale monoculture for which a significant amount of bioenergy production takes place.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Figure 10.

6. Emission of Carbon

Carbon is constantly absorbed into the trees and it leaves in the atmosphere when such plants are cut down or die. Bioenergy can be used to reduce carbon emissions from fossil fuels like petroleum, and diesel that emits carbon from vehicles, combustion of it, emission from industries, etc. affecting net carbon emission. BECCS (Bioenergy with carbon capture and storage) could remove large amounts of carbon dioxide from the atmosphere and works as carbon sequestration. However, according to some reports of researchers BECCS could not capture total carbon dioxide from the atmosphere. (Kemper J., 2015). The net energy balance concept arises when the ratio of the primary amount of energy consumed is divided by the total energy produced and to assess the net impact such impact assessment has to be done prior. (Berndes Goran, 2010).

7. Impact On Animals and Human Health

Conversion of forest land to cropland for many projects where bioenergy is also one of it, whose environmental impact also affects many species in the form of habitat loss, their changing behavioral patterns, spawning and mating seasons of animals. Due to noise pollution and excessive involvement and movement associated with creating disturbances among the animals. Animal habitat is changing its pattern. E.g. effluent from bioenergy refineries directly or indirectly dissolves in nearby river ecosystems, pond ecosystem leads to the forceful migration of aquatic animals. (Rupp, S. P., et al., 2012) In addition, increasing toxic content and extra nutrients from croplands in static water develop a HAB that is harmful algal bloom, which is dangerous for an aquatic environment. As they reduce oxygen from reaching the surface and aquatic plants and animals create a condition called a biological oxygen demand

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

also-spawning season and place of fishes fixed from their ancestral part it is an interesting fact about aquatics but effluents and water pollution divert or become a barrier for aquatics. The same condition happens in the case of terrestrial animals.

Bioenergy can have a health impact associated with it. Biomass used for cooking purposes and the unavailability of proper ventilation systems causes indoor pollution which has a long-term effect when exposed for a long time. Potential impacts include respiratory diseases, headaches, etc. however, such impact is not seen in a large amount but it is a point of concern in a rapidly changing world (UNDP and WHO, 2009).

CONCLUSION

In the above whole chapter, we discuss the impacts of bioenergy but along with that, it needs a proper solution to balance carbon levels and to deal with problems associated with it for sustainable development. As we move towards a solution it broader the bioenergy term. There can be a Suggestion as follows:

1. Environmental degradation due to deforestation, land use consumption, soil and water health, etc, monitoring from a status of environmental benefits. Such studies previously gave an idea of future risks and according to that presolution for calamities has to study.
2. Biodiesel made from used cooking oil benefits the health of the environment and the economy linked with it. Such type of new ideas has to be encouraged, also financial support to researchers and projects helps to build green energy corridors in the world.
3. IEA organizations like international energy agencies dealing with proper enactment of energy sources, their applications and impacts ensure reliable, affordable, and clean energy and its worldwide distribution.
4. Green hydrogen usage as a transportation fuel can save us from impacts. Hence green hydrogen mobility project acts on it. Hydrogen produced from renewable sources is called green hydrogen which has no carbon footprint.
5. Global energy review-assesses the direction of energy demand and carbon dioxide emission
6. Climate smart public-private partnership-Climate Resilient Public Private Partnerships: it is a toolkit used to solve the issue related to the following issue. Such type of bioenergy-related bioenergy public-private partnership can influence and spread awareness among the people too.
7. Nature-based solutions UNDP in the 2020 Human development report also called for investment in Nature-based solutions and the assessment of the environment Assessment of the vulnerability of habitats and species is also taken into consideration before implementing bioenergy projects.
8. Implementation of such impact assessment tools effectively mitigate risk linked with bioenergy production from its land use to sustainable production and consumption

The rate of expansion of bioenergy products depends upon a great deal of government policies, straightforward strategy, and foreign investments in developing countries. Taking care of these bioenergy negative aspects is also hindered.

Chapter 2
Life Cycle Assessment of Biofuels: Challenges and Opportunities

Majorie Moraa Nyasani
Machakos University, Kenya

Victor Odhiambo Shikuku
https://orcid.org/0000-0002-2295-293X
Kaimosi Friends University, Kenya

ABSTRACT

To address energy security and climate-change concerns, substitutes are needed for petroleum-based transportation fuels. In addition to electricity and natural gas, biofuels are emerging as an important class of substitutes. The promotion of biofuels as energy is mainly driven by the perspective of oil depletion, concerns about energy security, and global warming. However, results published in the past few decades present conflicting pictures regarding the energy efficiency and sustainability of biofuels. To adequately address these real or apparent contradictions, a life cycle assessment (LCA) of biofuels is indispensable. "Life cycle" refers to all stages of a process: from the cradle, that is, raw material extraction through manufacturing, distribution, and use to ultimate disposal. This chapter discusses the benefits and limitations of biofuels from an LCA standpoint. The discrepancies and strengths in LCA of biofuels are critically analyzed and opportunities are highlighted. LCA of biofuels is shown to be critical to informing policy and for practical application.

INTRODUCTION

The rising demand for clean, affordable and ecofriendly energy, climate change and global warming concerns, political agitation among nations, and the depletion of fossil-based fuels has necessitated the search and development of alternative sustainable technologies focused on renewable raw materials. Biofuels are considered to curb most, if not all, the aforementioned issues because they serve as an

alternative clean fuel with supposed reduced greenhouse gas emissions, the drivers of global warming and climate change (Somerville, 2007). The link between biofuels and climate change is attributed to the fact that biofuels are supposed to be carbon-neutral alternative sources of energy. During photosynthesis, plants get sunlight energy and CO_2 from the atmosphere to form complex chemicals that constitute the plant body. When these plants are burnt, the resulting energy from oxidation is released as heat, CO_2 is given out as well and is recycled again (Somerville, 2007). Therefore, incident solar insolation can be harvested as biomass.

Bioenergy has the potential to offer a significant contribution to clean, low carbon, and secure energy. It is also referred to as a carbon-neutral process. Biofuels are also encouraged to mitigate anticipated shortages of fossil fuels resulting from anticipated depletion of natural resources or geopolitical instability. Despite the merits of biofuels, policy frameworks developed and incentives initiated, issues have been raised concerning other environmental impacts associated with biofuels and their energy efficiency sometimes with conflicting results. As such, sustainability assessment, before adoption, from an environmental, economic and social standpoint is very crucial and this can be achieved through a life cycle assessment (LCA). Life cycle assessment is a methodological tool used to evaluate the requirements and technological impacts, processes, and products to determine their propensity on resource consumption and pollution generation. It refers to all stages of a process that includes: from cradle, that is, raw material extraction, manufacturing, and distribution in the supply chain to grave, i.e. ultimate disposal (Mckone et al., 2011). Life Cycle Assessment is used within the framework of internationally accepted methods as explained in the ISO 14040 and ISO 14044. Figure 1 is a graphical sketch of the different steps in the life cycle of biofuel from the extraction of the raw materials to the end-user.

Figure 1. Graphical Representation of LCA of biofuels
(Hauschild et al., 2017)

LCA has been used in different fields of study such as wastewater treatment (Gallego-Schmid et al., 2019), solid waste management (Sebastian et al., 2022), the development of construction materials (Liu et al., 2022), food production systems (Lamnatou et al., 2022), and the environmental impacts of processes such as cement production (Ige et al., 2021) among other sectors. These studies underscore the usefulness of LCA in decision-making process and the need for comprehensive LCA of biofuels before adoption.

There are four types of activities that constitute the Life cycle assessment. The initial step entails defining the goal and scope of the assessment. The second activity is to collect life cycle inventory data on materials and energy flows emissions as well as wastes. The third activity entails conducting a life cycle impact assessment (LCIA), which serves to characterize the constituent process impacts. Lastly is the analysis and interpretation of the major findings alongside sensitivity and measurement of uncertainty to influence the decision-making processes (Mckone et al., 2011). Figure 2 is a schematic diagram of the four activities that define a life cycle assessment process.

Dr. Ashok Rathoure (asokumr@gmail.com)

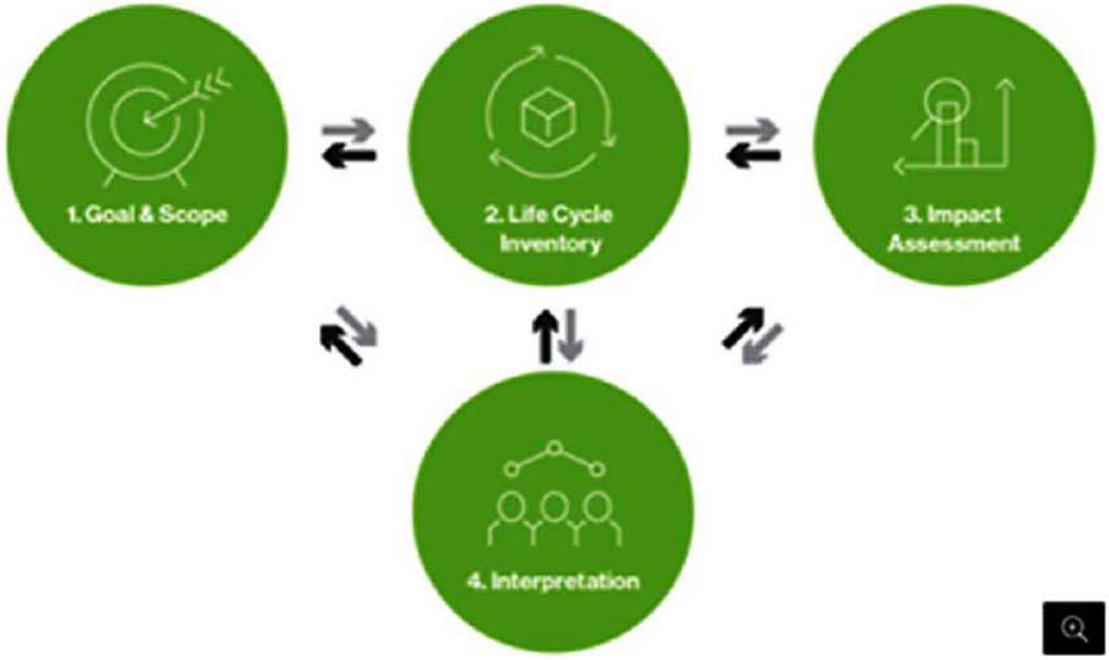
IP Address: 223.238.231.239

Figure 2. The general steps of life cycle assessment (LCA)



Regardless of the source of the biofuel used, biofuel production can be done in an environmentally friendly way depending on the raw materials used and the production technology utilized. Some important criteria for assessing fuels is their environmental impact and energy efficiency. A greater fraction of the environmental impacts of biofuel are due to the agricultural process of cultivation of the respective feedstock. The environmental impact due agricultural cultivation has been shown to be comparable to that of fuel processing (Zah and Gauch, 2007). The environmental impact attributed to the transport of biofuels is less even when the biofuels are sourced from overseas. Most research studies show that there is a tradeoff between greenhouse gas emission reduction and lowering of environmental impacts. The use of biofuels from sustainable technologies and sources can guarantee a 30% reduction of greenhouse gas emissions which is crucial for climate change mitigation (Zah and Gauch, 2007). A 30% reduction in carbon footprint is appreciable in the search for climate change resilient technologies. However, other studies have suggested that the benefits of biofuels are limited or even absent altogether (Reijnders et al., 2008). The sources of these variances are a subject of debate among researchers (Larson, 2006).

In terms of the environmental impacts of biofuels, tropical agriculture has been identified as a source of air pollution. Combustion of biomass for energy releases large amounts of CO_2, which has been linked with measurable adverse effects on biodiversity. For regions in moderate latitudes, lower yields of crops, intensive use of fertilizer and mechanical tilling of the land cause significant environmental impacts (Zah and Gauch, 2007). Using the LCA tool for environmental impact assessment of biofuels provides fresh evidence that not all biofuels have reduced environmental impacts when compared to the impacts caused by fossil fuels. From research studies, for biofuel production paths, utilization of biogenic wastes and use of grass to wood results in reduced environmental impacts when compared with petrol.

In Europe, use of biofuels has led to reduced greenhouse gas emissions and therefore improving environmental performance. Comparative studies and LCA studies on biofuels and fossil fuels have been

done and indicated reduced CO_2 emissions for biofuels. Countries like the United States, Brazil and China are the largest global producing billions of gallons of ethanol as an alternative source of renewable energy. In Europe, production of biodiesel is higher compared to production of ethanol where rapeseed is utilized as the major biofuel feedstock (Nanaki and Koroneos, 2011). European union produced about 5.7 million metric tons of biodiesel with Germany leading with production of 2890 thousand metric tons of biodiesel followed by France. Production of biodiesel is mainly done from oil crops like rapeseed and sunflower oil. Waste cooking oil and animal fats can also be used. The extracted oil is converted to biodiesel through transesterification with an alcohol. The resulting biodiesel can be blended with fossil fuel with about 5-10%. Figure 3 presents a comparison of LCA of biofuel and fossil fuel while Figure 4 shows comparative values of emissions between biofuels and fossil fuels.

Figure 3. Life Cycle of biofuels and Fossil Fuels
(Nanaki & Koroneos, 2011)

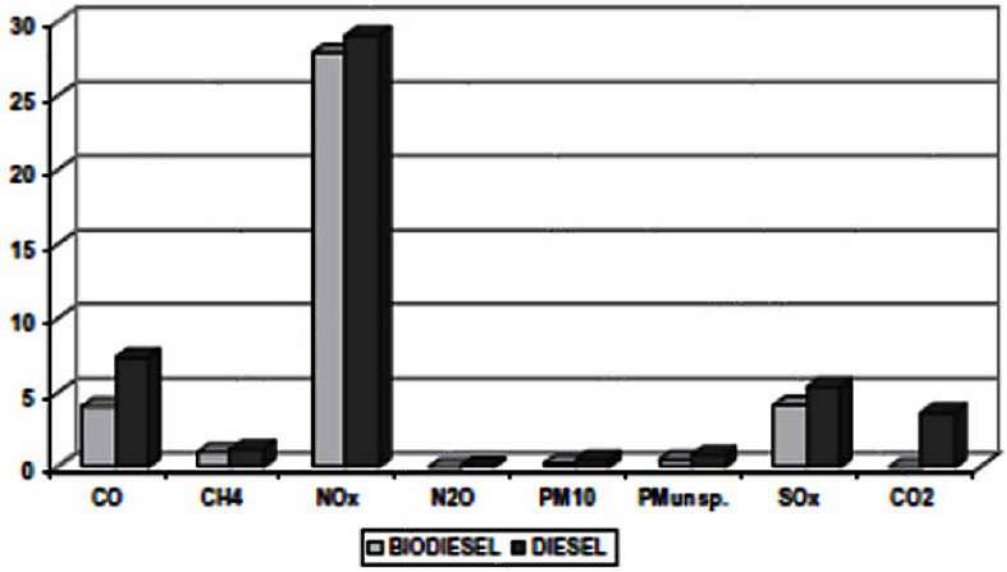
Figure 4. A comparison of emission between biodiesel and diesel
(Nanaki & Koroneos, 2011)



The use of biofuels instead of fossil energy is quite beneficial to the environment as it reduces the greenhouse gas emissions and is also a relatively cheaper option. LCA studies on environmental impacts indicate that every ton of fossil fuel contributes to about 2.8 tons of CO_2 to the atmosphere whereas, the specific carbon content from biofuels is slightly lower. For every ton of biofuel, about 2.4 tons of CO_2 is released to the atmosphere which is slightly lower than the amount released by fossil fuels. Furthermore, during cultivation of biofuel feedstock, CO_2 is assimilated (Nanaki & Koroneos, 2011).

LCA and the Future of Biofuels

Annual crops used for biofuel feedstock account for one-fourth of agricultural land utilized and indirect land use. In Sweden, only 5% of the arable land is being used for biofuel feedstock production (Zah & Gauch, 2007). To increase the production yield of biofuels, the percentage of direct land use for grassland must be increased. However, such a move will increase the biogenic greenhouse gas emissions. Even so, such an increase in biogenic emissions of greenhouse gas can be countered by ensuring efficiency through the entire biofuel production chain. For instance, in the supply chain, during the manufacture of mineral nitrogen fertilizers, oxides of nitrogen can be reduced by fitting in nitrous oxide cleaning equipment.

According to Zah & Gauch (2007), ethanol from wheat biofuel feedstock accounts for 71% climate benefit as compared to fossil fuel utilization if system expansion is applied and this excludes straw. Currently, the byproduct distillers waste is used as biofuel feedstock and it accounts for about 1-2 TWh of bioethanol. This corresponds to about 42 TWh of petrol consumption and a total of 84TWh when diesel is included (Zah & Gauch, 2007). Additionally, the existence of the export market, like in the EU, the total market for distillers' waste that is used as feedstock for biofuels corresponds to ethanol production of 5% of |Europe's petrol consumption. Using the energy allocation method, wheat-based ethanol accounts for 63% of climate benefit excluding straw.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

When distillers waste is used as protein feed in biogas production, the climate benefits from the production of biogas account for about 67% when system expansion expansions are utilized. That means digestion residues are assumed to substitute mineral fertilizers. Sugar beet-based ethanol has a climate benefit of 80% and if the energy allocation method is applied, then the climate benefit stands at 74%. In Sweden, sugarcane-based ethanol imported from Brazil accounts for 79% climate benefit and about 77% if the energy allocation method is used. To consider climate benefits and apportioning future contributions, continued expansion, the type of land used for feedstock production will be considered (Zah & Gauch, 2007).

Climate change mitigation due to the use of RME stands at 68% as compared to fossil fuels. If soy meat is substituted by rapeseed, which is a by-product, then climate benefits increase from 64% to 72%. Using the energy allocation method, excluding straw, the climate benefits stand at 53%.biomass from ley crops, sugar beets and maize promotes climate benefit of 86% for ley crops, 85% from sugar beet, and 75% climate benefit from maize biofuel feedstock.it is also worth noting that if methane losses are considered and biogas upgrades applied, then there will be a reduction of climate benefits by 5% points (Zah & Gauch, 2007).

Using manure residues results in climate benefits of 148% using waste from food industries as biofuel feedstock accounts for 119% whereas biofuel feedstock from household waste to generate biogas accounts for a climate benefit of 103% when compared to fossil fuels. The climate benefits in this case exceed 100% due to the indirect benefits gained due to recycling of the nutrients and the reduced utilization of fertilizers and recycling organic matter to the soil.

On the contrary, Hill et al. (2016) explains that the use of biofuels to reduce greenhouse gas emissions tends to encourage high consumption of fuel. Hill et al. (2016) argues that increased biofuel production will lower the fuel prices and therefore the fuel demand will rocket up encouraging additional consumption. This leads to a fuel market rebound effect which end up undermining the strategies of climate change mitigation. High biofuel consumption will lead to increased greenhouse gas emissions. Further, increased biofuel feedstock cultivation will result to indirect land use change which also contributes to increased greenhouse gas emissions.

((Hill et al., 2016)) advises that with right policies, biofuel feedstock production may help mitigate climate change issues like greenhouse gas emissions. Hill et al. (2016) further notes that the use of biofuels as an alternative low carbon source can lower greenhouse gas emissions with right policies in place, such as imposing punitive measures like increased tax on pollution activities rather than lowering fuel prices. High tax on pollution-causing activities will curb the market rebound effect. It will direct the market towards the right direction.

Benefits of LCA for Biofuels

LCA for biofuels is done to give a comprehensive comparison of the biofuels and that of fossil fuels to understand the difference in their respective environmental performance. Regulators, policymakers, and government agencies utilize the LCA tool. For instance, the Greenhouse gas calculator is developed for policymaking using a single impact category, which is global warming. LCA also gives an insight into the significant environmental impacts related to biofuels without having to compare them with fossil fuel impacts. This applies when getting data about the various feedstock's used, information gathered from LCA is also used by the biofuel companies to foster improvement and sustainability and also in research and development(Van Der Voet et al., 2010).

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

LCA helps in evaluating the environmental impacts of a given product or system. This means that it not only considers the product use of the biofuels when converting chemical energy to kinetic energy in a vehicle's engine, but also considers the industrial and agricultural processes before biofuel is delivered to the fuel tank of the vehicle (Hauschild et al., 2017). LCA helps illustrate that no biofuel is climate neutral because at the industrial process, fossil fuels are used as inputs before the biofuel usage stage. With LCA, one is able to determine that an increase in the demand of biofuels could lead to increased demand for conversion of natural land to meet the biofuel feedstock need. The conversion leads to release of carbon bound in the biomass as well as in the soil in form of Carbon dioxide. A country increasing its production of biofuels contributes indirectly to natural land loss and deforestation.

LCA utilizes a comparative assessment that uses best estimate principle. This is quite beneficial because it allows researchers to have accurate comparisons that are free of bias. This means that equal level of precaution is observed throughout the entire environmental impact assessment. Furthermore, LCA considers a wide range of environmental issues including land use, climate change, fresh water usage, toxicological impacts on human health and aquatic eutrophication. The importance of focusing on the wide range of environmental issues it to eliminate burden shifting to one type of environmental issue which has a potential of increasing other types of environmental impacts (Hauschild et al., 2017).

Moreover, due to the comprehensive LCA, one is able to understand significant effects of biofuels in socio economic status. For instance, cultivation of biofuels releases introduces fertilizer chemicals and pesticides to the soil which contribute to eutrophication as well as toxicity to the aquatic ecosystem. The biofuel feedstock cultivation will also require massive land and substantial amounts of water for irrigation, there is is loss of biodiversity and water scarcity. Additionally, increased cultivation of biofuels contributes to increased food prices (Hauschild et al., 2017).

LCA studies are used to develop policies as well as identifying the crucial areas of contribution an improvement. Recommendations from LCA studies are used in research and development areas which contribute to biofuels sustainability. Data obtained is used for contribution analysis and to trace on specific emissions, and process from an impact point of view.it identifies the key hotspots along the biofuel production chain(Somerville, 2007). According to (Nanaki & Koroneos, 2011), LCA of biofuels is a very invaluable tool that offers flexible system parameterization as well as a comprehensive integrated evaluation of the environmental impacts. The authors assert that LCA studies have the potential to impact the strategic planning and policy making of the transportation sector. This is because, it takes into considerations, aspects like technical, environmental as well as costing. LCA studies have contributed to shifting of strategic planning and in influencing operational decisions. This is because it is an effective tool in identification of improvement opportunities that may not have been captured in previous studies (Cherubini et al., 2009).

Challenges of LCA for Biofuels

Despite the advantages of LCA for biofuels, there exist challenges in the tool. Among the challenges are research gaps and uncertainty especially in areas that have not been explored or are not fully developed. Additionally, in the agricultural processes, there are uncertainties with large measurements that are not easy to obtain. For instance, biofuels use different types of feedstock that are grown in different types of soil and utilize different types of agricultural practices under different climatic conditions. These differences result in varied emission rates which cannot be generalized when determining the environment of

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

biofuels (Van Der Voet et al., 2010). Research gaps therefore emerge due to the coverage of feedstock and the respective geographical area.

Another challenge is the incomplete coverage of impacts. This is because; most of the LCA studies are limited to greenhouse gas emissions. However, recent studies have increased the scope to include other impacts, making data and models easy to use. Even so, impacts like water use and land use have barely been considered (Van Der Voet et al., 2010). Moreover, translating the functional unit into real-life improvement poses challenges of scale and dynamics. There are factors to consider when translating the pilot projects to the real world like the rebound effects, the market mechanisms that will influence food security, and the social structure.

The current supply of biofuel is feedstock from corn and sugar cane, which are farm-grown. Other sources in the future may include feedstock from farms, rangelands, or forests. Due to the nature of feedstock and their transportation cost, they may be stored and processed at small to intermediate scale facilities (Mckone et al., 2011). Compared to oil companies and government agencies that have a hierarchical structure to make decisions, biomass production has no such hierarchy and decision making especially at the first stage of production. When implementing a life cycle assessment of biofuels to influence policies proves to be a hard task as compared the case of a formal hierarchical structure. For example, uncertain weather conditions, complex markets pricing, and tax policies influence farmers in unpredictable ways.

Additionally, due to the vast sources of feed stocks ranging from sugar cane, cane residue, rapeseed, switch grass, and other oilseeds, a wide range of information is needed because the characteristics of the feedstock are different. Therefore, it is difficult to make an overarching decision with different characteristics. This is because many alternative feed stocks will have mixed output systems. For instance, one type of crop can produce protein and at the same time produce fuel feedstock (Somerville et al., 2010).

Furthermore, it is crucial to apportion impacts biofuel feedstock from primary products, by-products co-products as well as residues. Allocation of decisions requires a clear rational basis. Mckone et al. (2011), assert that impact metrics like carbon, health, water footprint require a clear and rational basis. Biofuels feed stocks with mixed outputs are sensitive to either of the allocations like no allocation, allocation by energy, or allocation by economic approach. There is a challenge on the sensitivity of impacts to the choice of allocation (Gnansounou et al., 2009; Guinée et al., 2009). The U.S EPA's renewable fuel standard assessment has had such a challenge. For instance, when determining if rapeseed biodiesel fuels meet the EU renewable energy directive that saves on 60% of greenhouse gas emissions, researchers found out that it meets the requirements. However, only the rape cake, which is a co-product, was used along with the use of glycerol as a source of heat. Allocation by energy content was used (Thamsiriroj and Murphy, 2010). Several other studies depict this problem in the choice of the allocation method (Kendall et al., 2009; Slade et al., 2009).

Moreover, farmers and foresters are a bit reluctant in making long terms land and resource commitment to perennial feed stocks like tree crops and switch grass. Despite the land being suitable for such feed stocks, the farmers need assurance of clear markets as well as financial security. An additional issue is the indirect land use (Fargione et al., 2008). Land available for both food and biofuel feedstock is already heavily used. Biomass production will accelerate deforestation. Deforestation leads to the release of large amounts of carbon to the atmosphere causing a climate impact debt that will take decades to counter. Furthermore, the use of cropland for biofuel production has also been linked with increased emission of greenhouse gases (Searchinger et al., 2008).

CONCLUSION

Biofuels are promising alternative energy sources to fossil fuels with appeciable grenhouse gas (GHG) benefits. The increase in biofuel life-cycle assessment (LCA) studies has subtantially bridged the gap in the discrepancies reported by different researchers on the sustainability of biofuels. While the benefits of biofuels are appreciated, LCA studies also show that conversion of forest land to fuel crops has no greenhouse benefits and may even increase GHG emissions. Future research should emphasize land use, land use change and water in LCA. With paucity of data on such important parameters, discrepancies still remain which limit policy making.

Chapter 3
Entrepreneurial Opportunities In Bioenergy

Prashant Kumar
https://orcid.org/0000-0001-9760-6903
Department of Bioinformatics, Kalinga University, Raipur, India

Sunil Kumar Verma
B.N. College of Engineering and Technology, Lucknow, India

ABSTRACT

Entrepreneurism is vital as entrepreneurs push technological change and innovation, consequently generating economic growth. Bio-energy entrepreneurism is the focal point of this chapter, along with entrepreneurial motivations, opportunities, and market drivers. Market drivers include government policies, trends in energy use, and progression of the energy sector into more renewables. Several factors influence entrepreneurs, which involves several factors ranging from the environment to economics, pioneering spirit, and social factors. With the help of entrepreneurial motivations and market drivers, individuals can easily visualize and plan all the bio-energy sector opportunities. Bio-energy entrepreneurs moderate the market of transformation of biomass to energy. The bio-energy field is filled with stories of failures, successes, and everything in between. There is a marginal difference between a failure story and a success story in the modern bio-energy sector, which narrow down to timing.

1. INTRODUCTION

According to an assessment by the International Energy Agency, by 2026, India is on track to become 3rd world's largest market for ethanol behind Brazil and the United States of America, having increased ethanol requirement to an anticipated three billion litres amid 2017-2021. According to the agency, by 2026, Asia is expected on the way to surpass Europe in provisions of bio-fuels output, thanks to India's expanding appetite. While by 2026, yearly global demand for biofuels is expected to increase to 186 billion litres, an increase of 28%, Asia is expected to contribute over thirty per cent of new output during the predicted era. The main driver of demand expansion is thought to be government policy. Additional

issues such as public transportation fuel demand, expenses, and policy design will also significantly impact. In June, Prime Minister Narendra Modi stated the government is committed to achieving a 20 per cent ethanol blend in gasoline target by 2025. Previously, the deadline had been set for 2030. According to CRISIL analysts, roughly 16-18 million tonnes of gasoline transactions are expected to be replaced due to ethanol mixing. It will be difficult for India to meet its 20 per cent blending goal in just five years, But even attaining 11 per cent blending would make it the world's third-largest ethanol market behind the United States and Brazil, the IEA study concluded, making it the world's third-largest ethanol market behind the United States and Brazil (Street, 2012). A considerable portion of India's current vehicles could be incompatible with fuel blends containing more than 10% ethanol. Retrofits are an option However, given the scale of the undertaking, this may be impractical, the IEA stated, adding that flex-fuel vehicles or vehicles otherwise compatible with 20% blends will need to be made accessible. Consumers will need to be persuaded to buy them. (Street, 2012) At present, the percentage of ethanol in gasoline is roughly 8.5 per cent. Under the Ethanol Blended Petrol (EBP) programme, the government has already reintroduced the administered price mechanism for ethanol procurement, allowing ethanol production from a variety of feedstocks such as heavy molasses, sugarcane juice, sugar, sugar syrup, damaged food grains, maise, and surplus rice stocks with the Food Corporation of India (FCI).

In Ethanol Allocation Year 2016-17 (December 2016 – November 2017), government governed oil marketing companies obtained 66.5 crore litres of ethanol, which grew to 173 crore litres in the Allocation Year 2019-20. As previously stated, the government authorised oil CPSEs to build 2nd Generation (2G) Ethanol Biorefineries using agri-residues and biomass in various parts of the country. OMCs are building 12 2-G biorefineries for a total asset of Rs 14000 crore. Ethanol purchased through the EBP programme is subject to a 5% GST rate. The EBP initiative attempts to alleviate environmental problems, lower oil imports bills, and provide farmers with a remunerative income. For Ethanol Supply Year 2O2O-21, the procurement price of ethanol was Rs 62.65 per litre for sugarcane juice, Rs 51.55 per litre for spoiled food grains, Rs 56.87 per litre for rice available with Food Corporation of India, Rs 51.55 per litre for maise, and Rs 45.69-57.61 per litre for heavy molasses. After acquiring statutory permits, sugar mills and distilleries are allowed to build ethanol facilities, and the government announced an interest endowment scheme to aid in the construction of these plants. (*International Energy Outlook 2013*, 2013)

2. ENTREPRENEURSHIP MOTIVATIONS

The primary movers or significant stakeholders in all bioenergy entrepreneurial ventures may be motivated by various factors. Lin (2008) acknowledged three key expansion motives for entrepreneurs: social welfare, environmental and entrepreneurial. Bioenergy will solve a problem or issue with the environment in a project with environmental implications. The environmental incentive can be seen in swine farms whose expansion plans are thwarted by concerns about the increased stench. An anaerobic digester that produces biogas eliminates stink dilemma whilst producing energy, used to generate electricity and operate agricultural equipment in the farm (biogas is cleaned to eliminate contaminations, subsequently compressed and consumed as compressed natural gas). (*Cultivating Entrepreneurship | University of Maryland Extension*, n.d.) There are several definitions and examples of social welfare, including delivering energy to a community at a cheap rate than traditional generating, creating employment for the community, and raising tax revenue. When public leaders sought to fund, manufacture, or recruit ethanol factories to their area, the corn ethanol boom provided multiple cases in point of social welfare

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

motives. After it was put together, the ethanol factory delivered high-wage jobs, generated significant tax revenue, and raised maise costs.

In conclusion, prime movers display entrepreneurial instincts when they take chances with breakthrough technologies without a market. The aim to be a market leader in a new bioenergy area drives these entrepreneurs. This kind of entrepreneurial motivation may be perceived in the 1st generation cellulosic plants, which are still trying to get up and running. A further case of entrepreneurial motivation is the several minor businesses running with algae to develop a way for producing and harvesting algae for biofuels. (Han, n.d.)

Ahead of Lin's goals, Shane explained that entrepreneurship requires a human group and an innovative route in which enterprisers participate in the creative activity by relocating resources in a novel way. (Shane et al., 2003). It might be characterised as the fourth motivator of pioneering spirit, or, as Shane puts it, human motivation plays a critical role in the entrepreneurial process. This pioneering mindset will benefit bioenergy entrepreneurs to compete with fossil fuels by bringing alternative energy sources to market. An entrepreneur must be driven by a desire to respond to market conditions. The next part delves deeper into these market drivers.

3. BIOENERGY AS A BUSINESS

The acceptance and development of a dependable source of renewable bioenergy is a big challenge that most countries face. The majority of studies in renewable energy focus on the controlled models of implementation intended for this type of energy. (Järvinen, 2005) From a business standpoint, the economic benefit of bioenergy is strongly reliant on bio-mass robust usage. As a result, a grasp of bio-energy utility parameters is critical. The source of bio-mass, the structure and location of the active business, the storage and transformation centre, and the relevant supply and consumption sources are all key aspects to consider when assessing the advantages of bioenergy in a business setting.

The improvement of high-efficiency bio-mass heating systems has unlocked up fresh possibilities for the active use of wood in wooded areas with systems located close to the user. In general, the plant placement is adjusted by locating the optimum site within high-productivity wooded areas with a handy network of forest paths, a good presence of a woody business, and easy grid connectivity. The environmental impact, economic and social implications, and Encouragement of communal amenities all play a role in the economic viability of bio-energy power plants. As a result, bio-mass heating has numeral convincing benefits, both for the surrounding community and system proprietor in the case of district heating systems. (Dahiya, 2014)

Bio-energy may generally replace expensive traditional energy sources and electricity with local biomass resources, typically accessible for little or no cost as waste (*Cultivating Entrepreneurship | University of Maryland Extension*, n.d.). Bioenergy can reduce pollution and greenhouse gas emissions while simultaneously protecting customers from rising fossil fuel prices. Bioenergy production creates multiple local jobs in the feedstock assembly, planning, and transportation. It allows several other firms to expand and reduces transportation distances. (*International - US Energy Information Administration (EIA)*, n.d.)

The bioenergy industry has several difficulties. Currently, biomass heating systems are more expensive to install than traditional fossil fuel-burning systems. If their cost does not fall, the development of bio-energy usage may be slowed. It should also be noted that the quality of biomass feedstock is vastly

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

varied compared to the more standardised commercially available fossil fuels. (Käkölä, 2003) Bioenergy production necessitates increased physical space for biomaterial supply, storage, and handling. When bioenergy production presents more logistical obstacles, it naturally necessitates greater operator engagement and diligence, which costs more money.

Where the cost of conventional energy is high, and biomass feedstock is low, biomass-heating systems appear to offer the best commercial opportunities (Ojala, 2008). If numerous bio-energy systems are linked regionally, the benefits of bio-energy can be amplified. There are no technological barriers to merging bio-mass heating, wind and solar power, and water power into a similar energy network. Societies with various energy suppliers on a single network are less vulnerable to fluctuating energy prices and climate change.

Nevertheless, the bioenergy industry's ending advantage is always quantified in the bioenergy sector, including customers, merchants, and manufacturers. As a result, it is critical to comprehend how the bioenergy business and marketplaces operate and how distinct players appear to benefit from them. When a product is needed but is inexpensive and functions well, the customer receives a value. (Järvinen, 2005; Käkölä, 2003; Ojala, 2008)

Customer value = performance / price

The above formula is founded with the premise that each product module or role has its unique expenditure, which drives up the cost of the product. In actuality, the expense of construction these functions vary by customer, as do the needs of particular consumers. As a result, each product function should meet consumer demand as outlined in the formula below. (*November & December 2008 Newsletter | Agricultural Marketing Resource Center*, n.d.; Reinis et al., 1975)

Value = Value = [(n · a/c) 1+(n. a/c)2 + (n · a/c) ?]

where:

n = the need for an object or service
a = the ability of an object or service to satisfy this need
c = the cost of the object.

The functions that should meet the customer's needs are represented by numbers in this formula, with the final function represented by a question mark.

A retailer's value of a bioenergy product may fluctuate significantly from a customer's value. This is because, for starters, the retailer is primarily concerned with the monetary gain on his investments. Retailers are looking for fast returns and products that can be sold rapidly. Furthermore, retailers aim to make the most money with the least money. As a result, the value formula for a retailer is not the same as the value formula for a customer. In its place, computing a cost-to-benefit ratio, merchants approximate the sales revenues they assume to gain by selling their products, as shown by a retailer's value formula. The formula computes the retail product value (Jordão, 2011).

Retail value = unit sales (unit price – unit cost)

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Maker utilises his formula to calculate the worth of bioenergy products for a retailer or a client. This is because his interests differ slightly from those of the others. He has higher capital costs than a retailer because of the production plant and tools, which tend to compel manufacturers to retain working most of the time. Because the manufacturer is likewise concerned with the gain on his investment, he uses the following formula to determine manufacturing value. (Shane & Venkataraman, 2000)

Manufacturing value = [Customer and retailer benefits (1 to n)] + Profit/Costs

Bioenergy generation should be addressed financially in addition to the business value consideration.

In practice, this implies that all investments should pay off in the long run, and entrepreneurs and communities should also benefit from their efforts' commercial benefits and profits. As a result, the cost of invested capital might be a hurdle for the bioenergy industry. This is since, to thrive, a bioenergy firm may require public investment at first, as private funding may not be accessible. Even if this is the case, bio-energy entrepreneurs must ensure that their business strategies are appropriately constructed, taking into account a variety of business metrics such as value, profitability, and funding. With a well-crafted business strategy, an entrepreneur can also communicate his objectives to various bio-energy industry participants. (Shane & Venkataraman, 2000)

4. BIOENERGY OPPORTUNITIES: BIOFUEL VALUE CHAIN

Waste streams such as municipal solid waste or manure, plant oils, dedicated energy crops, agricultural crop leftovers, and waste streams such as municipal solid waste or manure are all examples of bio feedstocks. (pre-consumer or post-consumer). Production, harvest, storage, and transportation costs apply to each feedstock. Examining the stages involved in producing feedstock's will provide business prospects.

The following is a breakdown of the biofuel value chain:

Breeding and genetics of feedstock's/Feedstock production/Logistics of feedstock's/Biomass processing/Conversion processes/By-product and co-product utilisation/Marketing distribution Innovative people and small businesses can make critical discoveries in the areas of biomass crop genetics and conversion biotechnology, which are both areas where innovative people and small businesses are capable of creating significant findings linked to better ways to convert biomass to fuels. Biotechnology can impact biofuels production through enzymes, catalysts, yeasts, and plant breeding. Engineering linked to equipment development and refinement is required to solve and improve the system, both at the bio-refinery and across the supply chain. Engineers and tinkerers have come up with new ways to solve equipment difficulties. These solutions have the potential to be commercialised. (Street, 2012)

Fuel has always been distributed through leading corporations and gasoline and diesel organisation. Bio-fuel companies are increasingly participating in the supply chain by growing into blenders and promoting customised pumps that provide consumers with bio-fuel options.

By-products and co-products are critical to first-generation ethanol facilities' profitability. Similarly, enhanced bioenergy facility economics will result from the capacity to market by-products and co-products. Distiller corn gluten and grains feeds are two of the essential co-products of the corn ethanol business. The maise ethanol industry also sells CO_2 and post-fermentation corn oil as by-products. A separate firm partner is frequently used to capture and market the by-product. Companies have formed in some circumstances to add value to the by-product, such as pelleting distiller's grains for sale as a denser

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

feed, capturing CO_2 for use in the bottling business, and converting maise oil to bio-diesel. Regarding the potential for entrepreneurs to put value to a low-value product, by-products are worth investigating.

5. OPPORTUNITIES IN SMALL-SCALE BIOENERGY

Entrepreneurs who make their bio-diesel conversion systems, capture CH_4 from manure and other waste or use waste wood and other materials for heat generation have a long history in small-scale and niche industries.

5.1 Biodiesel

Biodiesel is a clean-burning, environmentally friendly fuel made from edible and non-edible oils trans-esterification. Compared to traditional fuel sources, it is renewable, cost-effective, carbon-neutral, and non-toxic. As a result, it is widely used to minimise carbon emissions in India's automotive, marine, and railway industries. Biodiesel is also mixed with petroleum diesel fuel in compression ignition engines because it improves engine lubrication and extends engine life. In India's vehicle sector, rising petroleum products and growing environmental concerns drive up demand for biodiesel.

Furthermore, the market's expansion is aided by a growing focus on sustainable development techniques. Biodiesel is also utilised to power underground mining equipment and machinery because it improves air quality, increases energy security, and provides various safety benefits. Aside from that, increased energy consumption and the growing use of biodiesel as a heating fuel in both home and commercial boilers are expected to impact the industry in the coming years positively.

5.2 Methane

This segment only analyses biogas methane produced by anaerobic digestion; added bio-gas CH_4 sources, as landfill gas not included. When high carbon materials are enclosed in an anaerobic environment, microbes digest the organic components and release bio-gas, biogas methane is produced (predominately methane). Manure, food industry wastes, human sewage, and other organic waste are all common feedstocks for biogas methane generation. Methane can generate energy in internal combustion engines. Manure is an excellent feedstock for a CH_4 digester, and it is also a feedstock for an anaerobic digester. As a result, such systems are commonly found on swine operations, dairy farms and municipal wastewater systems. The systems produce methane continually after they are deployed. Methane needs to be used or released to avert pressure from developing in the system.

- Flaring CH_4 can help the environment since it converts one carbon and one methane molecule into CO_2, which has a Twenty-four times lower greenhouse gas effect than CH_4.
- If there is a cost for reducing CO_2 equivalents greenhouse gases, such as renewable energy credits or carbon trading.
- Odors can be reduced with the help of Anaerobic digestion, and it has been effectively utilised to lessen odours at a processing facility and farms, letting the facility continue in crowded locations or grow with less opposition from fellow citizens.
- farmers can become bioenergy entrepreneurs. Instead of being the primary product.

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

5.3 Biomass and Wood

Residential wood heating has been a staple of human civilisation for millennia. In the US nowadays, heating with the help of wood-burning in homes is widespread in densely forested areas. In certain circumstances, technology has remained relatively unchanged. Individual homeowners cut and process their wood in most situations, although some acquire wood from small businesses or other individuals. (Verma & Hussain, n.d.) Pellet stoves, which burn wood or other biomass pellets and have extra controls than wood stoves, have become more popular. For mass transport and packing, wood pellets are homogeneous, dense, and flow freely. Wood pellets have grown in popularity in Europe due to their renewable nature and lower greenhouse gas emissions than coal or other fossil fuels. Pellets for commercial and other heating applications have developed markets. (*International Energy Outlook 2013*, 2013)

- Wood harvest
- Other than commercial timber harvest, thinning, slash, trimmings, lumber mill trash, manufacturing waste, shelterbelt renovation, old pallets, and dead tree clearance are all wood sources.
- Wood processing is converting wood into wood pellets or other high-value products.
- In recent years, the international market for wood pellets has exploded.

5.5 Cooperatives

Cooperatives consist of working collectively to address their members' mutual needs. The cooperative's ownership and governance are shared by its members. Bio-energy cooperatives have sprung up to provide bio-energy to associates or utilise feedstock provided by members. Many businesses begin as cooperatives to benefit from shared resources. A few are created as a project that is way too big for a single individual or family to handle alone. Creating a cooperative can assist in overcoming the first scale. Others are created to deliver a higher-quality product or service than an individual could provide on their alone. The structure will vary based on the cooperative's goals. However, in general, a group of like-minded people pool their capital, labour, or other resources to develop a business that benefits all members. (Ojala, 2008) A cooperative's goal could be social welfare, environmental, or entrepreneurial to return to the developmental objectives.

- Examples of bio-energy cooperatives
- Biodiesel on a small scale (oilseeds are given, bio-diesel is the end product, and members use it for environmental reasons)
- Bio-mass pellet mill
- Methane digester

6. LARGE SCALE BIO-ENERGY OPPORTUNITIES

Large scale bio-energy signifies to businesses that can process tens of millions of gallons of water/year or else millions of tonnes of biomass. Two instances are multi-million gallon per year bio-refinery or megawatt-scale biomass to heat and power facility. These amenities necessitate a substantial financial investment. Entrepreneurship can occur at this magnitude, yet we often associate entrepreneurs with

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

small start-up businesses. We have looked at small businesses how they contribute to large and small scale bio-energy for the objectives of this chapter. Bio-energy entrepreneurs analyse the supply chain at all scales and how challenges might be resolved in creative and novel ways. For specialist expertise and equipment, bioenergy facilities continually depend on technology vendors. Heavy machinery, computers, analytical equipment, waste management and chemistry are just a few of the areas covered by these technological companies. (*Ethanol Impacts | Agricultural Economics*, n.d.)

6.1 Opportunities at the Periphery

There are other options outside of the bio-fuel or bio-energy trades. As a method to contribute, entrepreneurs may be at ease to work on the outside. These off-the-beaten-path options may not immediately benefit the bio-fuel and bio-energy industries, but they do take advantage of their presence. This peripheral activity includes businesses that pop up to satisfy the individual requirements of construction employees throughout peak construction periods. (Ojala, 2008)Following the development boom, these enterprises rely on community patronage as well. Such businesses gain an advantage by having a solid first year of operations, which allows them to pay off debt sooner.

As part of bio-energy booms, various peripheral establishments started, which includes the following:

- Motels
- Cafeterias
- Apparel stores
- Bank
- Service station
- Studio apartment

7. GOVERNMENT INITIATIVE IN SECTOR OF BIOENERGY

7.1 National Bio-gas Fertilizer Management Program

Construction of family size biogas plants of 2 to 6 cu. m. efficiency is being made by Uttar Pradesh New and Renewable Energy Agency from the additional financial year 2010-11 of Rural Development Department and KVIC as per the design and drawing approved by the Ministry under this scheme, such as Dinbndhu, KVIC or installation of permissible prefabricated biogas plants, domestic fuel supply, lighting, and for the production of organic fertiliser for construction of family-size biogas plants of 2 to 6 cu. m. efficiency is being made. The rest of the cost is borne by the beneficiary as part of the Central funds of Rs. 9000/- for General Category beneficiaries and Rs. 11000/- for Scheduled Caste beneficiaries. The cost of a two cubic metre biogas plant is around Rs. 22,000/- per plant, and the plant can cook food for five people simultaneously by providing light for 4 to 5 hours per day from 1 lamp. The plant will also produce 6 tonnes of high-quality organic fertiliser per year, and the plant will provide the equivalent energy of around 18 LPG cylinders per year.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

7.2 Biogas Based Power Generation Program

In this system, a generator's gas produced from a biogas plant is used to power plants with capacities ranging from 3 to 250 kV, per a ministry-approved design and drawing. After the beneficiary completes the construction plant, the Ministry will reimburse the beneficiary with a reward ranging from Rs 30000-40000/ kV in declining order. A biogas plant with a capacity of 85 cu. m. may be built with 155 cattles. A hundred units of electricity/day and approximate 270 tonnes of high-quality organic fertiliser are generated by a 100 per cent bio-gas-powered generator with a 10 kV capacity that costs around Rs. 16 Lacks.

7.3 Bagasse Based Co-Generation Project's in Sugar Mills

There is a lot of bagasse accessible in the state's sugar mill, which has much potential for co-generation. Uttar Pradesh New and Renewable Energy Agency began its endeavours in 1994 as an architect to establish power production plants based on co-generation using bagasse from Uttar Pradesh's sugar mills.

Throughout 1994, the state government created a strategy to encourage the development of similar enterprises in the state. PPAs agreed with the power corporation were later specified as model PPAs after founding the U. P. Electricity Regulatory Commission.

7.4 Biomass-based Power Projects

There are numerous options to build power plants of various capacities using biomass other than bagasse and a range of processes (gasification, co-generation, and combustion). According to a TERI report, the state has a biomass power generation capacity of 3757 megawatts. To establish such initiatives, region-specific surveys must be conducted to estimate the projects' true potential. The following is an updated list of other biomass-based initiatives in the state besides bagasse.

7.5 Biomass-Based Gasifier Power Project

Gasifier Plants (from 40 kilowatts to 1 megawatt) based on gasification process employing primarily rice husk biomass may meet the electrical and thermal energy requirements. Entrepreneurs are putting up gasifier plants with or without grants from the union government to seek aid from rising costs and shortage of oil and electricity. By the end of 2013-14, more than 171 industrial units in the state had established gasifier plants, resulting in a total capacity of 40-44 megawatts.

7.6 Biomass-Based Co-Generation Power Project

MW-scale co-generation power plants based on combustion processes using agro-residues have been built in several sectors. These projects are put up in pulp and paper mills that demand thermal (process steam) and electrical energy. They can meet those industries' thermal and electrical energy needs. The establishment of non-bagasse-based co-generation power projects is being supported in the state's various paper mills. Until the end of 2013-14, a total of 201 megawatts of capacity had been built. (*R&D | Ministry of New and Renewable Energy, Government of India*, n.d.)

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

7.7 Industrial Waste Based Power Projects

The processing of waste disposal from various industrial units, including distilleries, food processing companies, dairies, pulp and paper mills, can generate more than 150 MW of energy for the state.

108 MW of capacity was generated from waste by various industrial units (mostly distilleries) until the 2013-14 fiscal year. (*R&D | Ministry of New and Renewable Energy, Government of India*, n.d.)

8. EXAMPLES OF INDIAN ENTREPRENEURISM

8.1 Bio-solutions India

The Hamburg-based company purchases agricultural waste through farmers and manufactures biodegradable packaging and tableware in Ramanagara, near Bengaluru. The patented process turns it into self-binding fibres by simply churning agro-waste with water in massive machinery. The result is biodegradable packaging and dinnerware that only takes three months to decompose. This addresses two environmental issues: crop waste disposal and plastic pollution while also giving farmers a new source of revenue. BIO-SOLUTIONS tested their packaging with Big Basket, an online grocery store, from early 2017 to mid-2018, by providing limited quantities of packaging for fruits and vegetables. (Roopa, n.d.)

8.2 Kriya Labs

It offers a way to convert fifteen to twenty million tonnes of agricultural stubble every year, primarily rice straw, which has no market matched to different types of agro-waste such as wheat straw and bagasse. They use their method to turn rice straw into pulp. Paper (and its derivatives), bioethanol (biofuels in general), textiles, and other speciality chemicals such as cellulose acetate and carboxymethyl cellulose can benefit from this pulp. The procedure is safe for the environment. Pulp quality is determined by the eventual use and can be adjusted accordingly.

8.3 Farm2Energy

Sukhbir Singh Dhaliwal's start-up in Punjab assists farmers by baling the stubble from their fields for free. The company, founded in July 2016, provides bio-mass supply solutions to various clients, including farmers, landowners, and bio-mass users. The company uses integrated supply systems to treat paddy straw, maise stover, sugar cane garbage, and wheat straw before supplying it to the bio-fuels, bio-power, and biobased industries. It also aids farmers in the management and utilisation of biomass. Biopellets, bio-char, and torrefied pallets are also available through Farm2Energy. Biopellets (produced from a mixture of paddy straw and sugarcane trash) are a sustainable alternative to traditional fossil fuels used in various commercial and industrial applications. Biochar increases soil productivity, resulting in increased output. The third product, torrefied pellets made from torrefied biomass, can be used as a coal alternative. Torrefaction can be defined as a thermal breakdown that occurs at 200 to 320 degrees Celsius without oxygen. This increases the density of the biomass and enhances the burn quality. (Roopa, n.d.)

The Delhi-based company collects oil from FBOs (food business operators) and converts it into biodiesel. It also provides a wide range of environmental services, including mixed biodiesel supply,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

industrial tank cleaning, agricultural and blood waste recycling, and a biogas anaerobic digestion facility, among other things. (*This Woman Entrepreneur's Start-up Collects Used Cooking Oil to Convert into Biodiesel*, 2021)

9. CONCLUSION

Biomass-based energy is still not cost-competitive with conventional energy in many situations, which is a significant barrier for bio-energy entrepreneurs that hope to offer energy in straight rivalry against fossil fuels. Several revolutions arise when the fossil-fuel business is under pressure from environmental regulations. One of the main reasons for the elevated prices of renewable fuels and energy is the high cost of feedstocks. Trees are one instance of a minimal cost bio-mass feedstock. Even if the plants are free (as in government wildfire thinning), the expense of chipping, harvesting, and shipping in January 2014 was 2 to 4 times that of Wyoming coal per million Btu. (Han, 2007). With increased competition, the primary picture of expensive feedstocks is expected to remain. Biofuels markets are still developing and unstable, which will make it difficult for businesses to obtain financial financing and a steady market for their products. Government consents for bio-fuels exist, but new proposals for revisions and repeals emerge each year, creating uncertainty for investors. The bioenergy industry's immaturity and unpredictability significantly differ, not the primary concern. For bioenergy entrepreneurs, the characteristics of a self-starter, devoted, risk-taker, unlimited energy come into play (Xiang, 2014). These characteristics are essential for the next phase of bio-energy development to succeed. An entrepreneur needs the foresight to see what lies in the future, the courage to take risks in an ambiguous environment, and the drive to keep moving forward.

ABSTRACT

Energy is one of the most precious and demanded commodities among various industries and consumers to sustain the current lifestyle. Energy is a crucial element, which unswervingly influences the country's economic development. Numerous methods are adopted to reduce global warming, embracing clean energy from wind, solar, and biomass sources. This chapter speaks about the current situation of energy demand, the innovations in biofuel sources, and the obstacles regarding the commercialization and production of microalgal biofuel.

1. INTRODUCTION

1.1. Green Energy Projection and Foundation of Energy Demand

The term 'energy' is supposed to be a derivative of the Greek word '*Energeia*' which means activity, and as we advanced, the explanation of energy transformed according to its field. When coming to the biological system, cells store energy in biomolecules such as lipids, complex carbohydrates, and proteins. The first law of thermodynamics can conclude that energy can neither be created nor destroyed; it can only be transformed from one form to another (Figure 1).

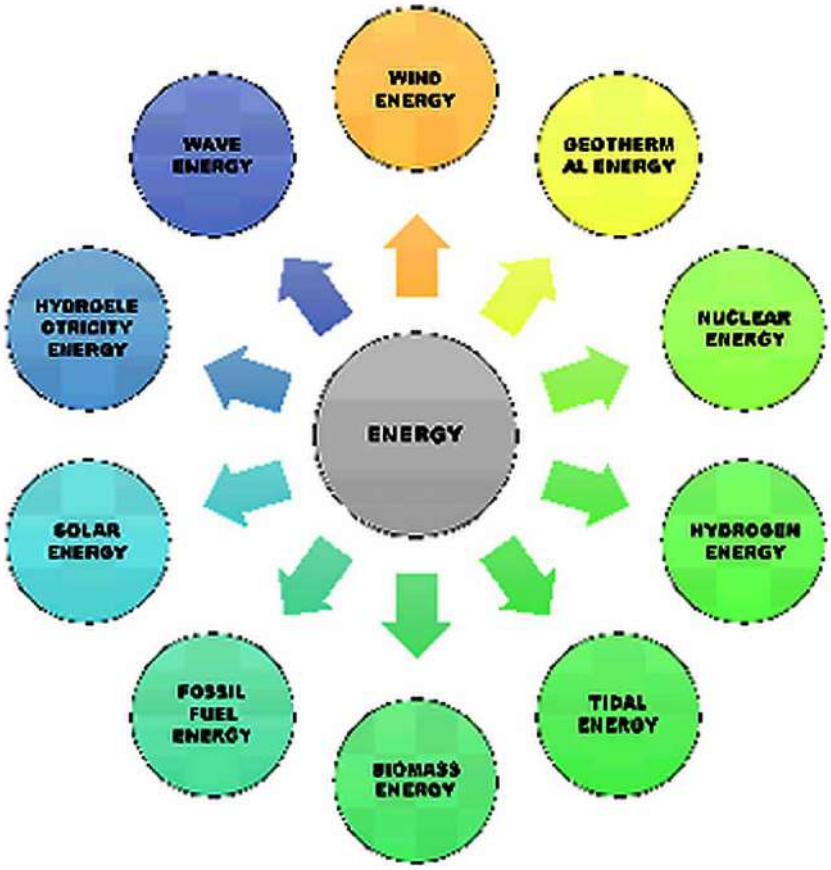
Figure 1. Various types of Energy



Worldwide to sustain the current lifestyle, energy is one of the most precious and demanded commodities among various industries and consumers. Energy is a crucial element, which unswervingly influences the country's economic development (Cleveland et al.,2000). It can be comprehended to the advanced energy accessibility the improved chances of nations growth. There is a solid and direct correlation between energy to per capita GNP, countries with the higher gross national product have higher energy consumption per individual (Stern, 2011). The exponential boom of energy use was originated through fossil hydrocarbon burning, with the additional support of coal in the 19thcentury, followed by Crude oil use in the 20thcentury, and currently, prolonged with the help of natural gas (Hall, 2016; IEA, 2016; Sayre, 2010). Currently, fossil fuels' central portion of energy demands is fulfilled. Worldwide, there is an increase in fuel price due to decrease in fossil fuel reserves (Monari et al., 2016), in addition with increased greenhouse gas emissions leading to global warming are two major concerning coercions for the transport area (Reyimu and Özçimen, 2017; Hashim et al., 2017; Lecksiwilai et al., 2017). Combustion of fossil fuel is required for power generation despite having several negative consequences such as pollution (Liu et al., 2017). Several pollutants such as SO2, NOx, CO, CO2, ground-level ozone, particulate matter, volatile organic compounds (VOC) are emitted.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

There has been an increase in global temperature by 2 ºC due increase in CO2 emission in the last decade (Friedling stein et al., 2014). In 2015, the Paris agreement was signed by around 194 countries whose primary aims are

1. Reduction of 2 ºC in global temperature.
2. Aim to curb greenhouse gas emissions.
3. Reconnoitre substitute energy sources.

It is a well-known fact that there is a decrease in global fossil fuel reserves, and its current usage rate will last a few generations. We have to reduce our energy demands in the coming future. We need to search for eco-friendly, renewable fuel prospects (Dresselhaus and Thomas,2001). Biofuel produced from biological materials can be used as a substitute for diesel due to low emission levels when matched (Tsolcha et al., 2017; Bildirici, 2017). Major significance of using bio-fuel is that It is made from renewable organic substances and has the capacity to eliminate several of the negative features of fossil fuel extraction and usage, such as greenhouse gas and conventional pollutant emissions, finite resource depletion, and reliance on volatile, unpredictable foreign suppliers. The demand for bio-fuels also gave boost farm revenues (united states environmental protection agency, 2022). Nevertheless, sustainable biofuel promotion in the energy sector relies on several elements: government course of action. Currently, each country needs to frame its policies to have better biofuel penetration in the energy market. (Su et al., 2015) policies may have regulatory gaps which provide a political system to countersign contradictory objectives. With the introduction of bio-fuel in the energy market, by 2010 around 3% of worldwide transportation energy used was in form of bio-fuel and with the current increase it is expected to reach 27% of transportation fuel by year 2050 (Timilsina, 2014). The biofuel importance was first accredited by Brazil, the United States of America, and the European Union; now, this importance is being understood by Asian countries which can be understood by the amount of bio-fuel produced by them as mentioned in table 1 (Mohan et al., 2006).

Table 1. Biofuel Production

Country	Ethanol	Bio-diesel	Total	Reference
Brazil	19 000	227	19 227	(FAO, 2008)
Canada	1 000	97	1 097	
China	1 840	114	1 954

Brazils bio-fuel program was a massive success due to strong support of stringent legal directives and operative enactment (Mohan et al., 2006). In consideration of India's perspective, in 2008, A National

Policy on Bio-fuel was approved to standardise biofuel marketing in India via various firms in a transparent and operative mode following all accepted legal guidelines. However, we cannot replicate Brazil's success in India because of different climates and inconsistent rainy season patterns. Since then, in the last fifteen years, the Indian government has implemented different policies to encourage the usage of biofuels. In order to accomplish all the policy objectives, we need to have competent policy strategies to have appropriate information of the market and its dynamics for the day to day scenario (Barisa et al., 2015).

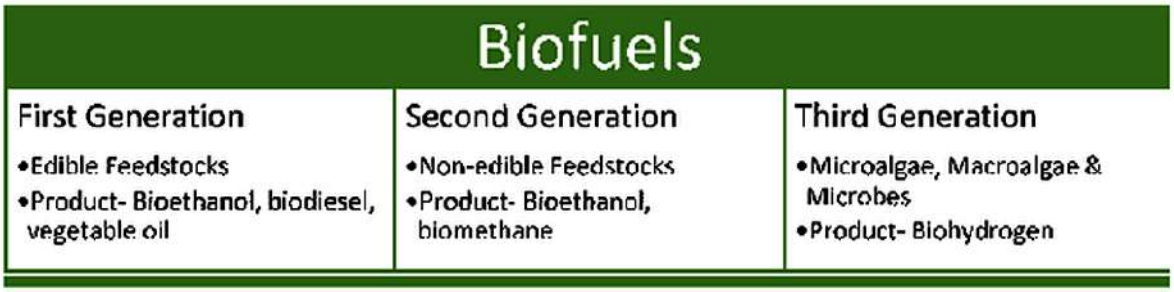
2. BIO-FUEL EVOLUTION AND ITS HOLDUPS

Bio-fuel is a non-hazardous fuel derivative of numerous biomass feedstock, and environmentally hazardous fossil fuel can be substituted (Voloshin et al., 2016). Biodiesel, bioethanol, methane and hydrogen are several biofuels produced by several countries using different types of biomass. Biofuels have turn-out to be crucial sustainable sources for restraining the production of Greenhouse gaseous (Huang et al., 2012).

Crucial benefits of bio-fuels above traditional fossil fuels are: -

1. Bio-fuels are sustainable as well as renewable resources (Razzak et al., 2013)
2. The toxic emission level via biofuel combustion is minimum (Surriya et al., 2015)
3. The Carbon dioxide emission is negated (Razzak et al., 2013; Surriya et al., 2015).

Figure 2. Different generation of biofuels



We can classify biofuel production into different generations as aforementioned in figure-2 (Hombach et al., 2016; Correa et al., 2017). First-generation feedstock biofuel is derived from cereal crops, sweet sorghum, Sugarcane, sugar beet and molasses for bio-ethanol production (Hemaiswarya et al., 2012) (Voloshin et al., 2016). Second-generation feedstock biofuel is derived from non-edible oils from *Jatropha curcas*, *Pongamiapinnata*, *Hevccabrasiliensis*, *Calophylluminophyllum,* which are usually used for biodiesel production (Hemaiswarya et al., 2012). Maity et al.(2014) stated that grass, wood and straw fall under second-generation feedstock biofuel. First-generation feedstock's biofuel and second-generation feedstock's biofuel are burdened with various concerns despite tax-credit policy and blending mandates, which permitted limited feedstock is to the energy market (Doshi et al., 2016).

First-generation feedstock biofuel and Second generation feedstock biofuel limitations: -

Dr. Ashok Rathoure (asokumr@gmail.com)

1. Jeopardising food safety owing to trade-off between fuel vs food.
2. Excessive land requirement.
3. High agricultural inputs
4. High investment cost
5. Hostile retail prices
6. Lower efficiency
7. Lower yield (Doshi et al., 2016; Juneja et al., 2013).

Due to these restrictions, researchers were looking for substitute feedstock and acknowledged a 3rd generation feedstock bio-fuel identified as algae, which insinuates numerous benefits as it, does not rely on edible crops, does not release elevated gaseous pollutants, and it does not require fertiliser or productive land (Mackenzie, 2013; Kim and Lee, 2015).

Several used macro-algae feedstocks are; some examples are *Enteromorphacompressa, Cladophoraglomerata, Ulva Lactuca, Laminaria*sp., *Macrocystispyrifera* (Chen et al., 2015; Xu et al., 2014). Third generation feedstock biofuel is primarily used to yield bio-diesel, which is along with chain alkyl ester, non-toxic with bio-degradable properties, carbon-neutral and nearly Sulphur-free, aromatics and its chemical, and energy properties are near to gasoline making it usable for the diesel engines without the requirement of minor to not at all adjustments (Luque, 2010).

2.1 Micro-Algae - Model for Viable Green Fuel

Micro-algae provide economic benefit, social benefit and environmental benefit using viable 3rd generation bio-fuel feedstock upon terrestrial oleaginous crops due to significant volumetric biomass, areal biomass, lipid yield, capability to adapt along with capability to grow in all sorts of water with a prospect of being grown all through year regardless of climatic changes (Ziolkowska and Simon, 2014; Ribeiro et al., 2017). Micro-algae have a high lipid content in contrast to oleaginous crops available in the market till now; that is, yearly algal oil production can be multiple folds to that of feedstock crop per ha. Additionally, compared to food crops, algae have a short doubling time and 20 to 30 times higher growth rate, providing multiple harvesting phases in a brief time (Chisti, 2007; Schenk et al., 2008; Ziolkowska and Simon, 2014). Bio-diesel produced from micro-algae can be used as a substitute for fossil diesel which can be very helpful to fulfil human's energy demand. Additional bio-diesel is carbon-neutral fuel, which means the quantity of CO2 released due to burning of bio-diesel stays equivalent to the amount of co2 absorbed by algae (Ziolkowska and Simon, 2014). For economic gains, carbohydrate's and lipids can be used for the production of various fuels such as gasoline, bio-ethanol, bio-diesel, bio-gas, hydrocarbon and jet fuel, while protein can be cast-off in feed, nutraceutical and food manufacturing, bio-fertilisers, surfactants, industrial enzymes (Griffiths et al., 2011; Yen et al.,2013). An additional economic value is that algae can be cultivated in sea-water, fresh-water, brackish-water, and sewage water (Cheng and He, 2014; Mata et al., 2010; Mathimani et al., 2017).

Micro-algae do not require basic cultivation needs such as portable water or fertile land. It can be easily cultivated off-shore or near-shore for biofuel, secluding land requirements. When comparing land use for algal fuel production to replace traditional fossil fuel, it would require less than > 1/7th of corn cultivated region of United States of America (Ziolkowska and Simon, 2014). Some governments provide various privileges such as cost-sharing, decreasing the total risk of the initial investment, providing subsidies on the bio-diesel production process (Su et al., 2015). Biofuel is an answer to climate change,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform

IP Address: 223.238.231.239

energy insecurity and other multifarious issues (Pradhan and Ruysenaar, 2014). Hence, the bio-fuel programs success is motivated by effective and efficient guidelines following up with bio-fuel yield from various feedstock and countries as shown in Table-2. Learning from Brazil's success, developing countries counting India should prepare a roadmap to boost bio-fuel missions, blend goals and provide grants within directives, missions, and biofuel policies. The forthcoming section will have enlightened India's comprehensive breakdown of the legal charter governing bio-fuel.

Table 2. Bio-fuel yield from various feedstock and countries

Crop	Countries	Bio-fuel	Bio-fuel Yield	Reference
Sugar cane	India	Ethanol	4522	(FAO, 2008)
Oil palm	Malaysia	Biodiesel	4736	
Oil palm	Indonesia	Biodiesel	4092	
Maize	United States of America	Ethanol	3751	
Maize	China	Ethanol	1995	
Cassava	Brazil	Ethanol	1863	
Cassava	Nigeria	Ethanol	1480	

3. THE CHRONOLOGICAL ASSESSMENTS OF THE BIO-FUEL LEGISLATION IN INDIA

With the enactment of the *Indian Power Alcohol Act,* 1948 (Act No. 22 of 1948), India got its first legislation on biofuel in 1948. Its primary objective was to empower India's 'power alcohol' industry (Cleveland and Morris, 2013). Earlier, in 2000 legislature has abolished this act (Indian Power Alcohol (Repeal) Act, 2000). Finally, in 2002 the Ministry of Petroleum and Natural Gas had released a notification on the *Ethanol Blending Programme*. From January 2003, the notification required 5% ethanol blending with petrol in 9 sugarcane supplying 3 Union Territories and States (Amit Aradhay,2010). The Ethanol Blending Program remained ineffective because of inaccessibility of sugar molasses, botched-up ethanol pricing formula, bureaucratic interruptions by State organisations, late purchasing, with several other factors (Ray et al., 2011).

3.1 Bio-diesel Program

The Indian government is pining to execute its bio-diesel programme for the welfare of green energy resources and rural employment. In order to fulfil this objective, in July 2002, with the guidance of NITI Aayog, the government formed the *Committee on Development of Bio-fuel*. In July 2003, the committee submitted the report. In taking into consideration the report, in 2003, the Indian government introduced *National Bio-diesel Mission*. The Mission has a particular emphasis on the *Jatropha* farming on wasteland. It has acknowledged the Ministry of Rural Development as a nodal ministry. National Biodiesel Mission has to achieve its objectives in 2 diverse stages. Stage-I comprises demonstration and experimentation, and it has to be executed by 2006-07 (Kumar Biswas et al., 2010). Stage-II was projected for seed purchasing, oil abstraction and nursery development plant along with setting up of

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

trans-esterification workshop lastly mixing and marketing of bio-diesel (Bandyopadhyay and Das, 2014; Kumar Biswas et al., 2010). Stage-II targets are encouraged to be complete. In 2005, the Ministry of Rural Development primed and submitted a comprehensive Project Report to the Indian government to discuss the pilot stage of biofuel feedstock crops (Mohan et al., 2006; Raju et al., 2012). Throughout the prime period, the Ministry of Petroleum and Natural Gas (in October 2005) had revealed the *Bio-diesel Purchase Policy*, which empowers oil marketing companies to purchase bio-diesel) at the cost of Rs. 26.50 per litre (inclusive of all taxes), with effect from 1 January 2006. Oil Manufacturing Companies intend to acquire bio-diesel that fulfils the criteria proposed by the Bureau of Indian Standards, and all procurement can be made only through recognised (20) centres.

Under Entry 14, List-II (State List) in Schedule 7 of the Indian Constitution, agriculture-related laws are enlisted, which empower the state government to make laws related to biofuel feedstock plantations which result in Union government-regulated petroleum-based companies with other private industries signing an MoU with state governments to promote biofuel feedstock on government-owned wasteland or unused lands through the method of contract farming with various farmers. In this initiative, significantly states governments have taken an interest in being part of the bio-diesel mission and promoting biofuel feedstock plantations with various instruments, including incentives and policies. Such states are Odisha, Uttarakhand, Rajasthan, and others few states (Venkataraman, 2012). The national bio-diesel mission has suffered setbacks due to lack of seeds, inefficient seed collection, extraction, and absence of knowledge and self-assurance in farmers and industry players. (Bandyopadhyay and Das,2014). The commercial production and sales of bio-diesel through the procurement centre is negligible.

The government conducted a study that states that farmers' failure to adopt scientific methods suffered a massive loss in lower production biofuel feedstock (Pradhan and Ruysenaar, 2014). The study also highlighted a shortage of seed and seed oil content, which led to the shutdown of various biofuel production units. Consequently, the National Bio-diesel Mission could not emerge successfully and was ended. Bio-diesel Purchase Policy faced the same fate of failure due to 'unrealistic purchase price' and subdued answers from Oil Manufacturing Companies (Kumar Biswas et al., 2010). In 2003 bio-diesel national Mission was announced; however, due to failure until 2008, the government could not implement a formal bio-fuel policy. As a result, in September 2008 'National Policy on Biofuels, was formulated and on 24 December, 2009, it was approved by the central government. Concerning the above, the next part tries to explore the National Policy on Bio-fuels, 2008, and pinpoint the weaknesses.

3.2 Key Characteristics of the National Policy on Bio-Fuels, 2008

1. The policy's primary purpose is to gratify bio-fuel demand and make certain accessibility of a minimum level of biofuels throughout the nation (Chandel et al., 2017).
2. The policy attempts to fast-track production of bio-fuel from non-edible oil feedstock's.
3. To confront the food *v fuel* debate (Murali et al., 2016; Rajagopal, 2008).
4. To draw the interest of foreign direct investment (Chandel et al., 2017).
5. Development of National Bio-fuel Coordination Committee.
6. To establish Bio-fuel Steering Committee.
7. Secretary to supervise policy implementation.

Dr. Ashok Rathoure (asokumr@gmail.com)

4. COMPREHENSIVE EXPLORATION OF THE NATIONAL POLICY ON BIOFUELS

4.1 Policy's Vision and Goals

- The Policy objectives are to make the biofuels market driver in the transportation and energy sectors in the future. The policy aims to accelerate development, promotion and production of biofuels and their usage to progressively replace diesel and petrol for transportation and stationary along with other applications, though backing to environmental concerns, creating employment ultimately directing towards sustainable development.
- The policy Goal is to safeguard the minimum level of biofuels at any given time easily accessible in the market to fulfil the requirement, by 2017 achieving the target of 20% biofuel blending for biodiesel and bioethanol.

4.2. Definitions and Scope

4.2.1 Characterisations of bio-fuels in the Policy

1. 'Biofuels' are liquid or gaseous fuels produced from biomass resources and used in place of, or in addition to, diesel, petrol or other fossil fuels for transport, stationary, portable and other applications.
2. 'Biomass' resources are the biodegradable fraction of products, wastes and residues from agriculture, forestry and related industries, as well as the biodegradable fraction of industrial and municipal wastes.

4.2.2 The Scope of the Policy Incorporates

1. 'Bioethanol': ethanol produced from biomass.
2. 'Bio-diesel': a methyl or ethyl ester of fatty acids.
3. Other bio-fuels: bio-methanol, bio-synthetic fuels.

4.3 Interventions and Enabling Mechanism

4.3.1 Plantations

The policy has discovered 400 kinds of trees in India that bear non-edible oilseeds, with the possibility of all of these species being used to produce biofuels. Farmers must obtain proper permission from local communities to use non-arable land. In 'Scheduled Areas,' where tribal tribes make up most of the population, the Panchayats Act, 1996 must be followed. The fifth Schedule of the Indian Constitution identifies these categories. It is worth noting that employment in non-edible oil seeds plantations will be included under the MNREGA, 2005. Policy guarantees that the Minimum Purchase Price for oilseeds

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

is met, and it will be executed with cyclic revisions. (Paras 5.1-5.5 of the National Policy on Bio-fuels, 2008; Patel et al., 2014).

4.3.2 Processing

The policy pushes India's government to launch a 'National Registry,' which would be in charge of developing and maintaining relevant data on biodiesel and bioethanol supply and regularly reviewing blending levels based on this data. The blending levels must meet BIS specifications and certification norms. As a result, processing industries and OMCs must collaborate to create a sound system for this cause. Motor engine manufacturers are permitted to do required modifications to present engines "to ensure compatibility with biofuels." Section 52 of the Motor Vehicles Act of 1988 similarly permits similar changes to Automobiles (Paras 5.6-5.10 of the Policy; Ray et al., 2012).

4.3.3 Financial and Marketing Enticements

In India, OMCs are responsible for the storage, distribution, and sale of biofuels; current systems must regulate these actions. The Bio-fuel Steering Committee will determine the Minimum Purchase Price for bio-fuel, which will be chosen by the National Biofuel Coordination Committee, which will examine the "entire value chain" when establishing the Minimum Purchase Price for biodiesel, and "real cost of production and import price of bio-ethanol" when determining the Minimum Purchase Price for bioethanol. (Paras 5.11-5.12 of the Policy). In the aftermath of a petrol or diesel price gap below the Minimum Purchase Price for bio-fuels, the government would reimburse the OMCs appropriately. (Ray et al., 2012).

The National Bank of Agriculture and Rural Development, the Indian Renewable Energy Development Agency, the Small Industries Development Bank of India, and other lending institutions are mandatory to offer monetary support toward the planting of non-edible oil feedstock's, as well as the establishment of oil processing and extraction units for bio-fuel production. It is worth noting that under the automatic route, FDI up to 100% is authorised in biofuel technology and projects, as long as the biofuel is only used for local consumption. For the plantation of non-edible oilseeds, however, foreign direct investment is forbidden. (Paras 5.13-5.15 of the Policy). The policy pushes the Indian government to establish a "National Bio-fuel Fund" to provide financial incentives, subsidies, and grants for novel and 2nd generation feedstocks. Bio-diesel and bio-ethanol will be exempt from all central taxes and levies, except for a 16 per cent exempt excise duty on bioethanol. Other special discounts were also available to establish bio-oil extraction plants and processing facilities. It is important to emphasise that biofuel imports will be permitted to a limited degree, as determined by the NBCC, and biofuel exports would be approved only when the domestic requirements have been met (Paras 8.1-8.2 of the Policy). Unlike other countries, India's policy does not encourage biofuel blenders and merchants. (Bandyopadhyay and Das, 2014).

4.3.4 R&D and Quality Standards for Bio-Fuels

R&D and Innovation would receive a massive boost from the policy in bio-fuels. Indigenous research and development will be given priority, and intellectual property will be safe and secured as needed. Research centres, Educational establishments, and businesses are encouraged to collaborate on research projects, and the appropriate funding will be granted. In order to achieve global technology, competitiveness and competence transfer must be accelerated (Para 5.19-5.22). The BIS issued IS-15607 for

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

biodiesel and I.S.: 2796: 2008 for bioethanol, based on ASTM D-6751 and EN-14214, respectively, American and European standards. The BIS must regularly assess existing standards to produce new standards-compliant with global benchmarks. (Paras 6.1-6.2).

4.4 State Governments Current Contribution

The policy promotes state government to develop and execute biofuel programmes actively. State governments must embrace biofuel policy and establish a nodal point to promote biofuels. (Paras 9.1-9.2 of the Policy). Many state governments have been aggressively participating in the backing of India's bio-fuel programme following the National Policy on Biofuels. Several states have previously produced or worked on biofuel policies and vision statements.

4.5 Institutional Mechanism

The Prime Minister would spearhead the formation of the National Biofuel Coordination Committee, which offers élite coordination and policy supervision. In order to properly monitor and administer biofuel programmes, the National Bio-fuel Coordination Committee must convene regularly. The Deputy Chairman of the Planning Commission, the Ministry of New and Renewable Energy (as coordinating Ministry), the Ministry of Rural Development, the Ministry of Agriculture, the Ministry of Environment and Forests, the Ministry of Petroleum and Natural Gas, the Ministry of Science and Technology, and the Secretary of the Ministry of New and Renewable Energy make up the National Bio-fuel Coordination Committee. (Part 11 of the Policy). A Bio-fuel Steering Committee will be formed to oversee the policy's implementation under the Cabinet Secretary governance. The BSC comprises eleven Secretaries from the Indian government's various Ministries and Departments. Several ministries participated in policymaking, development and promotion of biofuels at the national level, and each Ministry must coordinate with the others. Several programmes have been launched in India to encourage the development of biofuel crops. For example, the Agriculture Ministry established the Integrated Development of Tree Borne Oil Seed Scheme, which offers farmers and non-governmental organisations financial assistance to cultivate tree-borne oil seeds. (Dalemans et al., 2018; Raju et al., 2012).

4.6 Major Limitations to Accomplish Objectives Established Under India's Biofuel Policy

Even after constant decade-long efforts in developing biofuel and its promotion, India's accomplishment was not up to the desired mark. India's progress is far behind several other countries (Kumar Biswas and Pohit, 2013). As a result, the aims outlined in India's Bio-fuel Policy appear to be "unrealistic" in light of succeeding facts. (Kumar Biswas et al., 2010).

1. Land Restrictions for the Cultivation of Biofuel Crops

Non-edible oil crops must be planted exclusively on "wastelands" in non-forest and forest areas, according to paragraphs 1.5 and 5.1 of the policy. It is worth noting that the policy does not explain the term "wasteland." The writers were able to track the meaning of 'wasteland' back to the colonial authorities, who defined it as "land that did not generate any tax since it was uncultivated," which included

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

everything from semi-jungle to forest, and marshes land to dry fields (Kumar Biswas et al., 2010; James and James, 1999). Lord Canning devised the 'wasteland rules' in 1861 to manage the profits earned by the uncultivated areas. There are several government categories for wastelands in India, including two principal classifications, ninefold classifications, and the Wasteland Atlas. (Baka, 2014). Besides, a large chunk of wasteland is being illegally encroached by landless labours and poor people; too which government has no available record of (Kumar Biswas et al., 2010). The State Governments must finalise the government wasteland and its usage and given for plantings, according to paragraph 9.2 of the policy. According to reports, India has no legislation for delineating non-cultivable wasteland appropriate for bio-fuel (mostly Jatropha) growth. Furthermore, the appropriation of arable land for the growth of biofuel crops has created significant socio-economic challenges that have hampered the Bio-fuel Policy's implementation (Kumar Biswas et al., 2010; Bastos Lima, 2012).

2. Rational Problems in Feedstock Cultivation

According to the Indian government, feedstock farming is now included in the MGNREGA scheme. Jatropha was the first crop that came to mind. By 2012 Indian government has resolute Jatropha plantation on 11.2 million hectares to 13.4 million hectares of land to come across a bold target of 10% bio-diesel-diesel blending mandate. Researchers and policymakers appear to misjudge the harvest of the Jatropha plant in sub-optimal growing situations (Sreenivas et al., 2018; Bastos Lima, 2012). It was also discovered that policymakers did not refer farmers when making such judgments. Overall, farmers cultivate Jatropha solely as a fence crop, and low crop yields discourage farmers (Bastos Lima, 2012).

3. Discrepancy in State Tax Structures

The policy stipulated a 16 per cent reduction on tariff on bio-ethanol and the elimination of all central taxes and duties on bio-diesel and bio-ethanol. On the other hand, state tax policies are not all the same, and they may differ from state to state. Even though each state has its excise tax, biodiesel is exempt from the federal excise tax of 4% as economic motivation. Raju et al. (2012) demonstrated that the policy's heterogeneous tax structure provides a roadblock to its timely implementation. Due to differing state legislation and administrative controls, biofuel's swift and unrestricted movement across state boundaries has been hindered.

4. Distinct Species of Non-Edible Oil Feedstock and their Suitability

The policy's paragraph 5 lists 400 kinds of non-edible seed-bearing trees in the country, although actual trials focus solely on the Jatropha. Some research is done by developing genetic improvements to plant kinds, nevertheless with minor achievement. An alternative explanation is that biodiesel production in India is based upon the Jatropha plant, proven to be commercially impractical due to lower yield, poor seed quality, and promotion issues. (Slette and radhey, 2014). According to Kumar Biswas and Pohit (2013), most research concentrates on plant-based materials. However, it neglects other elements such as soil conditions and agro-climatic factors, which stay necessary for boosted crop output.

5. Organisational limitations

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

National Bio-fuel Mission had planned to create the National Bio-fuel Development Board but later dissolved for unspecified reasons. The government has failed to establish any establishment proposed in the national biofuel mission to ease the transfer of benefits straight to farmers; therefore, it is essential to tackle these problems within prevailing established machinery or create innovative machinery (Kumar Biswas et al., 2010).

4.7 Recent Developments

To generate awareness and stimulate biofuel in India, on an industry level, the Ministry of Petroleum and Natural Gas, in synchronisation with the Petroleum Conservation Research Association, has launched a *Working Group* (PTI, 2015). The central government will amend the National Policy on Bio-fuels and Motor Spirit and High-Speed Diesel Control Order to ease bio-fuel sale (Business Line, 2015). Also, the Indian government is anticipated to disclose a Strategy on 'Flexible-Fuel Cars', which can operate either bioethanol or on petrol or its combination. These 'flex-fuel vehicles' will play a crucial role in fighting ever-increasing pollution and boosting ethanol consumption.

5. A WAY FORWARD

Through intensive study, it has been pointed that the Oil Manufacturing Company's solitary dependence on the ethanol produced from molasses confines enactment of the Ethanol Blending program. As recommended by Standing Committee on Petroleum & Natural Gas, we have again restated that "other than sugarcane, ethanol can be produced from corn, maise, wheat and food grains having high starch content", which has efficaciously executed in the United States of America. We can use various short generation biofuel feedstock crops that can be easily raised on monsoon-dependent agricultural lands, which could play an essential role in increasing the total productivity of biofuel feedstock and improving farmers' income. So, the Indian government must distribute the apposite amount of resources to fast-track the current Research and Development in manufacturing ethanol. The Indian government has to revive all the committees made under the policies and coordinate among other ministries to make up a comprehensive plan for effective implementation of the Bio-fuel program. The government must review its policies and make changes to have a fruitful bio-fuel program if required.

6. CONCLUSION

There are four vital types of machinery for any biofuels to succeed if taken into run-through, i.e., economics, technology, policy support, and environmental sustainability. Researchers emphasised various challenges for commercially viable biodiesel production, such as cultivation, harvesting, and production costs. However, legal issues and its solution with bio-fuel marketing in the energy sector are still not extensively considered, particularly in emerging countries like India. Unless we have policy support, we cannot convert beneficial technology into practical usage. Incidentally, India's biofuel policy accepted obligation in blending ethanol and bio-diesel programs. Still, the biofuel program did not earn significant success primarily due to biomass cultivation cost and the food vs fuel conflict. Henceforth, this chapter addresses the micro-agal feedstock potentials in biofuel production in addition to the policy concerns,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

which hampers its commercialisation in India. This chapter also displays important data related Indian government's national Bio-fuel Policy, which encompass legal hurdles for biofuel marketing. It focuses on the Indian government initiative to address industries problems regarding the bio-diesel program. Ethanol blending and its various policies. In order to accomplish India's aspiring biofuel targets, there needs revolution throughout the grass root levels, especially from the public and government are required for prosperous biofuel future in India.

ABSTRACT

Changes in weather patterns over decades or longer periods of time are referred to as climate change. Natural and human forces both contribute to climate change. Since the Industrial Revolution, humans have contributed to climate change through emitting greenhouse gases and aerosols, as well as changing land use, leading global temperatures to rise. More storms, floods, droughts, and rising sea levels may result from increasing global temperatures and the melting of ice sheets, sea ice, and glaciers. The sun's rays supply energy to the whole world. GHGs are required to trap heat and maintain a temperature that permits life to flourish on the planet. The greenhouse effect is a natural and necessary occurrence for life on Earth to survive. If the greenhouse effect did not exist, the world would be around 33°C cooler right now. Humans have contributed to the increase in atmospheric GHGs via rising fossil fuel usage and deforestation in recent decades. Increased GHG emissions have been the primary cause of global warming during the last century.

INTRODUCTION

Since 1850, three primary datasets have been used to calculate global surface temperatures. These figures indicate a warming of +0.8°C to +1.0°C since 1900. 4 Since 1950, land-only data has shown increasing trends of +1.1°C to +1.3°C, indicating that land temperatures respond to climate change quicker than ocean temperatures. While multi-decadal time periods (30 years or more) are often used to assess global warming, attribution of trends over shorter time periods may be problematic due to natural variability.

Natural climatic variability is caused by internal interactions between the atmosphere, ocean, land surface, and sea ice. These oscillations happen whether or not there is climate change, and are generally referred to as "noise" or natural changes around a "normal" figure. Temperature rises as GHG levels increase, which has a substantial indirect influence on water vapour. Due to the greenhouse effect of water vapour, greater global temperatures induced by GHGs increase the atmosphere's capacity to store water vapour, resulting in a positive feedback loop. The quantity of water vapour in the atmosphere increases by roughly 7% when the global temperature rises by 1°C. (Dones et al., 2016; Frischknecht et al., 2003; Inter-Governmental Panel on Climate Change (IPCC), 2001; Villigen & Swiss, 2003)

Water vapour is a potent and quick feedback that increases any initial force by two to three, despite the fact that CO2 is the most significant human control knob on climate. Water vapour is a large contribution to climate change, despite the fact that it is not a significant beginning force. By continuing to address criteria pollutant nonattainment issues, state and municipal governments may accomplish significant GHG emission reductions. The most efficient approach to accomplish this goal is to ensure that the techniques utilised to achieve emission reductions for criteria pollutant compliance also provide benefits in terms of GHG reduction, rather than ineffective or counterproductive GHG reduction efforts. Because strategies that reduce GHG emissions nearly invariably result in reduced emissions of other air pollutants, STAPPA and ALAPCO believe it is vital to focus on the link between GHG mitigation and conventional air pollution management. The most well-known harmonised procedures are used to address CO2, particle matter (PM), nitrogen oxides (NOx), sulphur dioxide (SO2), carbon monoxide (CO), and air toxics, all of which are important CO2 sources. The most harmful greenhouse gases include CO2, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulphur hexafluoride. Ozone precursors (NOx and NMVOCs) have an indirect greenhouse effect since they are also GHGs. The focus of this study is on CO2 for two reasons. To begin with, CO2 is thought to be responsible for more than half of the expected global warming consequences. In 1997, CO2 emissions accounted for almost 82 percent of total emissions in the United States. (Dones et al., n.d.; Hondo, 2003; Lee, 1997; Ozawa et al., 2003; Spath et al., 1999). GHG emissions refer to the amount of greenhouse gases released into the atmosphere. Second, the primary source of CO2 is fossil-fuel combustion, which is governed by state and local governments via emission categories. According to the Intergovernmental Panel on Climate Change (IPCC), the Earth's climate system is continually changing, both worldwide and locally, with some of the changes linked to human activity and resulting in greenhouse gas emissions. Energy delivery systems, especially fossil-fuel systems, are the principal contributors to these gas emissions. This article primarily leverages data from a recent Swiss study addressing Life-Cycle Assessment (LCA) issues based on environmental inventories of European-wide energy systems to provide GHG emission comparisons.

The ocean covers 71% of the Earth's surface and is home to 1.3 billion cubic kilometres of salty water. This enormous body of water has a huge influence on the global environment. It functions as a global thermostat, lowering heat gradients induced by differences in incoming solar radiation over time and space, controlling the composition of numerous trace chemicals in the atmosphere, and functioning as a dump for a range of manmade toxins. Climate fluctuations are often connected to changes in the atmosphere (Fraedrich, 2001; Fraedrich et al., 2005; Fraedrich & Lunkeit, 2008; Kunz et al., 2008; Lorenz, 1955). However, analysing the atmosphere on its own is challenging. The land, oceans, and ice-covered regions of the Earth's surface are all intricately tied to the atmosphere (known as the cryosphere). The biosphere, which comprises both terrestrial and marine biological systems, has a substantial relationship.

CLIMATE CHANGE

The atmosphere, land, ocean, cryosphere, and biosphere make up the basic framework of the climate system. The ocean has an impact on the rate at which greenhouse gases are emitted. This is performed by absorbing surplus greenhouse gases from the environment, as well as some greenhouse-induced heat. Both of these measures contribute to slowing global warming. The global ground-level temperature of the atmosphere would presently be one to two degrees Celsius higher if it weren't for the cooling effect of the ocean. The question is whether the ocean will continue to counteract global warming, and whether the rate at which it does so will slow or speed up over time. We need to know the precise answers to these questions before we can determine the total amount of global climate change. As a consequence, further study is required on (1) gas exchange processes at the air-sea interface, with an emphasis on CO:, (2) greenhouse gas transit routes from the surface to the ocean's deep layers and sediments, and (3) ocean circulation characteristics.

The wind is the primary driving force behind the ocean's surface circulation, which moves heat and water in horizontal planes. Excessive evaporation on the sea surface from thick water descending towards the ocean's core causes the thermohaline circulation to cool and/or increase salt content. On the one hand, this process allows deeper ocean layers to interact with the atmosphere, but on the other hand, it "opens" the huge volume of the deep ocean, allowing it to store heat and CO2. This sinking of heavy surface water may now only be seen in a few isolated areas of the ocean. Deepest convection occurs in the northern North Atlantic (Norwegian and Greenland Seas) and near Antarctica (Weddell Sea). Warm surface water in the North Atlantic is cooled, allowing more CO: to dissolve before sinking as equally salty water into the deep ocean, where it has a long history of interaction with the atmosphere. After being kept off from direct touch with the atmosphere for a long time, upwelled deep water in the Southern Hemisphere swiftly transforms into colder, denser water with a high CO2 content and re-enters the ocean's deep and bottom layers.

As these two water masses spread across the ocean, each with its own set of characteristics, the "resident" deep ocean water rises slowly but progressively. The rate and method of deep water creation, as well as oceanic heat transfer to high latitude continental areas, are all determined by surface water circulation in the North Atlantic. Excess salinity (and the associated heat flux, which is controlled by the rate at which surface water flows into the Atlantic) generates strong oceanic fronts, defines the boundaries between ice-covered and open ocean areas, and heats northern Europe. The whole system has been found to be exceedingly unstable across decadal, historical, and geologic time periods. Little changes in the sea ice limit, as well as salinity, temperature, and volume of inflowing surface waters, may have a substantial influence on Europe's climate, economy, and living conditions, according to historical records..

Scientists, engineers, industry, and regulators are all interested in the future role of hydrogen H2 as a synthetic fuel and energy carrier. In the future, hydrogen is likely to play a larger role in transportation. An internal combustion engine or a fuel cell may be used to create a hydrogen-powered vehicle. In the second method, hydrogen is burnt. Electrochemical traction is created in a fuel cell, which then supplies energy to power an electric motor. A fuel cell car's efficiency in converting chemical energy to mechanical energy might be far higher than that of a normal gasoline-powered internal combustion engine vehicle. Hydrogen's attraction as a future transportation technology derives from its capacity to boost overall economic growth while drastically reducing environmental pollution. Hydrogen generation, storage, delivery, and usage in all aspects of the energy economy, including transportation, will be major problems for any future hydrogen economy. To ensure that overall environmental damage is avoided

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

and the full potential of hydrogen as a clean fuel is realised, thorough environmental evaluations will be necessary for all technologies employed at each step, from synthesis to usage.

We examine what we know about hydrogen's fate and behaviour in the atmosphere, as well as its major sources and sinks. Hydrogen is a greenhouse gas, contrary to common assumption, and its global warming potential is evaluated in contrast to carbon dioxide. Then we assess the global warming implications of switching from a fossil-fuel to a hydrogen-based energy source. The researchers found that substituting hydrogen-based energy systems for fossil-fuel-based energy systems would only result in a minor reduction in global warming unless hydrogen leakage from any future hydrogen economy is tightly monitored. Gases that trap heat in the atmosphere are referred to as "greenhouse gases" (GHGs). Carbon dioxide, for example, is naturally created and released into the atmosphere as a consequence of both natural and human activities. Humans are the only ones who manufacture and release other greenhouse gases, such as fluorinated gases. The most major greenhouse gases that enter the atmosphere as a consequence of human activity are carbon dioxide, methane, nitrous oxide, and fluorinated gases. The behaviours described above are frighteningly similar to those that occur in the Earth's climate system. Shortwave solar radiation from the Sun reaches the planet's surface, where it is absorbed and heated by the planet's comparably clear atmosphere. The gross radioactive flux density generated by the planet's surface (land, water) much outnumbers the input irradiative flux density received from the Sun, just as a person's thermal infrared radiation far outnumbers his or her caloric intake on a global and annual average. The atmosphere absorbs thermal infrared radiation from the planet's surface, which is subsequently heated and radiates, in part downward toward the surface.

Due to downwelling infrared radiation from the atmosphere to the surface, the net upward infrared flux from the surface is significantly decreased in contrast to the gross blackbody flux. The greenhouse effect assumes that a greenhouse maintains its heat by collecting and releasing longwave radiation via its glass surfaces. (True greenhouses maintain their warm temperatures by preventing warm air from flowing away from the surface.)

GREEN HOUSE GASES

In the atmosphere, a greenhouse gas absorbs and emits heat infrared radiation. This method is the source of the difficulties. The principal greenhouse gases in the Earth's atmosphere include carbon dioxide, chlorofluorocarbons, methane, and nitrous oxide. The following are the greenhouse gases that produce an increase in air and earth temperature and are present in the troposphere: CO2 is a substance that exists in the form of a gas. It contributes to global warming by producing around 55% of the greenhouse gases produced by human activities. The chief causes are fossil fuel combustion (67 percent), deforestation, and various kinds of land removal and burning (33 percent). CO2 levels in the atmosphere were 355 parts per million in 1990, and they are growing at a 1.5 parts per million per year pace. CFCs account approximately 24% of all greenhouse gas emissions created by humans. They also deplete the ozone layer in the stratosphere. CFCs are mostly generated through leaky air conditioners and refrigerators, among other sources. CFC levels in the atmosphere are now at 0.00225 parts per million and growing at a rate of 0.5 percent per year. Methane is responsible for 18% of the global increase in greenhouse gas emissions. When microorganisms break down dead organic material in damp, oxygen-deficient environments like swamps, natural wetlands, paddy fields, landfills, and the digestive tracts of cows, sheep, and termites,

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

methane is produced. The current amount of methane in the atmosphere is 1.675 parts per million, and it's growing at a 1% yearly rate.

Human-caused carbon dioxide emissions account for 6% of total emissions. The breakdown of nitrogen fertilisers in soil, animal wastes, and nitrate-contaminated groundwater, as well as the burning of biomass and nitrogen-rich fuels, all contribute to its production (particularly coal). The atmospheric concentration of N20 is 0.3 parts per million, and it is increasing at a rate of 0.2 percent each year. One of the main objectives of climate research is to figure out how the statistical characteristics of the climate system vary when the value of external or internal factors changes. It was recently shown that an approach for quasi-equilibrium systems may be quantified and has formal connections to Kubo 20 response theory. The irreversibility of the ten climate systems, notably their entropy production, is the emphasis. The maximal entropy production principle (MEPP) asserts that an out-of-equilibrium nonlinear system adjusts to maximise entropy formation. Despite the fact that MEPP's general validity is in question, it has proved effective as a heuristic in 15 climate research, requiring a full re-evaluation of entropy generation's function in the climate system. This has fuelled a push to adopt a new generation of diagnostic tools based on the second law of thermodynamics for auditing climate models and defining a set of parameterizations for use in conceptual and intermediate complexity models, as well as recreating historical climate conditions.

Carnot efficiency, entropy production, and the degree of climate system irreversibility are all linked to climate system irreversibility. As a consequence, it is now possible to conduct a new fruitful inquiry into the onset and decrease of snowball conditions as a function of solar constant changes. The research makes use of Planet Simulator, a lightweight climate model (PLASIM). Ignoring mixing processes and assuming local thermodynamic equilibrium, this remains true everywhere except in the upper atmosphere, where there is no mass. For estimating the steady-state climate response, slab ocean climate models are excellent. The global atmospheric energy balance is much improved over prior versions of the model by re-feeding the kinetic energy losses owing to surface friction and horizontal and vertical momentum dispersion.

The sensitivity of all three temperature indicators is positive, as expected: the sensitivity of the surface temperature is well within the range anticipated by IPCC climate models, while the sensitivity of the two bulk thermodynamic temperatures is lower. Atmospheric thermodynamics is the study of heat-to-work (and vice versa) changes in the earth's atmosphere in relation to weather and climate. In addition to the globally averaged surface temperature, the intensity of the Lorenz energy cycle, the Carnot efficiency, the generation of material entropy, and the degree of irreversibility of the system are all linear with the logarithm of CO2 concentration. The generalised sensitivity diagram below shows how when the climate system warms, it gets less efficient, more irreversible, and creates more entropy. Changes in the intensity of latent heat fluxes are the most critical components, emphasising the need of addressing climate change's influence on the hydrological cycle at a fundamental level. All variables may be effectively reparameterized with reference to just this one due to the identified variables' monotonic (and, in particular, linear) reliance on the logarithm of CO2 concentration.

Using a basic yet Earth-like climate model and a novel theoretical framework, we study the influence of global warming on climate system thermodynamics. In addition to the globally averaged surface temperature, the intensity of the Lorenz energy cycle, the Carnot efficiency, the generation of material entropy, and the degree of irreversibility of the system are all linear with the logarithm of CO2 concentration. These high sensitivity levels imply that as the climate heats, it becomes less efficient, more irreversible, and more entropy is produced. Using the essential notions of classical thermodynamics,

atmospheric thermodynamics investigates processes such as moist air properties, cloud formation, atmospheric convection, boundary layer meteorology, and vertical stability in the atmosphere. Atmospheric thermodynamics is concerned with water and its changes. Among the subjects covered are the ideal gas law, specific heat capacities, adiabatic (entropy-conserving) processes, and wet adiabatic processes. The bulk of troposphere gases are made up of water vapour, which is one of the most important trace components of air.

The essential function of atmospheric thermodynamics is described in basic equations of air motion, which are either grid resolved or subgrid parameterized, in terms of adiabatic and diabatic forces acting on air parcels. Numerical weather and climate predictions are created using these equations. The sun provides heat to the Earth. The Earth and its atmosphere emit heat into space. They disperse the bulk of the solar heat, maintaining the Earth's normal temperature. Greenhouse gases warm the Earth and envelop it in a warm blanket. According to the second law of thermodynamics, heat cannot flow spontaneously from a lower-temperature substance to a higher-temperature material. "Global warming" is one of the most often used words in environmental study. The temperature of the Earth has been continuously increasing over the last five decades. Many experts believe that effective and acceptable pollution control techniques are urgently needed. Humans are exposed to a variety of harmful gases, each of which creates its own set of health problems. Carbon dioxide, sulphur dioxide, and hydrogen sulphide are among the gases that may be removed from exhaust gases using various processes. As a consequence of greenhouse gases, shortwave radiation may enter the earth's atmosphere, heating the land and oceans. Long-wave radiation from the earth's surface is unable to reach the atmosphere due to these greenhouse gases. These activities contribute to the greenhouse effect. A large number of scientists have looked into greenhouse gases, their impacts, and potential remedies. The research and studies on greenhouse gases are the topic of this review. The greenhouse effect has produced considerable global warming in recent decades, notably in the past four to five decades. Warmer temperatures extend the growth season and make frigid areas more livable in general. When utilised in a high-intensity way, natural gas produces more greenhouse gases than fossil fuels. Carbon dioxide (CO2) and methane (CH4) are two climate-changing gases (CH4). The temperature of the Earth has been continuously increasing over the last five decades. Many experts believe that effective and acceptable pollution control techniques are urgently needed. Humans are exposed to a variety of harmful gases, each of which creates its own set of health problems. The research and studies on greenhouse gases are the topic of this review.

Many of us can eat without much thought, preparation, or time thanks to contemporary culinary technology. Fast food, ready-to-eat meals, and processed snacks give quick nutrition while causing the least amount of interruption to our daily routines. The immediate impact of a satisfied appetite is obvious, but the environmental impact of food and agriculture is less apparent. Recent publications, such as Michael Pollen's The Omnivore's Dilemma, have questioned whether a more ecologically friendly food system is feasible. Furthermore, the effects of global climate change raise worries about food's carbon footprint. This short will examine the most up-to-date scientific studies of food and climate systems in order to assist us in making intuitive and environmentally sound eating decisions. Greenhouse gas emissions are produced through food production, packaging, transportation, sale, and consumption.

Food-related processes, such as soil nitrous oxide generation, produce three major greenhouse gases: carbon dioxide, methane, and nitrous oxide. Depending on their persistence (how long they stay active) and impact, various GHGs in the atmosphere have varied global warming potentials. Because methane remains in the atmosphere for a shorter period of time while absorbing more heat, it has a greater cumulative impact than carbon dioxide. Nitrous oxide is the most potent global warming gas.

Food's carbon footprint is a similar measure of the impact of global warming (also known as CO2e: carbon dioxide equivalent). The carbon footprint of a single unit of food refers to the total amount of greenhouse gas emissions produced by that unit of food. Food consumption accounts for around 15% of total GHG emissions in the United States. We may work to reduce GHG emissions in a variety of "hot spots" across the food chain.

In the United States, agriculture contributes for around 6% of total GDP, which includes all agricultural processes but excludes those beyond them. GHG emissions refer to the amount of greenhouse gases released into the atmosphere. Though we may make educated predictions, exact data on agricultural GHG emissions in the United States is difficult to come by owing to the country's diverse food supply and consumption. Agriculture is the largest source of GHG emissions, which are mostly caused by microbial activity in the soil and manure. When fossil fuels are used to power agricultural machines, carbon dioxide is created. When fertiliser emissions escape from the soil, they constitute a substantial source of nitrous oxide emissions into the atmosphere.

There are many procedures involved in getting food to markets. Food miles, or the average distance travelled by food from farm to fork, are a measurement of the food system's transportation infrastructure. According to the Leopold Center, produce supplied to the upper Midwest travels an average of 1,500 kilometres from industrial centres throughout the continental United States. Food transportation is responsible for around 11% of total GHG emissions from the food chain. Experts believe that changes in technology and infrastructure will contribute in the decrease of emissions related to transportation.

Food consumption is the second-largest source of greenhouse gas emissions in the household, behind transportation. The energy needed for refrigeration is one of the primary GHG consequences of food production. Certain commodities need continual refrigeration as soon as they leave the farm. Food waste wastes the energy needed to produce it, as well as the greenhouse gas emissions produced as a consequence. Meat waste in retail, industry, and households accounts for 20% of the meat sector's total GHG emissions (How to reduce home emissions is discussed further down.)

The proportional GHG emissions from these three food chain components vary depending on the kind of food. Livestock and meat production release more greenhouse emissions than plant-based agriculture. When cooked and stored, plant-based proteins like lentils and dry beans contribute significantly to total emissions.

Agriculture produces three major greenhouse gases: carbon dioxide (CO2), methane (CH4), and nitrous oxide (NOx) (N20). While nitrous oxide and methane are the most common greenhouse gases in the atmosphere, they have longer atmospheric lifetimes and absorb more long-wave radiation. As a consequence, even little volumes of methane and nitrous oxide might significantly contribute to global warming. Agriculture may have both good and negative consequences as a result of climate change. According to several studies, warmer temperatures lengthen growing seasons, and more carbon dioxide in the air leads to higher agricultural productivity. As a result of increasing temperatures and decreased soil moisture, production patterns may shift northward, demanding greater irrigation. Changes, on the other hand, will most likely vary significantly from one location to the next. Geographical factors will have a big impact on agriculture's potential to benefit from climate change. While some projections seem to be optimistic in certain areas, the risk of increased climatic unpredictability and extremes is not always included. Droughts, heat waves, severe thunderstorms, and tornadoes may become more common, outweighing the agricultural advantages. Farmers are finding it increasingly difficult to respond as climate change becomes more unpredictable.

The two categories of greenhouse gases generated by biomass power plants that contribute to global warming are direct and indirect greenhouse gases. Direct greenhouse gases include carbon dioxide (CO2), nitrous oxide (N2O), and methane (CH4). Indirect greenhouse gases include NMVOCs, nitrogen oxides (NOx) (nitrogen monoxide (NO) and nitrogen dioxide (NO2)), sulphur dioxide (SO2), and carbon monoxide (CO). By absorbing and storing infrared radiation released by the earth's surface and lower atmosphere, and then reflecting it back to the planet's surface, direct greenhouse gases contribute to global warming. The environment is a system of systems that is a component of a higher system of systems, the human system, from the perspective of human life and development. Because it is clear that preserving and mending the environment in the interests of human life and growth is difficult, it is also impossible to damage the environment indiscriminately because it is the medium through which humans live. As a result, we must create compromises based on our knowledge and experience that respect both human and environmental concerns. Their effect and advantages are tracked so that remedial action may be taken if necessary.

According to current research, sustainability (development) involves not just the environment, but also the whole human system as well as the fundamental assets (i.e. public assets) on which people rely. Infrastructures and technologies, particularly those that are crucial, as well as the environment, property, and public welfare, are all important assets in the human system. Sustainability assessment is a method for recognising, anticipating, and assessing the influence of arbitrary inputs, such as fluctuations, on society's long-term growth in a broad sense (e.g. legal rules, ordinances, regulations, political intent, plan, program, and project). The aforementioned evaluation, which is based on current knowledge of the human system and its assets, may be conducted at any time to ensure effective territory management. The evolution of the environment, as well as the global political, social, and economic situation, demonstrates the need to address cases and actions that, because of their gravity, result in critical situations that lead to relevant crises of the type denoted as a humanitarian catastrophe or social crisis. As a result, a safety concept linked to development principles produced and accomplished through safety management is necessary from the viewpoints of human security, human system development, quality environmental conservation, state existence, stability, and development..

Basic (or normal) management, which is connected to emergency and crisis management, aims for security and long-term growth. As a result of land and regional growth, industrial zones are becoming closer to residential neighbourhoods. As a result, the potential of harm rises, and society (community) refuses to take any chances. Risk management, and by extension risk engineering, which involves risk assessment, risk reduction, and harm explanation, is critical in this situation. Finally, risk engineering is linked to technological systems (the human factor's impact on complex process safety is only addressed in advanced versions), and it may be utilised to revitalise landscapes by applying engineering principles in a wider sense.

As a result, risk management is essential. On the one hand, it aims to provide the best possible protection for people, property, and the environment, while on the other, it aims to restore damaged landscapes utilising engineering techniques and results. One of the most important concerns confronting the globe today is environmental deterioration. Some settings may never be retrieved, depending on the extent of the loss. Flora and wildlife that formerly thrived in these areas are now extinct. City planners, industry, and resource management must address the long-term environmental implications of expansion to minimise future repercussions. Future environmental damage might be avoided with proper planning. Despite the fact that human activities are often connected to environmental deterioration, ecosystems adapt throughout time. Some ecosystems deteriorate over time, whether or not they are touched by hu-

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

man activity, to the point that they can no longer sustain the life that is "meant" to live there. Landslides, earthquakes, tsunamis, and wildfires all have the potential to devastate local plant and animal ecosystems, rendering them untenable. This might happen as a result of a natural catastrophe or long-term resource deterioration caused by the introduction of an invasive alien species into a new ecosystem.

When the environment is unable to deal with the new species, degradation occurs. These contaminants may build up in sediments and biomagnify in the tissues of top-of-the-food-chain animals, resulting in concentrations many times greater than those seen in water or air. Ozone is a gas that may be found on the ground as well as in the stratosphere, the Earth's upper atmosphere. Ozone is a contaminant that may impair people's health at ground level. On the other side, ozone creates a stratospheric layer that shields life on Earth from the sun's destructive ultraviolet (UV) rays. Ozone-depleting substances like chlorofluorocarbons, hydro chlorofluorocarbons, and halons are man-made chemicals that slowly deplete the "healthy" ozone layer. These chemicals have been used as coolants, foaming agents, fire extinguishers, solvents, insecticides, and aerosol propellants in the past, and they are still used in certain situations today. More UV radiation penetrates the Earth as the protective ozone layer thins, possibly causing skin cancer, cataracts, and immune system damage. UV radiation has the potential to harm delicate crops, such as soybeans, resulting in lower yields.

CONCLUSION

Environment-related ramifications Toxic contaminants in the air, as well as those deposited on soils and surface waters, may harm animals. Animals, like people, may develop health issues if they are exposed to excessive levels of air toxics over time. Air toxics have been linked to birth abnormalities, reproductive failure, and illness in animals, according to a study. In aquatic ecosystems, persistent hazardous air pollutants (those that take a long time to degrade in the environment) are of special concern. Air pollution has a range of effects on crops and plants. Ground-level ozone may diminish agricultural crop and commercial forest yields, smother tree seedling development and survival, and make plants more susceptible to disease, pests, and other environmental challenges (such as harsh weather). Acid rain and increased UV radiation due by ozone depletion may have an influence on agriculture and forestry, as previously stated. Climate change is happening on a global scale. Because of a complex mix of naturally existing gases in the Earth's atmosphere, some of the sun's heat is preserved near the surface. The "greenhouse effect" maintains a steady temperature on the earth. Unfortunately, evidence is accumulating that people have disrupted nature's equilibrium by emitting vast volumes of greenhouse gases such as carbon dioxide and methane. As a consequence, the Earth's atmosphere seems to be retaining more of the sun's heat, leading to global warming. According to many experts, climate change will have significant consequences for human health, agriculture, water resources, forests, animals, and coastal regions.

ABSTRACT

The planet's limited natural fossil fuel reserves are anticipated to be very soon owing to massive usage. Biofuels would be a critical alternative source that may reduce global warming and CO2 emissions. The food-versus-fuel dilemma is, however, one of the key drawbacks of first-generation biofuels like corn ethanol, sugarcane ethanol, etc. Cellulose and hemicellulose, the primary constituents of lignocellulosic feedstocks, could be reduced to sugars by either thermochemical/biological processes before being fermented to generate biofuels. However, owing to structural heterogeneity, more complicated operational techniques are required before the production technology can be commercialized, and several challenges must be addressed. This chapter provided an assessment of various feedstocks, availability, various processing techniques, obstacles, and current technical developments in the generation of biofuels from biomass.

INTRODUCTION

The earth's finite natural fossil fuel reserves are being exhausted at a quicker pace as the world's energy demands rise as a result of advances in industrialization and modernization (Mohapatra, Ray, & Ramachandran, 2019; Ruan et al., 2019; Saini, Saini, & Tewari, 2015). Petroleum, coal, natural gas, bitumen, oil shales, and tar are examples of fossil fuels that have aided in the wealth and success of many nations throughout the world, as well as meeting energy demands for power, transportation, and heating (Dahman, Dignan, Fiayaz, & Chaudhry, 2019). Fossil fuels account for almost 80% of all primary energy use. With the transportation sector accounting for only 58% (Raud, Kikas, Sippula, & Shurpali, 2019). From a global point, the energy and transport industry is associated with heavy fossil fuel consumption (Dahman, Dignan, et al., 2019). As the world's population grows and industry and technology advance, this need grows year after year.

According to the 2011 consumption rate, the oil will last 54 years, natural gas 64 years, and coal 112 years (Khattab & Watanabe, 2019). Indeed, the varied technical breakthroughs driven by the use of heavy fossil fuels have improved human existence and made it more comfortable; yet, this comfort has arrived at a significant expense. Global warming and greenhouse gas (GHG) emissions have come from the extensive consumption of fossil fuels. Ozone (O_3), Carbon Dioxide (CO_2), methane (CH_4) and Nitrous oxide (NO_3) are the main greenhouse gases that emit and absorb infrared radiation owing to their unique characteristics and chemical makeup. The elevated level of these gases in the atmosphere had several negative consequences for the planet. Roughly 98% of the greenhouse gases released into the atmosphere are a direct consequence of the production of fossil fuels (Dahman, Syed, Begum, Roy, & Mohtasebi, 2019; Khattab & Watanabe, 2019). The *Mauna Loa* research center revealed CO_2 levels of 413 ppm in March 2019, up from 280 ppm in preindustrial Period. The proportion of atmospheric CO_2 buildup has escalated to 2.28 ppm per year between 2008 and 2017, up from 0.8 ppm per year between 1960 and 1969. The CO_2 content in the atmosphere has increased by 43% since 1750, and as a consequence of this rise, the average surface temperature of the earth has increased by 0.85°C since pre-industrial times (Raud et al., 2019). Each of these elements has shifted the phenomena of global warming from a local myth to a grave concern worldwide that concerns our own humankind's survival on our planet. Because of the continued and increasing release of greenhouse gases, the average temperature of the Earth has been steadily rising. Changes in climate, weather system disruption, glacier retreat, rising sea level, coastal flooding, associated biodiversity loss, and human health effects are the main consequences of fossil fuel consumption (Dahman, Dignan, et al., 2019; Dahman, Syed, et al., 2019). All these collectively coupled with the climb in the energy consumption and demands, depletion of fossil fuels, and severe environmental concerns have sparked to watch out for an alternative, sustainable, renewable, and green energy source that could not only meet the global demand and also helps to lessen the global greenhouse emissions (Agbor, Cicek, Sparling, Berlin, & Levin, 2011; Raud et al., 2019). In this chapter, the focus will be on research into the types, compositions, and application of various forms of biomass accessible for biofuel generation and also the numerous pretreatment and processing options that may be used to various bio-wastes to transform them into useable biofuels cost-effectively and sustainably to fulfill rising energy demand.

NECESSITY OF BIOFUELS

Changes in climate and security of energy supply should be at the forefront of the States international agenda, impacting societal, economical, and political choices. Every country's primary goal should be to find a renewable, cost-effective, biodegradable, and environmentally benign alternative energy source. Biofuels, without a doubt, would be a significant alternative source in which biomass-based biofuels might ameliorate global warming and reduce CO_2 emissions owing to the preceding consumption of this gas by the biomass during photosynthesis, resulting in carbon-neutral emission (Coyle, 2007; Sindhu et al., 2019). The term 'biofuel' refers to any liquid, gas, or solid fuel predominantly produced from a renewable biomass feedstock. Bioethanol, biomethanol, biosynthetic gas (biosyngas), biodiesel, biogas (biomethane), biochar, bio-oil, biohydrogen, and FischerTropsch produced liquids are the common biofuels (Ali, Saleem, Khan, & Watson, 2019; Ayhan Demirbas, 2008). Mankind has been consuming biofuels for an extended time, ever since humans began burning firewood for various home and domestic needs. Biofuels can play an significant role in the future by addressing the enormous fuel market and ensuring global energy security (Kumar et al., 2020). Biofuels offer several benefits over fossil fuels, including renewable, sustainable, abundant availability, biodegradability, CO_2/GHG (greenhouse gas) neutrality, minimal or zero SO_x emissions, reduced NO_x emissions, and the ability to be generated locally and in a safer manner. Biofuels also have several advantages, including the consumption of local resources, the stimulation of rural agricultural development and investment, the reduction of energy dependence on imports, the creation of jobs, the support of rural economic development, and the improvement of local livelihoods (Ruan et al., 2019). Biofuels are regarded as the most essential sustainable fuel resource due to the benefits outlined above. They also contribute to the lessening of greenhouse emissions and, as a result, to the improvement of environmental health. As a result, many governments have set various goals and regulations to encourage and expand the biofuel business and so use energy resources. It is estimated that diverse biofuels will account for 30% of world energy demand (Guo, Song, & Buhain, 2015).

BIOFUEL FACTS, FIGURES, AND POLICIES

The Center for Strategic and International Studies in its report 'International Energy Outlook 2011' stated that renewables are the fastest-growing energy source. It is rising at a rate of 2.8% per year and would arrive at roughly 15% of the world energy market by 2035. It also stated that by 2035, liquid biofuels will include 29% of world energy consumption. This translates to about 5 million barrels per day of the total production (Dahman, Syed, et al., 2019). Governments of different nations have made biofuel policies in current years for the domestic production and usage of biofuels. Brazil has been extremely doing well in biofuel policy that mandates the minimum level of blending of ethanol with petrol. As of today, it is projected that the petrol sold in Brazil contains almost 20 -25% of ethanol in terms of volume (Lamers, Hamelinck, Junginger, & Faaij, 2011). In the USA, the US Energy Independence and Security Act of 2007 have laid down a aim of production of 15 billion gallons of corn ethanol by 2015, and by this year, 21 billion gallons of cellulosic and advanced biofuels (Iens & Argione, 2011). Similarly to these countries, all other big nations, including China, Canada, India, Japan, and South Africa, have legislated biofuel policies that mandated the targets of biofuel blending requirements in fossil fuels, as well as other policies and schemes that encourage the arrangement and commercial biofuel production (Dahman, Syed, et al., 2019; Timilsina, Mevel, & Shrestha, 2011).

INDIA AMONG THE OTHERS

India, a country with over a billion people and limited space, has one of the world's fastest-expanding economies. Energy is critical to the country's socio-economic growth. India is primarily reliant on fossil fuels to fulfill its energy requirements. India has relatively limited fossil fuel supplies and must import oil, coal, and gas, with oil import dependency being particularly severe. To fulfill the rising energy demand, the Indian government is urgently seeking an alternative to fossil fuels. The 2009 'National Policy on Biofuels' envisions biofuels as a vital tool of stimulating rural development and creating local job possibilities. In actuality, India's biofuel business is still in its infancy. India's biofuel production amounts to less than 1% of world output. Within the different renewable energy sources accessible, India has a plethora of bioenergy choices that have been employed to fulfill cooking needs for a long time. Various bioenergy policies and initiatives have been implemented in India in recent years to boost bioenergy production. However, due to policy limitations, the government is unable to fully use the enormous potential of bioenergy solutions. Bioenergy policy implementation is fraught with difficulties in terms of technological, institutional, financial, environmental, and social factors. However, the objective for mixing gasoline with ethanol was around 5%.Currently, bio-ethanol from sugar cane molasses and biodiesel from non-edible oilseed crops such as Jatropha (*Jatropha curcas*) and Pongamia (*Millettia pinnata*) are being encouraged for commercial usage in India (Gopinathan & Sudhakaran, 2009; Kothari et al., 2020; Roy & Chandra, 2019).

Agriculture is the basis of India's GDP, bringing subsistence to 60% of the population, and generating a considerable amount of agro waste as a result of agricultural strength. It is also the second-largest producer of sugarcane following Brazil (Ravindranath et al., 2005). India generates 686 million tons of gross agricultural residue biomass per year, with 234 million tons (34%) accessible as an excess for biofuel energy production. Biomasses from agriculture are used as feedstock in agro-industries (Naik, Goud, Rout, & Dalai, 2010). Residues and by-products from agriculture include rice husks, cottonseed, cereal straw, corn cobs, cotton stalks, various grasses, maize, sorghum stover, sunflower seed hulls, peanut shells, , and wood sawdust and chips, to name a few (Lal, 2008).

CLASSIFICATION OF BIOFUELS

Biofuels can be classified in different ways which are based on different aspects like production process, commercialization stages, physical state, and biomass. This chapter will focus on research into the types, compositions, and applications of various forms of biomass accessible for biofuel generation. The emphasis was on the numerous pretreatment and processing options that may be used to various bio-wastes to transform them into useable biofuels cost-effectively and sustainably to fulfill rising energy demand.

Biofuels are fuels that are produced by biological processes from various sources like plants, crops, agriculture residues. Based on the production route, biofuels can be categorized as primary biofuels and secondary biofuels. Primary biofuels are made up of a variety of materials such as wood chips, pellets, fuel wood, and organic materials that are burnt straight to provide energy for food preparation, heating, and power generation. Secondary biofuels are made from a wide range of biomass and may be utilized for transportation, energy generation, and a number of industrial purposes. Ethanol, diesel, and biogas are examples of secondary biofuels (Dahman, Syed, et al., 2019; Datta, Hossain, & Roy, 2019; Ruan et al., 2019).

IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Biofuels are categorized into conventional and advanced biofuels based on the level of commercialization of technology. Bioethanol made from sugar and starch, biodiesel made from transesterification, and anaerobic digesting methane is all examples of conventional biofuels. Sugarcane and sugar beet, corn, wheat, vegetable oil, animal fat, recovered household fat, waste frying oil, etc., are the most used feedstocks for conventional biofuels. All of these things are sold in different countries throughout the world. Hydrotreated vegetable oil, cellulosic (lignocellulosic) bioethanol, biomass-to-liquid (BtL) biodiesel, microalgae biodiesel, and biohydrogen are examples of advanced biofuels. All these are not yet commercialized. They are in different phases (research and development, demonstration, or early commercial stages) to be commercialized (Awogbemi, Von Kallon, Onuh, & Aigbodion, 2021; Ruan et al., 2019).

Based on the physical state the biofuels can be segregated into three types - solid, liquid, and gaseous biofuels. Different biofuels, their benefits, and drawbacks have been discussed in the following section.

Solid Biofuels

Solid biofuels are raw solid feedstock used to produce biofuels such as wood, wood chips, wood pellets, and charcoal. Lignocellulosic biomass and numerous forms of solid waste are examples of solid biomass. They can be utilized directly as biofuel or transformed into other types of biofuel over various methods. Wood was utilized for numerous domestic uses such as cooking and heating in the early nineteenth century, and it is still the major fuel today. Wood chips are little fragments of wood that have been chipped from tree trunks or branches and used as fuel for heating and energy generating. Similarly, wood pellets are created by grinding wood pieces with sawdust and compressing them via a pelletizer, and they may be utilized as a fuel in household heating and energy generation (Goyal, Seal, & Saxena, 2008; Guo et al., 2015; Sindhu et al., 2019). In the lack of air, biochar, as well identified as charcoal, is a porous, carbon-enriched greyish black solid generated via torrefaction, gasification, hydrothermal carbonization, and other processes that may reach temperatures over 400°C (usually between 300°C and 900°C). It offers an advantage over other raw feedstocks like firewood, wood chips, and so on in terms of lower combustion emissions and higher energy content (Glaser, Haumaier, Guggenberger, & Zech, 2001; Kwapinski et al., 2010). Biochar can be utilized as a solid fuel in boilers, as a feedstock for subsequent gasification processes, to produce activated carbon, and so on (Kambo & Dutta, 2015).

Liquid Biofuels

Bioethanol, biodiesel, Bio-methanol, Biobutanol, and Biooil are examples of liquid biofuels. They're becoming increasingly popular because to the fact that they're highly flammable, have a high energy-to-mass ratio, and are simple to carry.

Bioethanol

The most often employed liquid biofuel in our day is ethyl alcohol, which has the chemical formula CH_3 - CH_2 - OH and is manufactured by the microbial fermentation of sugars or starch using a range of feedstocks. The United States (from maize) and Brazil (from sugar cane) are the world's leading producers of bioethanol, accounting for almost 90% of worldwide output (Cheng & Timilsina, 2011; Vohra, Manwar, Manmode, Padgilwar, & Patil, 2014). It possesses 35% oxygen and therefore can minimize automotive emissions and may be utilized in the same way as conventional fuels. However, they have

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

a poor volume energy density and need more bioethanol per kilometer than gasoline. As a result, it is mixed with gasoline in various ratios ranging from 5% to 25% ethanol and 95% to 75% gasoline and may be used in automobiles without any modifications (Naik et al., 2010; Vohra et al., 2014).

Biobutanol

Biobutanol, C4 alcohol with molecular formula C_4H_9OH, a biofuel made from the ABE (Acetone Butanol and Ethanol) fermentation of the traditional feedstock. It was produced via Clostridium acetobutylicum fermentation of corn and molasses, with the end products being acetone, butanol, and ethanol, and therefore the procedure was designated as ABE fermentation. Byproducts of ABE fermentation include acetic, lactic, propionic, butyric acids, hydrogen, isopropanol, CO_2, and lipids. Biobutanol has greater energy density, is less corrosive than ethanol, safer to use, and has no need for engine modifications as it uses a fuel to air ratio closer to gasoline. Nevertheless, butanol becomes lethal once its concentration reaches 13g/L in the fermentation medium. As a result, much research is being done to genetically enhance butanol-producing cultures that can withstand elevated acetone butanol concentrations of 20.0 to 30.0 g/L while simultaneously recovering the products (Dürre, 2007; Kolesinska et al., 2019; Xue & Cheng, 2019).

Biodiesel

Biodiesel is a colorless to yellowish fuel that resembles conventional diesel. It is a combination of long-chain fatty acid methyl esters (FAME) synthesized in the presence of alcohol and alkaline catalysts from animal fats, edible and non-edible vegetable oil, waste or recycled oil, waste grease and also from algal. Unlike petroleum diesel, which only includes hydrocarbons, biodiesel contains carbon, hydrogen, and oxygen. It has a high flash point, making it harmless to store, handle, and transport, as well as a higher cetane number, indicating that it has greater ignition quality, a low sulfur content, and is biodegradable (Atabani et al., 2012; Hoekman, Broch, Robbins, Ceniceros, & Natarajan, 2012; Ma & Hanna, 1999; V. K. Mishra & Goswami, 2018). It does, however, have a low calorific value, a high pour point (meaning it solidifies at lower temperatures), and high viscosity. As a result, it may be mixed with normal crude oil or petroleum diesel and utilized. The most common biodiesel blends are B2 (2% biodiesel and 98% normal diesel), B5 (5% biodiesel and 95% regular gasoline), and B20 (20% biodiesel and 80% regular diesel) (Morone & Cottoni, 2016).

Biooil

Biooil is a dark, free-flowing organic liquid having a smoky odor which is a mixture of aldehydes, acids, alkenes, aromatics, alcohols, esters, ketones, phenols, oligomers, furans, sugars, guaiacols, syringols, and nitrogen compounds produced by the depolymerization or fragmentation of biomass by fast/slow pyrolysis and thermal liquefaction. Pyrolysis is a practice to heat the plant biomass at 300–900°C in the absence of air. They are also referred to as pyrolysis liquid, pyrolysis oil, wood oil, bio-crude oil, wood distillate, wood liquid, etc.,(Czernik & Bridgwater, 2004). The major disadvantages of bio-oil are high water content, which is a result of the presence of water in the feedstock and also the production of water in the dehydration reactions in the pyrolysis process, high viscosity, less oxygen, low energy density, immiscible with hydrocarbon fuels and corrosiveness which made the bio-oil cannot be used as a

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

transportation fuel. The major challenge preventing the commercialization of bio-oil is the high production cost. Research and development efforts have to be made to reduce the water content, high acidity and further improve the quality of the fuel by pretreatment of raw feedstocks, optimization of operation conditions, adopting strategies such as hydrotreating, hydrocracking, supercritical fluids, solvent addition/esterification and steam reforming (D. Vamvuka, 2011; Guo et al., 2015; Xiu & Shahbazi, 2012).

Gas Biofuels

The third type of biofuels, the gaseous biofuels includes biogas, biohydrogen, biosyn gas, etc., generally have advantages like more reactive, the requirement of fewer oxidants, simple reactors, and low wastage in the yields.

Bio Hydrogen

It is a colorless, odorless, and lightest combustible gas produced from renewable sources that include crop residues, energy crops, agriculture residues, livestock residues, algal biomass, industrial wastes, etc., by either thermochemical conversion or biological conversion. Thermochemical transformation comprises water and biomass thermochemical decomposition, syngas water-gas shift reaction, natural gas (or methane) steam reforming, pyrolysis bio-oil steam reforming, and so on(H. Balat & Kirtay, 2010; M. Balat & Balat, 2009). Biophotolysis is the initial phase in biological conversion technology, which involves using photosynthetic bacteria to convert CO_2 and water into H_2 or photo heterophilic microbes to convert carbohydrates or organic acids into H_2 and CO_2.Following that, photofermentative bacteria photo-decompose organic compounds, followed by dark fermentation, which generates H_2 utilising anaerobic or facultative anaerobic bacteria, and ultimately, microbial electrolysis transforms electron equivalents in organic compounds to H_2 by uniting microbial metabolism with bioelectrochemical reactions in a microbial electrolysis cell. There are practical encounters that have to be addressed like light dependency in the biophotolysis and photofermentation steps, the buildup of acidogenic by-products that may constrain the dark fermentation step, and cell lysis in the electrolysis step (A. Demirbas, 2008a; Meramo-Hurtado, Puello, & Cabarcas, 2020; Vendruscolo, 2014).

Biogas

Biogas also termed biomethane is a gas biofuel that is made by anaerobic digestion of organic wastes like plant residues into smaller molecules in natural environments by the consortium of microorganisms which usually contain 60–65% of methane (CH_4), 30–35% of CO_2, and a small percentage of water vapor, H_2 andH_2S (Ge, Xu, & Li, 2016; Martínez-Gutiérrez, 2018). The purification step is necessary to remove the moisture, CO_2, H_2S, and other impurities before supplying as a natural gas substitute. Because of the presence of higher CO_2 content, it produces lower energy than natural gas. Anaerobic digestion has been employed to manage waste and generate energy by various livestock farms, wastewater treatment plants, and private residences. It is also applied to generate energy and bio-based compressed natural gas (CNG) that is applied to power natural gas cars (Guo et al., 2015; Wei, 2016).

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Syngas

Syngas is a gaseous biofuel which is the result of gasification or pyrolysis of carbon-rich materials such as natural gas, petroleum, coal, and dry plant biomass and it contains CO_2,CO, N_2, H_2, and hydrocarbons (e.g., CH_4, C_2H_4, and C_2H_6) and very minor quantities of moisture, H_2S,NH_3, and tars(Yan, Luo, Hu, Xiao, & Cheng, 2010; Y. Zhang, Zhao, Gao, Li, & Huang, 2015). The main plus of the syngas is versatility as they can be used as starting material to synthesize transportation fuels like methanol, methane, ethanol, dimethylether, and extra products via the gas-liquid platform. Because of stringent feedstock requirements, biomass-based biogas gasification is currently in the early demonstration phases and additional research is needed to know the economics of biomass and attain the financial feasibility for commercial-scale production (Ruiz, Juárez, Morales, Muñoz, & Mendívil, 2013).

BASED ON FEEDSTOCK SOURCES

Based on the different types of feedstocks the biofuels can be divided into first and second-generation biofuels.

First-generation biofuels

First-generation biofuels, often stated to as conventional biofuels, are derived mostly from food crops for instance cereals, sugar cane, tuber crops, sugar beets, and oil crops. The first generation of biofuels covers biodiesel, vegetable oils, biogas, bio alcohols, biomethanol, and Syngas (Ruan et al., 2019).There are over 350 oil-containing crops classified for biodiesel production. Many countries generate first-generation biofuel from a variety of sources (Hirani, Javed, Asif, Basu, & Kumar, 2018). Brazil produces bioethanol mostly from sugarcane, whereas the United States, Canada, and Europe generate bioethanol primarily from maize, wheat, sugar beet, and sorghum, respectively. Maize accounts for approximately 67% of worldwide bioethanol output (Mohapatra et al., 2019).From 2001 to 2017, a large increase in the global production of bioethanol was observed. In 2001, the production was 4874 million gallons which reached up to 27,737 million gallons in 2017 (Mohapatra et al., 2019). Globally, 40-billion-liter bioethanol is produced by the US and 2 billion liters by Canada from corn or wheat. In the case of Brazil, they produce 25 billion liter bioethanol from sugarcane whereas China produces 3 billion liters from corn, cassava. From wheat, sugarcane, and sugar beet, France and Germany produce 1 billion liters and 750 million liter bioethanol respectively. India supplies 1 billion liters of bioethanol from sugarcane and molasses and Australia produces 500 million liters from sugarcane (Mohapatra et al., 2019).

The production of biodiesel in the United States, France, Germany, and Italy is mostly dependent on rapeseed oil and soyabean oil. Brazil mostly employs soybean oil in the manufacturing of biodiesel (Hoekman et al., 2012). It was reported that annual biodiesel production is increasing exponentially. Approximately 85% of biodiesel is produced by European countries (Atabani et al., 2012; V. K. Mishra & Goswami, 2018). The production of biodiesel is increasing by the year. They are produced from oil of soybean, sunflower, canola, or palm oil. Due to their environmental benefits, they are widely used (https://www.mdpi.com/1996-1073/11/12/3366/html). The production was 0.8 billion L in 2000, which reached 4 billion L in 2005. A four-fold increase in production was seen in 2010. By 2012, the production reached over 22.5 billion liters. European countries are the largest producer of biodiesel consisting

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

of 80% of global production, followed by the USA (Hirani et al., 2018). In 2001, the Republic of China started the production of bioethanol using corn. By 2007, they started using grain-based feedstock producing about 1.4 million metric tons of bioethanol, which got replaced by nonfood crops like cassava and sorghum (Mussatto et al., 2010). Thailand started bioethanol production using cassava and cane molasses (Silalertruksa & Gheewala, 2009). The pros and cons of the first-generation biofuels were given in Table 1.

Table 1. Pros and Cons of First-generation biofuels (Datta et al., 2019; Ruan et al., 2019)

Pros	Cons
Sustainable **Renewable form of energy** **Feedstock production is simple using current resources and infrastructure** **Environmental and social advantages** **A huge number of feedstocks are accessible**	**Requires a huge amount of fertilizer, water, and availability of land, lowering the overall energy ratio.** **Added to increased food prices due to equal demand with food.** **Could potentially have negative influence on biodiversity** **Increased carbon footprint compared to other generations of biofuel** **Merging with conventional energy sources** **Compete for the availability of lands**

Sugar containing feedstocks

Sugar containing feedstocks for the generation of biofuels are sugarcane, sugar beet, and sweet sorghum with yields of 62–74 tons/ha, 54–111 tons/ha, and 50–62 tons/ha, respectively which are grown mainly in Brazil, Germany, France, and India. In comparison to maize and wheat, sugarcane remains the biggest provider to bioethanol production and the minimum water user in terms of crop biomass output (Mohapatra et al., 2019).

Sugarcane

Sugarcane (*Saccharum officinarum* L.) belongs to the grass family *Poaceae* (Khattab & Watanabe, 2019). Sugarcane is sugar-producing crop, signifying a substantial quantity of cultivated crops in the world which is grown typically in tropical and subtropical areas (Hiloidhari et al., 2019). It is one of the most favorable sources for bioethanol production and is the second most used raw material for the same. It is widely grown in Brazil which accounts for 27% of global production (Bertrand, Vandenberghe, Soccol, Sigoillot, & Faulds, 2016; Mączyńska et al., 2019). The yearly worldwide production of sugarcane is about 1741.3 million tons where Asian countries put in 44% of it and India is the top country in production (Hiloidhari et al., 2020). Sugarcane was preferred for ethanol production owing to its high sucrose juice composition (Bertrand et al., 2016). Bioethanol from sugarcane represents almost 1/3 of total ethanol production in 2010 (Rasool & Hemalatha, 2016). Each ton of sugarcane could yield 740 kg of juice and 260 kg of wet bagasse. Also, when compared to corn ethanol, sugarcane ethanol produces 45% more ethanol per unit of land (Crago, Khanna, Barton, Giuliani, & Amaral, 2010). It is estimated that one ton of sugarcane at the processing center contains 135 kg of sucrose which can produce almost 70L of ethanol (Naqvi & Yan, 2015). Sugarcane is primarily constituted with 12-17 % sugars by wet weight, with 68-72 % moisture (90% sucrose and 10% glucose or fructose) (Ayodele, Alsaffar, & Mustapa,

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

2020). Sugarcane produces directly monomeric sugars which can be directly used for fermentation. Cane juice which can be extracted from the sugarcanes is roughly 95% and the leftover solid residue is called bagasse which is also a potential biomass feedstock and used for steam and electricity generation by burning in boilers (Rasool & Hemalatha, 2016). The sugarcane bagasse and its potential as a feedstock will be studied in the forthcoming sections.

Ethanol production from sugar cane starts with cane storage and cane crushing for juice extraction. In the sugar mills, first, the sugarcane stalks are washed, chopped, and shredded with the help of blades or knives (Naqvi & Yan, 2015). The bioethanol process from sugar cane initiates with the lignin or hemicellulosic fibers pretreatment to release cellulose. Cellulose fibers are depolarized to yield free sugars. The juice is warmed to 115°C and treated with lime and sulfuric acid, resulting in the precipitation of unwanted inorganics. The sugars released are used up to make ethanol from which the ethanol is distilled (Canilha et al., 2012).In annexed plants, crystalline sugar is co-produced along with ethanol. In these plants, sucrose crystals are formed after the juice is concentrated which is removed by centrifugation and this leaves syrup called molasses. Molasses contains 31% sucrose and 15% inverted sugar (Jayus, Nurhayati, Mayzuhroh, Arindhani, & Caroenchai, 2016). Sugar molasses of 25% as a substrate could yield about 32.32 g/L bioethanol by batch fermentation using *Pichia veronae* strain HSC-22 (Hamouda, Nassar, Madian, Abu Amr, & El-Gendy, 2015). Both sugarcane and molasses have to be diluted to adjust the sugar concentration before fermentation which enables the optimal growth conditions for microorganisms with larger yields. This also contains sufficient minerals and organic nutrients making it appropriate for ethanol production by the *S. cerevisiae* (Bertrand et al., 2016). *S. cerevisiae* strain AS2.1190 immobilized on sugar cane pieces was observed in electron microscopy for its yield (77.13 g/l) of bioethanol by 10 batch fermentations (Liang et al., 2008). A typical fermentation process requires 4–12 h per batch. After the run, separation of yeast and distillation is performed to separate ethanol (Saran, Malaviya, & Chaubey, 2019). In a study *S. cerevisiae,* KP096551 was used for enhancing the production of bioethanol using sugar cane molasses as a substrate. The yield of bioethanol was raised to 8.55% (Rasmey, Hassan, Aboseidah, & Abdulwahid, 2018).

Sugar beet

Sugar beets (*Beta vulgaris* L.), the tuber crops are one of the chieffavorable sources of bioethanol production in the EU primarily in Northwest EU. In the EU, 30% of the bioethanol is produced from Sugar beets in 2011 (Bertrand et al., 2016; Marzo, Díaz, Caro, & Blandino, 2019). It is regarded as the most efficient source for ethanol as the yield of ethanol through fermentation ranges from 100 and 120 L per hectare (Panella, 2010).Countries in Asia like China, Japan, India, and Turkey are keen to use Sugar beet for biofuel production. Based on the data from SNSF in France, it was estimated that the average production of sugar beet is 70 tons/hectare, with the sugar content of 17% on the wet basis which gives atypical production of 12 tons of sugar/hectare. Sugar beetroots are made up of about 75% water, 18% sugar (mainly sucrose), and 7% insoluble and soluble materials (Bertrand et al., 2016). It has been observed that water-soluble sugars extracted from 1 kg sugar beet may generate up to 0.07 kg ethanol (Šantek, Gwehenberger, Šantek, Narodoslawsky, & Horvat, 2010). Sucrose is the chief sugar present and maltose; fructose and glucose are in lesser quantities. Conventional sugar beetroots are used to generate sugar and for biofuel production, specialized non-grade varieties bred are used for total sugar production. The Beet tops have feed value but are usually left in the field at harvest and they constitute 4.6 -7.5 tons per hectare (Panella, 2010).

Ethanol production from sugar beets begins with washing the roots, followed by cutting them into thin strips for better extraction of sugar in a root cutter. Washing is usually done using pre-washing drums, jet washers (Šantek et al., 2010).Then the cut pieces are transported to a diffusion step where sugars are extracted by hot water by a process called counter-current extraction. This is called diffusion juice, the remains are called Pulp which is further processed by pressing and dewatering which accounts for almost 22-28% of dry mass (Vučurović & Razmovski, 2012). The dehydrated pulp contains 80 to 94% fermentable components (pentosans, pectin's, and cellulose) and only 12 to 16% lignin, crude protein, and mineral substances (Marzo et al., 2019). This also can be utilized as biofuel feedstock like sugarcane bagasse with the developing technologies in biofuel production (Khattab & Watanabe, 2019).The extracted juice also called green juice is used for fermentation by *S. cerevisiae* to produce the ethanol which is recovered by a distillation process (Dodić et al., 2009).The molasses obtained after the sugar extraction process are also approximately 53% of sugar and can be used for bioethanol production (Vučurović & Razmovski, 2012). However, the major drawbacks of ethanol from sugar beetroots are storage and production costs (Panella, 2010).Utilization of molasses and pulp also for biofuel production, developing new breeds, and performing anaerobic fermentation to yield biomethane have to be evaluated to decrease the production costs. Different countries have integrated sugar beet in the bioethanol policies for its high sugar content and it does not vie with food (Rulli, Bellomi, Cazzoli, De Carolis, & D'Odorico, 2016). A flocculating yeast strain, *Saccharomyces cerevisiae* IR2 was employed for bioethanol production from sugar beet juice. The study concluded that Raw sugar beet juice was shown to be an ideal substrate for ethanol synthesis, requiring neither any pH adjustments nor nitrogen supply (Ogbonna, Mashima, & Tanaka, 2001).

Sweet sorghum

Sweet sorghum (*Sorghum bicolor* L.) Moench, a Graminaceous crop can be used as a promising feedstock for biofuel production because it has a shorter growing cycle. Sorghum is grown on roughly 35 million hectares throughout the world, with a global average grain production of 1.5 t DM/yr (van der Weijde et al., 2013). Sorghum has a superior energy balance than other competitive crops due to its low input needs, flexibility, and extraordinary biological output (Jianliang Yu, XuZhang, & Tan, 2008). Further benefits over other crops comprise a shorter growing period, tolerance towards drought, and can be grown in colder regions and temperate zones unlike sugarcane (tropical and subtropical areas) and sugar beet (temperate climate) (Wortmann et al., 2010). All the plant parts - grains, stalk juice, and plant biomass can be used for biofuel production. The average productivity is 49.7 tons per hectare which produces roughly 63 % of juice. The juices of Sweet sorghum stalks have sugars (6% fructose , 85% sucrose and 9% glucose), invertase enzyme, and other compounds and impurities (Bertrand et al., 2016). The occurrence of the reducing sugars and invertase enzyme makes the juice unsuitable to sugar production rather it makes it suitable to produce ethanol (Ratnavathi, Chakravarthy, Komala, Chavan, & Patil, 2011).

Ethanol production begins with crushing the stalks for juice which leaves out the bagasse that is usually rich in cellulose, hemicellulose, and lignin (Quintero, Montoya, Sánchez, Giraldo, & Cardona, 2008). Fresh juice is sterilized by heating up to 100^{o}C and then purified by adding lime milk and precipitation by CO_2 (Bertrand et al., 2016). The settled solids are filtered from the juice and purified juice is acquired which is now called thin juice. This can be sent for fermentation after regulating the sugar concentration to 16-18 % which usually contains glucose, fructose, and sucrose (Ratnavathi CV, 2017). *S. cerevisiae* then converts the juice or syrup into ethanol. Sugar is converted to ethanol and CO_2, with minor end products such as glycerol, fuel oils, aldehydes, and ketones being produced in lower amounts.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

After that, it is distilled and concentrated by dehydration to produce ethanol (Ratnavathi et al., 2011). Distillation purifies the ethanol generated in the fermented mash, yielding 95 percent pure ethanol, which is then dehydrated to obtain 99% purity (Ramesh C. Ray & Chandrasekaran Trilokesh, 2019). Enzymatic hydrolysis of the sorghum grains has been reported, as *S. cerevisiae* cannot break down starch which is the primary component in sorghum grains, a combination of enzymes like α-amylase and amyloglucosidase are utilized (Ramesh C. Ray & Chandrasekaran Trilokesh, 2019). The use of sorghum stalks for producing bioethanol was carried out using *S. cerevisiae*. The stalks treated with dilute acids and a total of 20.5% of Bioethanol were revived by this method (Chauhan, Hajare, Mamo, & Madebo, 2021). A comparative study using six different yeast strains, Vin7, SBg, N96, and GSL for production of bioethanol from sweet stem sorghum juice, was carried out in a YEPS medium that consisted of yeast extract, phosphate, and sucrose. Among all the strains Vin7 and SB9 showed higher sugar consuming strain and thereby higher bioethanol yield (87.4%) (Bulawayo, Bvochora, Muzondo, & Zvauya, 1996).

Starch-based feedstocks

The most popular starch-based feedstocks used in bioethanol production include corn, wheat, and tuber crops including cassava, yam, and sweet potato. Starch polysaccharides are broken down into sugars during bioethanol production. Yeasts then turn these carbohydrates into ethanol.

Corn

Corn (*Zea mays*) is the most employed feedstock for first-generation bioethanol production in the United States, because of its high starch content and the conversion of starch to alcohol (ethanol) is relatively easy (Woiciechowski et al., 2016). The corn grows well in temperature 10-30°C. (https://farm-energy.extension.org/corn-for-biofuel-production/). Based on corn variety and its quality, ethanol production varies. The yield of bioethanol is high when kernels are used as it has high starch content (Singh, 2012). The starch in corn kernel has alpha-linked glucose polymer which can be easily broken down to monomers (glucose) and then these glucose molecules are fermented to alcohol using *S. cerevisiae*. It was reported that about 72% of the dry mass of corn kernel contains starch. The amount of hemicellulose/cellulose, Protein, Oil, sugars, and ash present in corn kernels is about 10.5, 9.5, 4.5, 2, and 1.5 % of the dry mass respectively. The moisture content in the corn kernel was found to be 15% (Woiciechowski et al., 2016). In the US mostly 40% of the corn cultivated is used for bioethanol production (Naqvi & Yan, 2015). The ethanol production from corn consists of majorly 5 steps which are raw material pretreatment, hydrolysis, fermentation, separation, and dehydration (Quintero et al., 2008). It was reported that about 500 gallons of ethanol are produced from corn cultivated on oneacre of land. Around 4 tons of corn grains are harvested from one acre of land (Sexton & Zilberman, 2011). Around 3460 - 4020 L per hectare ethanol is produced from corn in Brazil (Kim & Dale, 2004). It was reported that about 2.7 gallons of ethanol can be produced from one bushel of corn and 17 pounds of distillers dried grains (DDG) can be obtained as a co-product. This DDG can be fed to livestock. There are two ways by which the corn is processed, wet milling and dry milling. Wet milling is mainly used for the production of high fructose corn syrups which are used in the food industry. They are used as sweeteners in non-alcoholic beverages and baked products. In dry milling, the corn is mashed, and slurry is prepared by adding a heat-stable enzyme and water. The slurry prepared is then converted into corn mash by adding other enzymes. This corn mash is further used for the fermentation process. After the fermentation, the distillation of the

IP Address: 223.238.231.239

liquid part is done to get pure ethanol and the remaining part is centrifuged. The solid material is DDG and is further used (Martin, 2010).

Cassava

Cassava (*Manihot esculenta*) is a shrub and a tuber crop. 25-35% starch is present in the roots and tubers of cassava, sweet potato. Bioethanol production from tubers is more cost-effective than that from grains. About 281 million tons of cassava is produced globally. Out of Asian countries, Thailand and Indonesia produce about 26 million tons and 28 million tons of cassava. Around 77-94% of starch and 59-70% of the moisture is present in cassava (Woiciechowski et al., 2016). Mainly China and Thailand use cassava for bioethanol production due to their obtainability all through the year (Mohapatra et al., 2019). Cassava roots have a 30% of starch content by which 180 L of 96% pure ethanol per ton of cassava can be produced (Bertrand et al., 2016). Bioethanol production using cassava is led by Thailand (50%), followed by China (44%). Around 3400-3600L per hectare ethanol is produced from cassava in Brazil (Mohapatra et al., 2019).

Production process from cereal crops

Unlike the sugar crops, the production of bioethanol from the cereal crops is different as the key component in these crops is starch, a macromolecule made of a lengthy polymer of glucose units that can't be turned into ethanol immediately (Mohapatra et al., 2019). Hydrolysis is a crucial step that breaks down the starch molecule into individual glucose monomers. The dry-milling process and wet-milling process are the two major processes used for bio-ethanol production (Naqvi & Yan, 2015). In the dry milling, the corn is washed, crushed, milled, ground into flour, and made into slurry by adding water (Bertrand et al., 2016). The starchy material is gelatinized for the amylose and amylopectin susceptible for enzymes to hydrolyze in the next step (Woiciechowski et al., 2016). The enzymatic hydrolysis of starch has two steps - liquefaction and saccharification (Bertrand et al., 2016) and in the liquefaction step, a heat-stable α-amylase, which hydrolyzes α-1, 4 bonds between glucose units in the stanch molecule randomly, yielding dextrins and gluco-oligosaccharides with reduced starch viscosity. Dextrins are further hydrolyzed by dextrins/pullulanase that hydrolyzes both α-1, 4 and α-1, 6 glycosidic linkages and finally convert to glucose by glucoamylase (Baras, Gacesa, & Pejin, 2002). Gluco-amylases also known as amyloglucanases, attacks starch from the non-reducing end to produce glucose (Nikolov, Meagher, & Reilly, 1989).Wet milling process, consists of an additional step is performed where dilute sulfuric acid is added to the corn to make a slurry and left for 24–48 hrs where the corn grains decompose into different components. The corn starch is then fermented into ethanol (Naqvi & Yan, 2015). In the fermentation step, *S. cerveciae* converts the glucose into ethanol and CO_2 where in, bioethanol is separated from the culture that has 8–11% (w/w) ethanol in the distillation section (Quintero et al., 2008). Few studies were provided in the Table 2 and the general process is mentioned in the Fig 1.

Second-generation biofuels

Second-generation biofuel is also acknowledged as lignocellulosic biofuels are produced from a broad diversity of feedstock which is majorly crop, agricultural, and forest leftovers and are examples of non-edible biomass. These feedstocks are inexpensive, plentiful, and renewable (Lee & Lavoie, 2013; Raud et al., 2019). They are produced in a sustainable way which doesn't impact that much on global CO_2 levels (Naik et al., 2010). Since they are taken from non-food material, a crisis for food is not seen (Hirani et al., 2018). The non-food materials including bagasse, clover, de-oiled seed residues, straw, leaves, grass, and stem biomass are widely used for 2G biofuels. The 2G biofuel mainly includes bioethanol, biodiesel, dimethyl-ether, biosyngas FT (Fischer-Tropsch) biodiesel (Ruan et al., 2019). The production of 2G biofuel can be done by thermochemical route or biochemical route. Unlike first-generation biofuel, 2G biofuel does not need additional water, land, and fertilizers (Dahman, Dignan, et al., 2019). This fuel is combined with other conventional fuels like petroleum-based fuels for combustion. This is applied in internal combustion engines (Datta et al., 2019). Second-generation bioethanol is produced by utilizing cellulose, a glucose polymer feedstock. During the production process, the raw material will undergo pretreatment by physical, chemical, or biological methods (Prachand Shrestha, Anthony L Pometto III, 2012). A wide variety of lignocellulosic biomass is used for the 2G biofuel production which includes agricultural and timber industry residues and co-products, food crop residues, perennial lignocellulosic plants like reed canary grass, *Miscanthus, Eucalyptus* (Ho, Ngo, & Guo, 2014). It was reported that by 2016, about 67 second-generation bioethanol facilities were started throughout the world. The United States is the leading in second-generation biofuel production (Mohapatra et al., 2019). The lignocellulosic biomass contains cellulose, hemicellulose, and lignin. Hemicellulose gets decomposed fast at temperature 200-380°C, cellulose at 320-400°C and lignin is the most stable one and decomposes at above 400°C (J. Zhang & Zhang, 2019). The content of cellulose, hemicellulose, and lignin vary from different types of feedstocks. The biomass that can be used for the production of biofuels can be divided into non-woody and woody biomass. The pros and cons of the second-generation biofuels were given in the Table 3.

Table 3. Pros and Cons of second-generation biofuels (Carriquiry, Du, & Timilsina, 2011; Saini et al., 2015)

Pros	Cons
Minimal feedstock costs **No rivalry with food** **Using the entire plant rather, as well as leftovers, thereby higher energy generation** **Better yield with lesser area** **The percentage of usable feedstocks is higher than is easily available presently** **Environmentally feasible**	**Overuse of agricultural lands eventually may lead to soil erosions** **The process of production is complex.** **Lack of commercially viable technologies** **Advanced research technologies are lesser-known**

Woody based feedstock

Hardwoods and softwoods make up the woody biomass, which is used to make biofuels. The chemical compositions and the physical properties of these materials are different from each other. Based on these

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

ethanol production varies (Wijeyekoon & Vaidya, 2021). Reportedly, the use of wood-based feedstock for bioethanol production can also lower carbon emissions more effectively. Also, the higher the area of production less is the production costs (Perez-Verdin et al., 2009). The utilization of novel non-edible lignocellulosic materials in the creation of chemicals and fuels is a strategic goal. These raw minerals are an intriguing and potential alternative to fossil fuels as a source of energy (García, González Alriols, & Labidi, 2014). Short-rotation woody crops have been marketed as a long-term biofuel feedstock for heat and/or electricity generation. Short rotation woody crops (SRWC) are perennial plants with consistent production and well-developed technique for cultivation (Stolarski et al., 2015). Some of the plants that are used for woody feedstock are Hybrid poplar (*Populus* spp.), Willows (*Salix* spp), the American sycamore (*Plantanus occidentalis*), Sweetgum (*Liquidambar* spp.), Black locust (*Robina pseudocacia*), Silver maple (*Acer saccharinum*), Loblolly Pine (*Pinus taeda*) (García et al., 2014; Stolarski et al., 2015). Mainly the wood material in the plants is made of cellulose microfibrils which are together gripped by hemicellulose and lignin. The vessels and tracheid are present in the center which is surrounded by the microfibril cellulose. Based on this layer the toughness of the wood increases and will undergo various pre-treatment. Combining multiple pretreatments has also been investigated and might be beneficial in achieving appropriate segregation of the various components and better yields (Alvira, Tomás-Pejó, Ballesteros, & Negro, 2010). To not only improve the efficiency of subsequent bio refinery processing stages, but also to avoid high-contaminated hemicellulosic or lignin-containing streams, the correct mixture of pretreatment steps (first, for hemicelluloses solubilization, and then, for effective de-lignification) must be used (Wijeyekoon & Vaidya, 2021). The production of biofuel from woody biomass depends on the feedstocks from both forests and plantations. Lignocellulosic biomass can create 442 billion liters of second-generation ethanol, while total agricultural wastes and discarded crops can yield 491 billion liters of ethanol every year (Kim & Dale, 2004). About 30% of the global forest biomass is produced from the US. For biochemical conversion of sugar to fuels, woody biomass is not preferred because of their high lignin content and recalcitrance to digestion. It was reported that 1.2 million liters of ethanol was produced from 4 million dry tons of wood every year in Mississippi (Perez-Verdin et al., 2009). Owing to the high energy requirement for the conversion, bioethanol production is difficult (Mohapatra et al., 2019).

Non-woody biomass

The other sort of lignocellulosic feedstock that can be well-thought-out for biofuel production is non-woody biomasses which are cheaper, simple to process, and need less energy for the production of bioethanol. They can be sorted out broadly into agriculture residues, process residues, native plants and non-wood plant fibers, solid wastes, etc. which were discussed in the coming topics (García et al., 2014; Mohapatra et al., 2019).

Agriculture residues

Corn stover, Cereal straws, rice husks, etc., are the various agriculture residues that can be utilized as a potential feedstock for biofuel production.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Corn stover

The residues available in the field after the corn grains harvest from the corn plant are usually the cobs, stalks, leaves, husks and tassel are called corn stovers (Liew, Hassim, & Ng, 2014). Globally approximately 377 million tons of corn stover is produced per year whereas the USA is the major source as the USA mainly uses corn ethanol (Hiloidhari et al., 2019; Thompson & Tyner, 2014). It has 37- 61% cellulose (Axelsson et al., 2012), 19.3- 31% of hemicellulose, and 6.9 - 18% of lignin (Ruan et al., 2019). Xylose and arabinose are the predominant five-carbon sugars. Stover is a byproduct of maize production and not a food-based product. In hemicellulose and they too can be fermented to ethanol with the suitable microorganism (Woiciechowski et al., 2016). Development for cost-effective technologies for the biomass conversion into sugars is a need and diverse trials are in progress to extract the sugars for the fermentation process. Some of the studies using corn stover as the substrate to produce biofuel were given in Table 4.

Cereal Straws

A variety of cereal grains have been used as food for humans containing 60-70% starch. They generate enormous quantities of straws as agricultural residues like dry stalks and leaves in the fields following the removal of nutrient grains and seeds. Barley, wheat, rice, oats, and sorghum are all considered essential cereal crops. Different cereal crops such as barley and oat from Europe, sorghum and corn from the United States, and rice and wheat from India and China are predicted to produce 1580.2 million tones every year (Kim & Dale, 2004). All these different cereal straws have 33%–47% cellulose which can be utilized in biofuel production (Tye, Lee, Wan Abdullah, & Leh, 2016). Pyrolysis can be applied to these crop residues which produce biochar. Rice straw was found to be a good potential for biochar as the yield was around 43.8%. Similarly, comparative studies of anaerobic digestion were conducted with goat manure and three crop residues, namely rice straw, corn stalks and wheat straw found better for biogas production (Bian et al., 2016).Table 4 has provided with few studies using various cereal straws for biofuel generation.

Rice husk/hulls

Oryza sativa, commonly called rice is an herbaceous plant that belongs to the Poaceae family. Rice husk (RH) is a major byproduct of the paddy process, accounting for 20–25% of the weight. India is the world's second-biggest rice grower, producing 102.0 MT of rice and around 20.4–33.6 MT of RH per year (Potumarthi, Baadhe, Nayak, & Jetty, 2013).It is a lignocellulosic substance with a low bulk density that contains around 20–25% lignin, 35–40% cellulose, and 15–20% hemicellulose. It has the potential to act as a feedstock for the production of gasoline-ethanol as of its availableness and affordable cost (Jun Yu, Zhang, He, Liu, & Yu, 2009). Various studies using rice husk for biofuel production were given in Table 4.

Process residues

Sugar cane bagasse, Cassava bagasse, Sweet potato residues are the various process residues that can be used as potential feedstock for biofuel production.

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

Sugarcane bagasse

Sugarcane wastes, particularly bagasse (SB) and leaves (SL) have been investigated for biotechnological and non-biotechnological applications. For decades, SB and SL have been studied for use in lignocellulosic bioconversion, allowing for the cost-effective use of residual substrates in the manufacture of bioethanol and value-added commercial goods like as xylitol, specialty enzymes, organic acids, single-cell protein (Chandel, da Silva, Carvalho, & Singh, 2012). The leftover dry matter residue after extraction of juice from sugar cane is termed sugar cane bagasse. The major advantage is its accessibility at the plant site where the juice is extracted. It is composed of 40–45% of cellulose, 27–37.5% of hemicellulose, and 10–20% of lignin (Canilha et al., 2011; Zhao, Peng, Cheng, & Liu, 2009). From a ton of bagasse, 300 L of ethanol can be produced (Woiciechowski et al., 2016). However, it has a higher amount of complex inbuilt structure and where individual sugars aren't accessible for the yeast to produce ethanol and therefore a cost-effective pretreatment has to be done before enzyme hydrolysis to break the polysaccharides into monosaccharides. In the following chapters, we go through the techniques in greater depth. Studies for biofuel production using sugarcane bagasse were provided in Table 4.

Cassava Bagasse

Cassava bagasse is a waste by-product of cassava starch manufacture that is both affordable and widely available. For every 250–300 tons of cassava root processed, roughly 280 tons of bagasse with an 85% moisture content are generated (Pandey et al., 2000). Cassava is a starch based tuber crop produced in many Asian, Africa and Latin American. India also has many cassava processing plants. Cassava bagasse contains 30-35% of carbohydrates which can be employed for biofuel production (Mohapatra et al., 2019). Few studies for biofuel production using cassava bagasse were given in Table 4.

Sweet Potato Residues (SPRs)

The remaining residue after the removal of starch from sweet potatoes is called Sweet Potato Residues (SPRs) contributing for 10% of the total dry matter of sweet potatoes. The annual production of sweet potatoes is about 71 million tons globally which harvests 2 million tons of SPRs. Viscosity was one of the SPRs main drawbacks to utilize as feedstock (Duvernay, Chinn, & Yencho, 2013). Requirements of heavier instruments of corrosion resistance are required which is a major bottleneck. However recent enzymatic methods for utilization of SRPs opened up the opportunities to utilize the same as feedstock (Izmirlioglu & Demirci, 2012). Various studies employing the SRPs were provided in Table 4.

Native Plants

Grasses are indigenous plants that grow naturally and do not require special care, making them a cost-effective biomass source. Carbohydrates and lignin make up the majority of them. These polysaccharides may be broken into sugars and then fermented to produce bioethanol. The most commonly used grass plants are Napier grass, Giant Miscanthus (*Miscanthus* spp.), Switch grass, and Bermuda grass. *Miscanthus* spp. is a perennial sterile grass hybrid that proliferates through rhizomes. It is a type of saw grass that can yield 5 to 8 times as much ethanol per acre as compared to corn. It has high lignocellulosic content, 40%–60% of cellulose, 20%–40% of hemicellulose, and 10%–30% lignin. Numerous species of

IP Address: 223.238.231.239

Miscanthus have diverse carbohydrate and lignin content which can be utilized for biofuel production. They intern help in protecting soil erosion and fixing atmospheric carbon as contrast to other annual crops (Axelsson et al., 2012). *Panicum virgatum* is generally called Switchgrass, a perennial herbaceous grass that is native to North America and requires low requirements like *Miscanthus* (Adler, Sanderson, Boateng, Weimer, & Jung, 2006). It has 37% to 40% of cellulose, 25% to 29% of hemicellulose, and 18% to 25% lignin. This grass has a high net energy benefit and effective soil carbon absorption, making it a good crop for soil conservation on productive land (Mohapatra et al., 2019). The next grass feedstock in the list is *Pennisetum purpureum* commonly called Napier grass a native to eastern and central Africa and has been introduced in tropical and subtropical countries. The plant's significant properties include high cellulosic fiber content, minimal nitrogen fertilizer use, and the ability to grow rapidly, making it an ideal feedstock for biofuel synthesis (Zahran, 1999). The grass has cellulose in the range of 40% to 50%, hemicellulose in the range of 20% to 40%, and lignin in the range of 10% to 25% (Takara & Khanal, 2015). *Conodont dactylon*, termed Bermuda grass, has high carbohydrate content similar to the different grass feedstocks. It has 40%–55% of carbohydrates (cellulose and hemicellulose) and 20%–25% of lignin (Takara & Khanal, 2015). Cocksfoot grass, reed canary grass, big bluestem grass, and alfalfa are in addition other potential grass feedstock that can be considered for biofuel production (Njoku, Uellendahl, & Ahring, 2013). Various studies were provided in Table 4 which provides information regarding their use as substrates for biofuel production.

Natural Non-woody Plant Fibers - Bast crops

Bast crops are highly resourceful mop crops that can grow on waste or even brackish water. Bast fibers are the fibrous plant fiber's outer layer, accounting for one-third of its weight. Some of the Bast fibre crops with high cellulose content and potential as biofuel feedstocks are flax, ramie, kenaf, sun hemp, and industrial hemp (Cherney & Small, 2016). Industrial hemp is considered a vital sustainable potential option for biofuel production as said by European Energy Agency. The global yearly production of hemp is around 0.1 million tons. Industrial hemp has 70.0–90.0% of cellulose and other fibers such as flax, jute, and ramie has 60.0%–80.0%, 51.0%–84.0%, and 68.0%–76.0% of cellulose respectively (SaifulAzry, Amel B. Ahmed, 2011). The biofuel output from industrial hemp and other bast fibre crops, on the other hand, is mostly unknown.

Food processing wastes and Solid wastes

Enormous amounts of different fruits and vegetables are used and processed every day, because of increasing market demand which generates huge quantities of industrial wastes, which include peels, seeds, shells, pomace, skin, etc. from various fruits and vegetables (Hiloidhari et al., 2019). Fruit leftovers such as tomato, asparagus, kiwi, and potato residues may also be employed to produce biofuels by anaerobic digestion (Siciliano, Limonti, Mehariya, Molino, & Calabrò, 2019). Different solid wastes that include a municipal solid waste (paper, plastics, etc.), wastewater sludge, food waste, animal manure, etc., in addition, can be used as a source for biofuel as they have cellulose (Ho et al., 2014). Fruit & vegetable processing sectors have developed massively leading huge amount of industrial wastes generation like leaves or straw, seeds, pulp, or pomace. Up to 60% of citrus peels are generated in citrus fruit processing industries which are a possible substrate for multiple fermentation processes (Wilkins, Suryawati, Maness, & Chrz, 2007). Some of the studies using various wastes were provided in the Table 4.

BIOMASS STRUCTURE AND COMPONENTS

The many varieties of lignocellulosic biomass that are accessible have previously been mentioned in previous topics. Cellulose (30–50%), hemicellulose (25–30%), and lignin (10–35%) make up the majority of lignocellulosic biomass, which is structured into a complex structure. Subject to the biomass type, source, growing circumstances, maturity, and harvest time, these percentages vary (Agbor et al., 2011; McKendry, 2002). In the upcoming sections the different components of lignocellulosic biomass processing procedures, challenges, and recent technological advances in the production of biofuels from these biomasses will be discussed.

Cellulose $(C_6H_{10}O_5)_x$

This is the most abundant polysaccharide in lignocellulosic biomass and the primary component. The essential building component is cellobiose, which is made up of a linear chain of D-glucose monomers connected by β-(1,4)-glycosidic linkages (Himmel et al., 2007). In wood pulp, the number of glucose molecules in a chain can range from 800 to 10,000 units until 17000 units. This is called the degree of polymerization. These linear cellulose chains unite to form tightly packed cellulose fibers via intramolecular and intermolecular hydrogen bonds and van der Waals forces. Because of their ordered packing, these cellulose fibers sequentially form crystalline structures. They are water-insoluble and extremely resistant to depolymerization. The regions of cellulose with less crystalline packing are referred to as amorphous structures (Xuebing Zhao, 2012). Because these regions are less resistant to biodegradation, they may be properly broken to produce sugars via enzymatic hydrolysis and alcoholic fuel (Khattab & Watanabe, 2019; Robak & Balcerek, 2018).

Hemicellulose

Hemicellulose, which is made up of several sugars, is the next most common polymer. It's a polymer made up of short, branched-chain sugars that's heterogeneous. It is composed of two distinct monomeric sugars - Pentoses (C5 sugar) and hexoses (C6 sugars). D-xylose and L-arabinose are pentoses, while d-mannose, d-galactose, and d-glucose are hexoses. Xylan is the most plentiful hemicellulose component of all (Peng, Peng, Xu, & Sun, 2012). All of the pentose and hexose combine to form short, branching structures. They are amorphous and provide hemicellulose the ability to be partially soluble in water. Sugar acids such as uronic acids, as well as monosaccharides, are found in hemicellulose, which contains d-glucuronic, 4-O-methylglucuronic, and d-galacturonic acids. Because of its low molecular weight and simple structure with short lateral chains, hemicellulose is easier to hydrolyze than cellulose. Hemicelluloses in secondary cell walls interfere with cellulose and lignin, which create a network by hydrogen-bonding to cellulose microfibers, covering them, and providing the structural backbone for plant cell walls (Koshijima & Watanabe, 2003; J. X. Sun, Sun, Sun, & Su, 2004). As a result, enzymes have difficulty accessing the sugars in cellulose that can be turned into biofuel. To make the cellulose more digestible, at least half of the hemicellulose must be eliminated by pretreatment procedures (Saha, 2003).

Lignin

Lignin is a 4-hydroxyphenylpropanoid-based aromatic compound found in lignocellulosic biomass. They are known as monolignols or lignin precursors, and they are linked by ether (C-O-C) and carbon-carbon (C-C) bonds with varying degrees of methoxylation. There are three varieties of monolignols: p-coumaroyl, conifineryl alcohol, and sinapyl alcohol, which are derived from the precursor's p-hydrophenyl (H), guaiacyl (G), and syringyl (S). They are connected by various links to form a complex three-dimensional polyphenolic network. Lignin is hydrophobic and defiant to chemical and biological destruction. It is located in the center of the lamella and serves as a binding substance for the cell wall and plant cells. Lignin forms an amorphous mixture with hemicellulose and cellulose fibrils embedded within it and is thus referred to as a 'glue' or binding substance that holds the various components of lignocellulosic biomass together (Boerjan, Ralph, & Baucher, 2003; Ghaffar & Fan, 2013). The successful fragmentation of lignin is a critical step in gaining entry to the polysaccharide's cellulose and hemicellulose for the enzymes to break down and create sugars for bioethanol conversion. Pretreatment procedures in the processing of lignocellulosic biomass can remove lignin, allowing value-added goods such as dyes, insecticides, and industrial plastics to be converted (Dahman, Dignan, et al., 2019).

Conversion technology

Given the variety of biomasses available, it is possible to generate a wide range of biofuel products from the same feedstock. Using thermochemical and biochemical processes, lignocellulosic biomass may be converted into a variety of biofuels as mentioned in Fig 2.

Figure 2. Second-generation biofuel production process

Thermochemical Process

Thermochemical processing, as the name implies, entails the conversion of biomass into a variety of products by thermal decomposition and chemical reformation, and primarily includes heating of the biomass in the presence of varying oxygen concentrations. Combustion, gasification, liquefaction, hydrogenation, and pyrolysis are examples of thermochemical conversion processes (Goyal et al., 2008). The biomass is roasted at low temperatures between 250 to 350°C in the absence of oxygen in this process to form biochar (Glaser et al., 2001; Kwapinski et al., 2010). Pyrolysis is a procedure that changes biomass to biooil by heating it to temperatures ranging from 350–550°C and reaching 750°C in the lack of oxygen (Mohan, Pittman, & Philip, 2017). The biomass undergoes full depolymerization and is transformed largely into syngas, with charcoal and biooils as by-products, in the gasification process, which happens at even higher temperatures ranging from 750 to 1,200°C and with insufficient oxygen supply (Lee & Lavoie, 2013; McKendry, 2002)(J. Zhang & Zhang, 2019).

Biochemical Process

Biochemical pretreatment of biomass employing biological, physical (heat), or chemical catalysts are used in the biochemical process. For the degradation of polysaccharides into simple sugars, biocatalysts such as enzymes are used, and fermentative microorganisms (yeast or bacteria) are used for fermentation, where the sugars are transformed into biofuel. Each method of biomass conversion has its own set of obstacles and opportunities. The biochemical route is thought to be more environmentally friendly, practical, and cost-effective. The biochemical method is limited to the conversion of polysaccharides, but the thermochemical approach is more widely used nowadays since it can convert all of the organic constituents of biomass into various biofuels (Robak & Balcerek, 2018; Vohra et al., 2014). Further to this section onwards, the focus will be on the conversion processes for lignocellulosic biomass via biochemical methods.

Pretreatment

Lignin holds together an intricate network of polysaccharides, cellulose, and hemicellulose in lignocellulosic biomass. The removal of lignin from the lignocellulosic biomass would be the first step in the conversion process, allowing the polysaccharides to be obtained. The pretreatment stage is an important part of the biothermal conversion process. The pretreatment phase should be able to create highly digestible solids, avoid degradation of cellulose and hemicellulose, avoid inhibitor development in subsequent processes, and easily recover lignin. The pretreatment process is influenced by factors such as biomass crystallinity, degree of polymerization (DP), surface area accessibility, hemicellulose, and lignin concentration (Cheng & Timilsina, 2011; A. Mishra & Ghosh, 2017).

Various categories of pretreatment procedures have been employed, which possibly divided into three categories: physical, chemical, and biological. Among the three primary processes in biofuel production, the pretreatment step appears to have the greatest capital and operational costs. In the bioethanol manufacturing process, the pretreatment stage accounts for 40% of the processing expenses. As a result, it's critical to pick the best technique that's both cost-effective and successful at removing lignin (Naik et al., 2010; Robak & Balcerek, 2018; Saini et al., 2015).

Physical methods like mechanical pretreatment enable us to accomplish higher hydrolysis efficiency. Chipping, grinding, and milling are examples of techniques that may be used to enhance surface area, minimize biomass chip size, and lower the degree of polymerization and crystallinity of cellulose. These methods are regularly combined with other methods. Following chipping, milling, or grinding, the particle size is condensed to 10–30 mm and 0.2–2 mm, respectively, depending on the kind of physical pretreatment used. Two types of milling are being practiced -ball milling and wet disc milling. The most major disadvantage of milling is a large amount of energy requirement (Hideno et al., 2009; Inoue, Yano, Endo, Sakaki, & Sawayama, 2008). Wet disc milling has been shown to reduce energy consumption when compared to other milling pretreatment methods, but ball milling has been shown to produce elevated glucose and xylose yields after enzymatic hydrolysis (Da Silva, Inoue, Endo, Yano, & Bon, 2010). Extrusion pretreatment is a type of thermophysical method where the materials are subjected to different processes like mixing, heating, and shearing which disrupts the (X. Chen et al., 2014; Wahid, Hjorth, Kristensen, & Møller, 2015). Microwave irradiation is a physical pretreatment method that degrades and partially eliminates lignin and hemicellulose and modifies the cellulose structure and thus increases the enzymatic susceptibility. It is based on the direct application of electromagnetic radiation to a substance (for example, an organic solvent or plant tissue) that can absorb and convert electromagnetic energy (microwaves) into heat (Ganzler, K., Salgó, A., & Valkó, 2012; Hu & Wen, 2008).

In chemical procedures, acids, alkaline agents, organic solvents, ionic liquids, and other chemicals can be employed to break apart the lignocellulosic structures. However, this approach has a number of drawbacks, including the creation of hazardous substances, carbohydrate loss, and the high cost of chemicals employed in the process (Haghighi Mood et al., 2013). Acid hydrolysis is the most popular chemical approach for biomass pretreatment, in which the acid decomposes lignin and hydrolyzes hemicellulose into monosaccharides, allowing for easier access to cellulose for enzymatic hydrolysis. Concentrated acid (72% H_2SO_4) used at low temperature or dilute acid (2–5% H_2SO_4) applied at high temperature can do this. Other than sulphuric acid, other acids also were in use like H_3PO_4 (Hong, Xue, Weng, & Guo, 2012). H_2SO_4 and H_3PO_4 are generally inexpensive and effective at hydrolyzing lignocellulose. Similarly, Hydrochloric acid (HCl) is more volatile and simpler to recover than sulfuric acid (H_2SO_4), and it destroys biomass more effectively (A. Demirbas, 2008b). Nitric acid (HNO_3) has a high rate of cellulose to sugar conversion (Tutt, Kikas, & Olt, 2012). Both acids, however, are more costly than sulphuric acid. However, the primary disadvantages of using concentrated acid are its toxicity and corrosiveness, as well as the cost of acid recovery and the production of fermentation inhibitors, whereas the main disadvantage of using dilute acid is the need for more energy (Arora, Sharma, Kumar, & Sani, 2019). Similarly, alkali treatment includes the use of sodium (NaOH) (Wang, Keshwani, Redding, & Cheng, 2010), potassium (KOH) (Hendriks & Zeeman, 2009), calcium ($CaOH_2$) (Xu & Cheng, 2011), that can break the bonds between lignin and carbohydrates and increases the accessibility of the cellulose for enzyme hydrolysis. It is more beneficial as the lignin and hemicellulose are removed efficiently and also increase the surface area for the enzymes to hydrolyze better. Alkaline pretreatment, alternatively, is carried out at lower temperatures and does not necessitate the use of sophisticated reactors, making it more suitable for use on-farm. Long residence times (from hours to days) and the necessity to neutralize the pretreated slurry are the key disadvantages (Haghighi Mood et al., 2013). A new approach for the pretreatment is the use of chemicals as solvents like methanol, ethanol, or acetone in grouping with acid or base catalyst which can help in the disruption of the lignocellulose structure and increase the accessibility for cellulose fibers. This approach is termed Organosolv pretreatment. The catalysts used consist of organic or inorganic acids (hydrochloric and sulfuric acids), bases (ammonia, sodium

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

hydroxide, and lime) (Araque et al., 2008; Mesa et al., 2011; F. Sun & Chen, 2008). Though lignin and hemicellulose are removed efficiently, the high cost of the solvents, flammability, and volatility are the drawbacks (Araque et al., 2008).

A different latest physio-chemical pretreatment technique is the use of ionic liquids (IL) which are the organic salts composed of large organic cations and small inorganic anions which can notably break the lignocellulosic structure by breaking the bonds between cellulose, hemicellulose, and lignin. IL's are a novel category of solvents that are completely made up of ions and have low melting points (b100°C), high polarities, great thermal stabilities, and minimal vapor pressure (cations and anions) (Peter Wasserscheid; Wilhelm Keim, 2010). The imidazolium cation, which may couple with anions such as acetate, bromide, chloride, sulfate, nitrate, methanoate, and triflate, is present in the most prevalent forms. A suggested approach of dissolution implies that these ionic liquids fight for hydrogen bonding with lignocellulosic components, destroying their three-dimensional network (Moulthrop, Swatloski, Moyna, & Rogers, 2005). They have the benefit of simultaneously dissolving carbohydrates and lignin, which might open up new processing options for lignocellulosic feedstocks. Though its significant potential for improving cellulosic biomass digestibility, ILs are still in the research stage, and issues such as the high cost of the stage of chemicals must be examined for commercial usage (Miyafuji, 2015). Steam explosion or also called Steam pretreatment (SP) is a physio-chemical pretreatment process in which the biomass's lignin and hemicellulose are divided up by steam heating (Thermo), shearing owing to abrupt decompression and extension of moisture (mechano), and glycosidic bond degradation (chemical). SP may be efficiently increased by using H_2SO_4 (Wen Hua Chen, Pen, Yu, & Hwang, 2011) or SO_2 (Mackie, Brownell, West, & Saddler, 1985) as a catalyst. The use of an acid catalyst improves hemicellulose sugar recovery, lowers inhibitory compound generation, and improves enzymatic hydrolysis on solid residue. It is an appealing procedure since it uses few chemicals. It uses less energy and has no recycling or environmental costs. However, one of the drawbacks of SP is that it does not destroy the lignin-carbohydrate matrix, which enhances the likelihood of condensation and precipitation of soluble lignin components, making the biomass less digestible (Agbor et al., 2011; Haghighi Mood et al., 2013). Ammonia fiber explosion (AFEX) is a method based on the steam explosion where the ammonia is added with the biomass along with steam. For a limited period (< 30 min), high pressure (1.72–2.06 Mpa) and moderate temperatures (60–120°C) are applied, followed by a quick pressure release. This increases the ease of access of cellulose for enzymatic hydrolysis by partially solubilizing hemicelluloses. The rapid expansion of ammonia gas causes the breakdown of the lignin-carbohydrate complex and disruption of biomass fibers, leading to improved digestibility of biomass (Shishir P.S. Chundawat, Balan Venkatesh, 2007; Teymouri, Laureano-Perez, Alizadeh, & Dale, 2005).

Biological strategies entail the employment of microbes such as white and soft rot fungi, which may breakdown the components of lignocellulosic biomass. A wide range of naturally occurring microorganisms (single or in co-culture) or enzyme systems are used in biological pretreatment (pure or mixture). As a result, microbial pretreatment (fungal, bacterial, microbial consortia, and ensiling) and enzymatic pretreatment may be distinguished. These Lignin degrading enzymes include laccases and lignin peroxidases. Two of the most significant enzymes in the ligninolytic enzyme system are lignin peroxidase (EC 1.11.1.7) and manganese peroxidase (EC 1.11.1.7). Laccases (EC 1.10.3.2.) are copper-based enzymes that help break down lignin. Laccases work along with lignin peroxidase and manganese peroxidase to degrade lignin completely. Several white-rot fungi have been studied, including *Cyathus stercolerus, Ceriporiopsis subvermispora*, *Ceriporia lacerate, Pleurotus ostreaus*, *Pycnoporus cinnarbarinus*, and *Phanerochaete chrysosporium*, with excellent delignification efficiency and enhanced hydrolysis ef-

ficiency (Chiaramonti et al., 2012; Sindhu, Binod, & Pandey, 2016). Because no chemicals are used in these procedures, they are both ecologically benign and inexpensive to run. However, the hydrolysis rate is lower; therefore the process would take longer. The inadequate hydrolysis rate is the most notable drawback of using fungus to pretreat woody materials. Enzymatic hydrolysis can be utilised to convert leftover lignocellulose into sugars after pretreatment. Apart from the kind of feedstock, the pretreatment method must be selected depending on the biofuels cost economics (Arora et al., 2019; Dahman, Syed, et al., 2019; Raud et al., 2019).

Saccharification

The saccharification of the cellulose fibrils exposed in the pretreatment step into fermentable sugars via a hydrolysis process is the next step in the biochemical process. The activity of hydrolytic enzymes breaks down cellulose and hemicellulose into glucose and xylose. Cellulases, hemicellulases, and auxiliary enzymes are required for full biomass decomposition. Cellulases are the primary enzymes, which are very specialized and may be split into three classes depending on where they attack. Endocellulases (EG) (EC.3.2.1.4) target cellulose fiber areas with poor crystallinity and produce cello-oligosaccharides with free-chain endings. Exocellulases (CBH) (EC.3.2.1.91) further breakdown the molecule by cleaving cellobiose units from free chain ends. Endo and exocellulases hydrolyze cellulose to form cello-oligosaccharides and cellobioses, which are then hydrolyzed into individual glucose molecules by Cellobioses or β-glucosidases (BG) (EC.3.2.1.21) (Horn, Vaaje-Kolstad, Westereng, & Eijsink, 2012). Aerobic microorganisms such as *Actinomycetales* and anaerobic microbes such as *Clostridiales* may both create cellulases. *Trichoderma reesei* is an aerobic fungus that can synthesize all three cellulases (Arora et al., 2019). Cellulase blends provide an advantage over individual enzymes since they operate synergistically to increase the hydrolysis rate. Commercial grade cellulases are available from Novozymes (Enzyme cocktails - Cellic CTec2, Cellic CTec3) and Genencor (Multifect CL, Multifect GC from *T. reesi*) (Saini et al., 2015). The hydrolysis process is influenced by elements such as substrate content, cellulase activity and loading, temperature, pH, hydrolysis duration, cellulose molecular structure and crystallinity, cellulose fiber surface area, and so on. The use of thermostable cellulases from fungi such as *Chaetomium thermophilum, Myceliophthora thermophila, Talaromyces emersonii*, *Thermoascus aurantiacus*, and *Tribulus terrestris* in bioethanol production is being researched (Guo et al., 2015). Endo-1, 4-β-xylanase (EC 3.2.1.8), and β-xylosidase are the primary enzymes involved (EC 3.2.1.37). Endoxylanases cleave the key chain of xylan at random, resulting in a variety of xylooligosaccharides, whereas β-xylosidase liberates xylose by eliminating terminal monosaccharides from the non-reducing end of short oligosaccharides. The L-arabinose residues are hydrolyzed by α-L-arabinofuranosidase (EC 3.2.1.55). α-D-glucuronidase (EC 3.2.1.139) cleaves α -1, 2 bonds between glucuronic acid residues and β-D-xylopyranosyl, and acetylxylan esterase (EC 3.1.1.72) eliminate the O-acetyl of acetyl xylan. In reality, hemicellulose biodegradation is a complicated process that necessitates the coordinated activity of many hemicellulases (Chávez, Bull, & Eyzaguirre, 2006; Peng et al., 2012; Sunna & Antranikian, 1997). The cost of enzymes is the most significant constraint for commercial biochemical conversion. With various research studies conducted throughout the world in recent years, the cost has been significantly decreased (A. Demirbas, 2008b; Mohapatra et al., 2019).

Fermentation

Hexoses and pentoses are end products of the biomass saccharification phase that can be fermented to produce biofuels. Microbes employed in commercial bioethanol production should be able to use a wide range of substrates, produce a large amount of ethanol, tolerate high temperatures, produce low pH and inhibitors throughout the pretreatment and saccharification processes, and tolerate high sugar and ethanol concentrations (Saini et al., 2015). *Saccharomyces cerevisiae*, *Zymomonas mobilis*, and certain genetically modified microorganisms can ferment hydrolyzed biomass containing various sugars to produce ethanol. They cannot, however, ferment pentoses and have a lower tolerance for high sugar concentrations (Robak & Balcerek, 2018). *Pichia stipites* (Agbogbo, Haagensen, Milam, & Wenger, 2008), *Candida shehatae*, *Pachysolan tannophilus* (Perego, Converti, Palazzi, Del Borghi, & Ferraiolo, 1990), and *Kluyveromyces marixianus* (Hasunuma & Kondo, 2012) may ferment pentoses as well as hexoses, but their efficiency is lower, and they are also sensitive to process variables such as temperature, pH, inhibitors, and so on. For biomass conversion into biofuel, a variety of techniques have been investigated. The first way is Separate hydrolysis and fermentation (SHF), in which cellulose saccharification (hydrolysis) and fermentation are performed in separate units, ensuring that the hydrolysis and ethanol production processes are carried out under optimal circumstances. The buildup of carbohydrates, on the other hand, may limit enzyme function. Simultaneous saccharification and fermentation, or SSF, is the next strategy, in which saccharification and fermentation are done in the same unit. The sugars generated by cellulose hydrolysis would be quickly fermented into ethanol in this method. This prevents the sugars from accumulating, resulting in higher ethanol production with fewer enzymes. The operating temperature is the primary drawback of this process, since the optimal temperature for hydrolysis is generally 50°C, while yeast viability is lower (28-37°C) (Olofsson, Bertilsson, & Lidén, 2008; Wingren, Galbe, & Zacchi, 2003). The third method on the list is a variation of SSF in which both hexoses and pentoses can be fermented simultaneously, thus the term simultaneous saccharification and co-fermentation (SSCF). The utilization of mixed cultures can help achieve this. Because bacteria that can utilize hexoses grow faster than those that can use pentoses, the conversion of hexoses to ethanol is more common. A second technique, on the other hand, is to utilize a single microbe that can take in together hexoses and pentoses, letting for high conversion and ethanol yield. To further understand the commercialization aspect of this process, more study is needed (W. C. Chen et al., 2017; McMillan, Newman, Templeton, & Mohagheghi, 1999). Consolidated bioprocessing (CPB) technology is a newer technique that goes a step further. CBP method for biofuel generation from lignocelluloses entails combining all three biological activities in a single bioreactor: synthesis of saccharolytic enzymes, hydrolysis of polysaccharides in pretreated biomass, and fermentation of hexose and pentose sugars. Production of enzymes that can successfully hydrolyze lignocellulosic biomass to fermentable sugars, utilization of hexoses and pentoses, efficient ethanol production (titer, yield, and productivity), fermentation inhibitors, resistance to ethanol, and stressful conditions such as low pH, high osmotic pressure, high temperature, low nutrition capacity, and fluctuating processes are the basic requirements of a microbe for this technology. No natural microbe, however, possesses all of the characteristics necessary for this technique (Hasunuma & Kondo, 2012; Olguin-Maciel, Singh, Chable-Villacis, Tapia-Tussell, & Ruiz, 2020). *S. cerevisiae*, a usual good ethanol producer with high inhibitor tolerance, can be transformed to produce the enzyme cellulases and hemicellulases, or *Clostridium thermocellum*, *C. phytofermentans*, that produces cellulases and hemicellulases, can be modified to be an proficient ethanol producer using genetic engineering technology (M. Balat, Balat, & Öz, 2008; Mohapatra et al., 2019). Because just one reactor is needed, charges

for enzyme manufacturing may be avoided; the complete substrate is utilised for sugar release and no part of it is used for cellulase production. However, due to factors such as a long fermentation duration, low ethanol production, limited tolerance to ethanol, and the creation of fermentation inhibitors, this configuration has not yet been fully developed at a commercial level. Significant research has to be done to commercialize this process (Mohapatra et al., 2019; Raud et al., 2019).

Table 4. Various studies used lignocellulosic biomass for the production of biofuels

Substrate type	Organism	Fermentation type	Product and yield	References
Cassava bagasse	*S. cerevisiae*	Submerged fermentation	Bioethanol-0.25 m3/ton	(Martinez, Feiden, Baricatti, & Zara, 2018)
Cassava bagasse	*Rhizopus oligosporus*	Solid-state Fermentation	Bioethanol-89.2%	(Escaramboni, Fernández Núñez, Carvalho, & de Oliva Neto, 2018)
Cassava cellulosic waste	*S. cerevisiae*	Submerged fermentation	Bioethanol-32.4% alcohol	(Elemike, Oseghale, & Okoye, 2015)
Sugarcane straw	*S. cerevisiae* Y 904	Solid-state Fermentation	Bioethanol-290 L/ton	(Pratto, dos Santos-Rocha, Longati, de Sousa Júnior, & Cruz, 2020)
Sugarcane-Leaf Waste	*S. cerevisiae* BY4743	Steam-salt alkali unfiltered (SSA-U)	Bioethanol-31.06 g/L	(Moodley & Gueguim Kana, 2019)
Sugar beet cossettes	*S. cerevisiae*	Submerged fermentation	Bioethanol-0.618g/L	(Pavlečić, Rezić, Šantek, Horvat, & Šantek, 2017)
Sugar Beet Pomace	*S. cerevisiae* PM-16	Solid-state Fermentation	Bioethanol-358.458 mg/g	(Rodríguez et al., 2010)
Sorghum pioneer	*S. cerevisiae*	Submerged fermentation	Bioethanol-0.49 g/l	(Koradiya, Duggirala, Tipre, & Dave, 2016)
Corn stover	*S. cerevisiae*	Submerged fermentation	Bioethanol-40.0 g/L	(Lau & Dale, 2009)
Sweet potato (hydrolysate)	*S. cerevisiae*	Submerged fermentation	Bioethanol-67.8 g/L	(Duvernay et al., 2013)
Switchgrass hydrolysate	*C. beijerinckii* P260	Submerged fermentation	Acetone -0.41 g/L; Butanol 0.97 g/L; Ethanol 0.10 g/L	(Qureshi et al., 2010)
King grass	*S. cerevisiae*	Submerged fermentation	Bioethanol - 30.8 g/L	(Cardona, Rios, Peña, Peñuela, & Rios, 2016)
Cocksfoot grass	*S. cerevisiae*	Simultaneous saccharification and fermentation (SSF)	Bioethanol - 31.49 g/L	(Njoku et al., 2013)
Apple & pear peel extracts	*C. acetobutylicum*	Submerged fermentation	Butanol-14 g/L	(Raganati, Procentese, Olivieri, Russo, & Marzocchella, 2016)
Rice straw	*C. acetobutylicum*	Submerged fermentation (Anaerobic)	Butanol-80 g/kg ,Acetone-21 g/kg	(Amiri, Karimi, & Zilouei, 2014)
Rice straw	*C. acetobutylicum*	Submerged fermentation (Anaerobic)	Acetone-18.2 g ; Butanol - 44.2 g; ; Ethanol -0.6 g	(Moradi, Amiri, Soleimanian-Zad, Ehsani, & Karimi, 2013)
Rice straw	*Pleurotus ostreatus*	Solid-state Fermentation	Methane -263 and 214 L/kg	(Mustafa, Poulsen, & Sheng, 2016)
Rice straw hydrolysate	*C. saccharoperbutylacetonicum*	Submerged fermentation (Anaerobic)	Acetone-5.1 g/L ; D Butanol-1.26 g/L/; Ethanol-8.1 g/L	(Wen Hsing Chen, Chen, & Lin, 2013)
Sago waste residues	*Bacillus coagulans*, *C. bifermentans*and *Clostridium* spp.	Submerged fermentation	Butanol-1.53 g/L; 3.36 g/L; 1.56 g/L; 2.5 g/L	(Johnravindar, Murugesan, Wong, & Elangovan, 2017)
Orange peel waste	*S. cerevisiae* & *C. acetobutylicum*	Submerged fermentation	Bio-butanol-19.5 g/L	(Joshi, Waghmare, Sonawane, & Waghmare, 2015)
Cauliflower waste	*C. acetobutylicum* NRRL B 527	Submerged fermentation	Acetone-Butanol-Ethanol-5.35 g/L	(Khedkar, Nimbalkar, Chavan, Chendake, & Bankar, 2017)
Lettuce residues	*C. acetobutylicum* DSMZ 792	Submerged fermentation	Butanol-1.1 g/L	(Procentese, Raganati, Olivieri, Elena Russo, & Marzocchella, 2017)
Sweet potato peel	*S. cerevisiae*	Submerged fermentation	Bioethanol-6.39g/L	(Ojewumi et al., 2018)

FUTURE RESEARCH DIRECTIONS

To address the extraordinary speed of climate change effected by the amassing of greenhouse gases (GHGs) in the atmosphere, there is a clear urgent need to convert energy dependency from fossil fuels to renewable energy sources. There are possibly two ways existed to reduce GHG emissions, one by reducing the usage of fuels and later being the replacement of harmful fuel with a less harmful one. Changes in climate and energy policy should be at the center of the country's global agenda, seeing as they have an impact on social, economic, and political decisions. To address these issues, employing environmentally acceptable, biodegradable, and cost-effective alternatives like biofuel might be an excellent choice. First-generation biofuels include corn ethanol, sugarcane ethanol, pure plant oils, and starch-based biodiesel. Because their technologies and implementation are easy, biofuel production technologies of the first generation have been successfully created and are widely used. However, the major drawback of first-generation biofuels is the food-versus-fuel conundrum; growing production of these fuels is one of the factors driving up food prices. As a reason, the lignocellulosic feedstock can develop alternative biofuels, which are frequently referred to as "second generation" biofuels. Under laboratory conditions; bioethanol synthesis from lignocellulosic biomass offers a good fuel output. However, various obstacles must be overcome before the manufacturing method can be commercialized. Various efforts to commercialize second-generation biofuels are underway across the world. In the case of biochemical fuels, breakthroughs in research and engineering of microorganisms meant to process specific feedstocks are required, followed by large-scale demonstrations to establish commercial practicality. The high capital and processing expenses of bioethanol from lignocellulosic biomass are a major drawback since specialized technology and infrastructure are required to facilitate the conversion process. When the production is scaled up, the price will fall. A number of public and private sources, including venture capital funds and internal resources from big organizations, have financed notable work in critical areas including safety, research, and development.

Development of biomass feedstocks with lesser lignin content and higher cellulose content.
Development of enzymes like cellulases and hemicellulases that depolymerize the biomass to achieve higher activity thus increasing the content of fermentable sugars and also reducing the content of inhibitors.
Development of novel microorganisms through metabolic engineering that can show resistance towards high ethanol, high temperatures, and can ferment pentoses along with hexoses.

This assistance has aided in moving it forward; nevertheless, additional assistance is required to make it a reality.

CONCLUSION

Technological innovations driven by the use of fossil fuels have enhanced human civilization and made it more comfortable; yet, this comfort has come at significant expenses. Biofuels have evolved to represent one of the main crucial sustainable fuel sources, and they are viewed as vital in our attempts to reduce greenhouse gas emissions, enhance environmental wellbeing, and create innovative energy sources. Biofuels, unlike fossil fuels, are generated from organic sources like biomass, which includes plants, crops,

and agricultural waste. Furthermore, because of the abundance of agricultural feedstock such as forest residues, bagasse, native plants & fibers, corn stover, SPRs, bast crops & so on, developing countries, such as India, can be targeted for socioeconomic development using a biorefinery approach. Some of the obstacles that are identified that could hamper the biofuel economy are, the lack of refueling structure; costly zero-emission biofuel extraction; some forms of biofuel-based automobiles exhibit technology gaps, fuel cell lifespan. However, owing to a lack of knowledge and inadequate valuation, these useful wastes are often destroyed in large quantities for waste management rather than being used constructively. These wastes can be employed as a raw material in numerous investigations and industries, as well as an alternative source for the manufacture of various products such as biogas and biofuel. Adapted biogas processes are paving a new path to mitigate these swings by adapting operating and storage principles, whether that is through feedstock, biogas, or power, in response to changing net energy requirements.

When spoken about the future of Biofuels, the Country's developmental aspects for biofuel usage are influenced by factors like environmental worries on net carbon emissions, as well as security risks on the reliability and expense of fuel imports. Next few decades, the development of more efficient biofuel technologies might double or triple yields, as well as raise the energy output/input ratio in some of the less efficient bioenergy crops like maize or wheat. The biofuel sector is notably upsetting food production and prices in several parts of the world, a measured evidence-based assessment of biofuels that addresses a wide range of socio-economic and technological gaps in the biofuel sector. It has to be noted that biofuels are essentially economic, as biofuels long-term viability is highly reliant on their profitability. Elements like environmental and economic stability, as well as how technology permits these items to evolve must be taken into account. Biofuel production is now most viable in ecologically limited tropical locations due to the increased biofuel yields per acre and cheaper input prices. Also, Biofuel production has a primary profit element, which is based on resources that would substantially undercut the rise in oil prices. If nations throughout the world can use biofuels in the coming years, it will have a tremendous influence on the global economic structure and environment.

ACKNOWLEDGMENT

Kondapalli Vamsi Krishna and Sompalli Bhavana would like to acknowledge the fellowship from KSTePS, Department of Science and Technology (DST), Govt. of Karnataka for fellowship to pursue their Ph.D. work. Koushik Koujalagi would like to thank Christ (Deemed to be University) for a Ph.D. fellowship.

ABSTRACT

Biogas is a renewable natural gas used in production of energy which is generated by breakdown of organic matter by anaerobic digestion. It is a composition of methane, carbon dioxide, and some other gases in small quantities. The most common natural resources for production of biogas are aquatic sediments, animal waste, crop residues, wastewater sludge, and many others. Some other sources are landfills, water lagoons, etc., which are a result of human activity. There are several technologies used for biogas production, mainly biodigesters, wastewater treatment plants, and landfill gas recovery systems. Production of biogas is highly dependent on the feedstock availability and the policy support by the government.

INTRODUCTION

Fossil fuels are among the most highly used sources of non-renewable energy which lead to 80% of the global needs. To attain sustainable economic growth, antagonistic and fast-paced deployment of renewable resources is needed. One of the most common sources of energy is fossil fuels. To sustain the non-renewable sources, we need accelerated and antagonistic deployment of efficient energy sources by the second half of the century (IRENA, 2017a). The use of efficient bioenergy conversion and modern technologies are gaining high importance recently which are used to fulfill the demand of global energy

needs. Biogas is one of the most cost-effective and ecologically beneficial forms of renewable energy (Deublein & Steinhauser, 2011). It could be a viable option for the world's insatiable energy demand while also reducing waste and greenhouse gas (GHG) emissions. Anaerobic digestion may transform sewage sludge, agricultural and crop leftovers, animal dung and industrial organic wastes, and wastewaters into biogas. The type of the raw materials used for digestion, as well as the pH of the medium, influence the composition of biogas (Muoz et al. 2015). Under anaerobic conditions, bacteria decompose complex organic matter into simpler components, resulting in biogas and fertilizer (Gemmeke, 2009 & Piwowar, 2020). The technique of using anaerobic respiration for the production of biogas has numerous environmental benefits. It helps to treat organic wastes along with introducing green energy, protecting the environment, and also helps to reduce greenhouse gas emissions (Falk, 2011; Theuerl, 2019; Daniel, 2017; Gemmeke, 2009; Stolze, 2017]. There are four phases to the biodegradation of complex organic compounds. Hydrolysis, acidogenesis, acetogenesis, and methanogenesis, are the respective steps (Rohstoffe, 2012). The composition of biogas has a higher concentration of methane which generally makes up to 50% to 75%. This methane content makes the biogas flammable and also generates a blue flame which can be used as an energy source.

The calorific value is fixed on the basis of the concentration of CH_4 as the other substances do not play a major role in the energy content. The calorific value of raw biogas is 21MJ/m^3 considering that the density of 1.22 kg/Nm^3 CH_4 present in the raw biogas is up to 50% which is also similar to that of air (1.29 kg/Nm^3) (Rutz and Janssen 2008). So as to know more about the various applications of biogas, it is a must that the concentration of CH_4 is appreciably higher (i.e. >90%). This also states that the utilization capacity of any biogas is determined by the composition of the gas. Upgrading biogas is a widely used, well-developed, and easily obtainable technique. It is becoming more widely used around the world, although it is still in its infancy when compared to the biogas producing industry. After treatment, biogas can be used for a variety of purposes, including electricity and heat generation, natural gas grid connection, and automotive biofuel (Rosen T, 2019).

BIOLOGICAL REACTIONS

Hydrolysis, acidogenesis, acetogenesis, and methanogenesis, are the procedures followed after then numerous complex biochemical reactions and as a product of these, biogas is formed (Ghodrat et al., 2018). The complete reaction of conversion of food wastes into biogas is as follows (Deublein & Steinhauser, 2011):

$$C_cH_nO_oN_nS_s + wH_2O \rightarrow mCH_4 + nNH_3 + sH_2S + (c-m)\ CO_2$$

where, m= ⅛ (4c+h-2o-3n-2s)

w = ¼ (4c-h-2o+3n+3s)

Carbohydrates ($C_6H_{12}O_6$), proteins ($C_{13}H_{25}O_7N_3S$), and lipids ($C_{12}H_{24}O_6$) come under the degradable fraction of the food waste.

Individual stages are controlled by various microorganism consortia, which have syntrophic interactions with the microbial consortia participating in the other stages. On hydrolyzing bacteria excrete

exo-enzymes such as cellulase, protease, lipase, amylase, and xylanase, initiation of hydrolysis is done. These hydrolytic exo-enzymes are absorbed in the surface of the substrate which leads to the progressive conversion of the polymers to monomers and then further to oligomers (e.g., glucose, fatty acids, glycerol, and amino acids). The enzymes used in all these conversions are water-soluble. Hydrolysis is the stage that is considered to be the restricting stage in the biogas production from the wastewaters which contains a substantial number of recalcitrant compounds such as lignocelluloses.

The launched monomers and oligomers are then degraded to quick-chain fatty acids (propionate, acetate, butyrate, and lactate), alcohols, and gaseous byproducts (NH_3, H_2, CO_2, and H_2S) via the acidogenesis stage. All the unnecessary oxygen present can be broken down and digested with the help of facultative anaerobic microorganisms which are present inside the first 2 degrees. The anaerobic environment present inside proves to be obligatorily for the microorganisms. On the 0.33 level. All the organic materials which were formed in the last stages are then transformed into hydrogen, carbon dioxide, and acetic acid. Methanogens present then produce methane from either CO_2, acetate, or methyl under strictly anaerobic conditions.

PROCESS OF BIOMETHANATION

The anaerobic biological conversion of organics substances occurs in 4 steps. The four levels of methane fermentation are shown in Fig.1.

Figure 1. Steps of anaerobic digestion process- anaerobic treatment of industrial effluents

1. Hydrolysis

The anaerobic digesters usually encounter the organic biomass which consists of many compound polymers which the microorganisms have to break down. As they are not pretreated or hydrolyzed, it is expected that the microorganisms break these complex compounds into simpler forms (Gujer W, 1983). In the stage of hydrolysis, the microorganisms break down the organic macromolecules into much smaller compounds which are then used up by the acidogenic bacteria for anaerobic digestion.

In hydrolysis, the hydrolytic bacteria secrete extracellular enzymes which are capable of converting carbohydrates, lipids, and proteins to sugars, long-chain fatty acids, and amino acids respectively (Daniel, 2017). Once the enzymatic cleavage is formed, the products formed in the step of hydrolysis are diffused through the cell membrane of the acidogenic microorganisms (Gemmeke, 2009). For complex substances (such as cellulose, lignin, hemicellulose, etc.) enzymes are added to the process of hydrolysis of carbohydrates as these cannot be hydrolyzed by the microorganisms alone (Stolze, 2017).

Prior research has suggested that hydrolysis is a rate-determining step. It was found in the previous research that methanogenesis can be said to be the rate-determining stage which is dependent on the ratio of the rate of hydrolysis of methanogenic microorganisms (Lin, 2010; Luo, 2012).

For all the steps which take place in hydrolysis, there is an optimum temperature and pH at which the hydrolytic activity is at its peak. At 30-50°C and pH 5-7 are the optimal temperatures and pH respectively for hydrolysis. It has not been found yet whether or not the process of hydrolysis is improved below a pH of 7 (Huang, 2015).

2. Acidogenesis

Volatile Fatty Acids (VFA) and all other products are produced by acidogenic microorganisms by absorbing the products during the process of hydrolysis. This absorption takes place from their cell membranes.

The concentrations of the intermediates of the product in the acidogenesis stage majorly depend on the condition present in the digester. It has been observed that under different pH conditions, the VFA also fluctuates significantly (Huang, 2015; Wu, 2010).

Usually, the VFA production from amino acids is examined in protein-rich wastes such as sewage wastewaters. The process of anaerobic digestion can be inhibited by the presence of ammonia which can be formed after the deamination of amino acids at high concentrations (Kovacs E., 2013; Park J, 2014).

3. Acetogenesis

Acetate is produced through the step of acidogenesis, the original substrate is likely to be rendered into the substrate which is suitable for acetoclastic methanogenesis (Fournier G.P, 2008). The process of conversion of the larger quantities of VFAs along with other intermediates into acetate in which hydrogen is produced as well is known as acetogenesis (Hansen C.L., 2013).

Hydrogenotrophic methanogens present in the digester help to consume the additional hydrogen produced and also maintain the partial pressure at favorable levels for the continuation of acetogenesis which is done by creating exergonic reactions (Stams, A.J.M., 2009). While the partial pressure is being maintained, the lipids present go through a completely different process of acetogenesis via β-oxidation and acetogenesis. While acetogenesis leads to the production of acetate from glycerol and β-oxidation helps in the production of acetate from LCFAs (Cirne D.G., 2007).

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

4. Methanogenesis

Methanogenesis is the final step of anaerobic digestion. So as to produce methane gas, the intermediates accessible are all consumed by methanogenic organisms present in the batch (Ferry, J.G., 2010) [27]. The group of obligate anaerobic archea represents the methanogenic microorganisms which are the testers for detecting acute sensitivity to oxygen levels. *Echinococcus vannielli* and *Methanococcus voltae* were the microorganisms that were found. 99% of these were killed within 10 hours of them being exposed to oxygen (Kiener A., 1983).

Roughly around ⅔rd of the methane production from acetate is accounted for by acetoclastic methanogenesis, while hydrogenotrophic methanogenesis accounts for the rest ⅓rd methane production. It has also been observed that methanol, methylamines, and formate also undergo methanogenesis (Belay N., 1986 & Lovley D.R., 1983).

When the biogas production stops, which can even take up to 40 days it is considered the end of the methanogenesis in the batch reactors (Theuerl S., 2019). The volatile solid content and the ability to dewater the sludge can help to evaluate the sludge's extent of digestion.

PROCESS PARAMETERS

Along with all the biological processes, the consistency of the conditions provided is important. There are several factors such as temperature changes, changes in the substrate concentration, etc. which can affect the production of biogas. The optimum condition for the microorganisms which affect the degradation of the microbes can depend on two different stages: the first stage is for hydrolysis/ acidification and the second stage is for acetogenesis/ methanation. This is stated, given that the entire process of degradation takes place in the same reaction system and that the appropriate conditions for methanogenesis must be fulfilled, because if they don't receive the optimal conditions then there is no chance of their survival within the mixed culture as their growth rate is also very less along with the high sensitivity to environmental factors.

1. Hydrogen Partial Pressure

So as to get an undisturbed process between the acetogenic bacteria producing H_2 and the H_2 consuming bacteria, a restricted spatial symbiosis is required. The concentration of hydrogen should be properly balanced: for the production of methane, methanogenesis requires a sufficient amount of hydrogen. However, it is proved that the partial pressure of hydrogen surrounding the acetogenic bacteria should be less, causing them to stop the production of hydrogen. The substrate and the bacteria present determine the maximum permissible hydrogen pressure.

2. Concentration of Microorganisms

Since the step of methanogenesis has a lower growth rate, biogas plants usually are considered to have a longer start phase. This can also take around 3 months in which the necessary amount of sludge which is inoculated, will start the plant at its full capacity as fast as it can, as the buildup is not available at the starting phase.

3. Type of Substrate

The rate of anaerobic degradation is measured by the substrate, and it must be taken into consideration for the process of operation and technology. The microorganism's metabolism tends to run out once the substrate component runs short. Hence, it is important to feed the batch lacking substances (carbohydrates, fat, proteins, mineral substances, and trace elements) and also the substrate. For example, sugar hydrolyzes and acidifies in a really short span of time. Whereas cellulose is substantially slow and can take a pretty long time to degrade. Even medium- and heavy-weight degradable compounds hydrolyze and are eventually transformed to methane after 20 days or longer of residence.

4. Light

Methanogenesis is not killed by light, although it is substantially hampered by it. As a result, the creation of methane should take place in complete darkness.

5. Temperature

Mesophilic (35˚C) and thermophilic (55˚C) are the two different temperatures that are used for the process of anaerobic digestion. The mesophilic digesters are preferred over the thermophilic digesters even though the mesophilic digestion takes place at a much lower temperature and hence is slower than thermophilic digestion and yields less biomass. Mesophilic digesters are preferred due to their lower heater energy costs (Moset V., 2015). Thermophilic digestion takes place at a higher temperature compared to mesophilic digestion. Consequently, the rate of reaction is increased which leads to higher loading rates and hence an increase in the production of biogas (Moset V., 2015 & Shi, X. S., 2017). This thermophilic digestion is believed to have higher levels of pathogen clearance, which could be advantageous in some jurisdictions where pathogenic activity in effluents is regulated (Smith, 2005).

6. pH

There are no pH buffer ions which are released which degradation of the proteins and the hydrocarbons are also easier to acidify. Hence the value of pH is observed to decrease easily. As the degradation of carbohydrates and other substances takes place, the partial pressure of hydrogen increases. With the increase in the hydrogen pressure, the formation of acidic intermediate products is reduced. pH is kept in the neutral range by some natural processes in the fermenter.

Disturbance in the fermentation process can be checked by the drop in the pH and increase in levels of CO_2. The very first sign of acidification occurring is the increase of the propionic acid concentration.

7. Carbon and Nitrogen Ratio

During the process of anaerobic digestion, not much quantity of biomass is produced hence the need for nutrients is also comparatively low. The substrates which have a lesser C/N ratio will lead to an increase in the production of ammonia and inhibition of methane production. The high C/N ratio indicates the lack of nitrogen which leads to negative consequences on the protein formation mechanics and hence changes are observed in the structural, energy, and material of the microorganisms. Therefore, it is nec-

essary to maintain the balance. For example: In China, a mixture of latrine waste and rice straw is used and in Nepal, co-fermentation occurs between human waste and elephant dung.

8. Biogas Removal

The degassing nature of the substrate is of utmost importance whenever the produced gases lead to metabolism inhibition. The transfer of materials from liquid to gaseous phase can be affected by any technical means. The $K_L a$ value of the produced biogas can be increased by 50% by this transfer from liquid to gaseous phase and inhibition of the microorganisms by H_2S can be reduced.

INHIBITORS

Composition of the substrate, concentration of inhibitors, and adaptation of bacteria to inhibitors help to determine the inhibition. Less quantity of inhibitors is needed for anaerobic bacteria as they degrade if high amounts of inhibitors are present. It has been observed that usually the anaerobic processes are mostly adaptable and hence relatively insensitive to inhibitors and also to toxic concentrations under other conditions.

REACTOR DESIGNS AND OPERATIONS

Below mentioned are the criterion which needs to be considered before choosing the optimum biogas reactor's design:

- Dry matter (DM) content of the substrate: Wet digestion (DM < 12%) and dry digestion (DM > 12%)
- Material feeding mode: semi-continuous (i.e. addition once per working day), intermittent (i.e. no addition of substrate during dwell period).
- Number of process phases: Single-phase (all steps take place in the same reactor) and two-phase (hydrolysis and methanogenesis take place in separate reactors)
- Process temperature: Psychrophilic (<25 °C), mesophilic (37 to 42 °C) and thermophilic (50 to (50 to 60°C) (Rohstoffe, 2012).

CONCLUSION

Various organic wastes can be easily treated by the process of anaerobic digestion and the production of biogas. There are several environmental and economic benefits of the biogas production. Production of biogas is affected by factors such as the type of organic waste, type of bioreactor, pH, temperature, levels of oxygen etc. The aim of this book chapter is to present a summary of the process of biomethanation, process parameters, and the factors for reactor designs and operations. A review of the literature suggests that there is a considerable prospect of increasing biogas generation in the field. The use of certain inorganic and organic additives to boost biogas production appears to be promising.

ABSTRACT

With the increasing population, there are problems like the shrinking of arable land, pollution, and feeding the entire growing population high-quality food and reaching consumer demand, and the list goes on. Novel superfoods are rich in nutrition and produced with the most sustainable methods, including algae, specifically microalgae. Microalgae have been studied for decades. Microalgae are one of the largest and most poorly understood organisms on planet earth, but in recent years, the research has been increased for the search of renewable and sustainable energy sources. Microalgae don't require much land for cultivation and thus do not compete with conventional agricultural land. Microalgae can double their size in 24 hours. CO2, solar rays, inorganic nutrients, and water are the basic requirements for them to grow. There are microalgae and macroalgae (e.g., seaweed) that grow in saline and hypersaline water. This chapter presents the promising potential of algae (microalgae and macroalgae) as a superfood.

BACKGROUND

In the year 1753 Carolus Linnaeus a Swedish botanist coined the term algae. Algae come under a division of the plant kingdom called Thallophyte which means, simple plants without roots stems, or leaves known as thallus. Algae are eukaryotic in nature but blue-green algae (cyanobacteria) are prokaryotic in nature. The composition of the eukaryotic algal cell consists of the cell wall, nucleus, endoplasmic reticulum, mitochondria, Golgi bodies, stigma or eyespot, vacuoles, flagella, and plastids.

COMPOSITION OF ALGAE

The cell surface plays a very vital role in both the external and internal sides of the cell. Various functions of cell surface include cell interaction, cell signaling, excretion and secretion of various compounds, protection, and servers as an osmatic barrier. The cyanobacteria are enveloped by two parts of the gelatinous sheath and cell wall. The sheath is very slimy in nature which acts as a protective layer. Due to their slimness blue-green algae are also called my xophyceae. Algae also consist of a cell wall outside the plasma membrane, it presents a granular structure and lacks microfibrils. The cell wall is composed of Glycosamine, muramic acid and diaminopimelic acid. It has a structure of gram-negative type.

Protoplast

Cyanobacteria lack chloroplast but have Chromoplasm. Protoplasm is totally differentiated into two regions.

1. Centro Plasm (Central Area)

It is a clear and transparent region of the protoplast that contains chromatin or genetic material.

2. Chromoplasm (Peripheral Denser Region)

In this region, thylakoids are present which consists of chlorophyll A responsible for providing green color in blue-green algae, and several types of carotenoids are embedded into it. thylakoids are not restricted to peripheral reagion they are found scattered all over the cell (*Gloeotrichia* sp). phycobilins are on the surface of thylakoids. The best-known phycobilins are phycoerythrin and phycocyanin. Phycobilins are water-soluble whereas chloroplast and carotenoids are fat-soluble. phycocyanin C is the characteristic of blue-green algae and is responsible for the blue color in blue-green algae.

Gas Vacuoles

Tiny, transparent structures which are commonly found in bacteria and arches. Gas vacuoles are responsible for the floating of algae. Nitrogen and oxygen are majorly found gases but also have a minute amount of CO and CO2 which is liberated from metabolic activity. Gases are produced when there is not enough sunlight reaching the algae, especially in deep-underwater algae (*Trichodesmium sp*), they have low photosynthesis, low osmotic pressure, low production of carbohydrates and therefore increasing the density of the cell. Under these circumstances, gases are produced at a high rate and gain buoyancy.

Eukaryotic Cell Composition

The eukaryotic algal cell is simple, unicellular, motile, freshwater algae. It consists of membrane-bound organelles.

Cell Wall

Most of the algae have a cell wall made up of multiple microfibrils like cellulose, callose, pectin, chitin, and hemicellulose. In a few marine forms of algae, lime and silica are found as cell wall components because of the environment they have adapted to grow.

Plastids

Plastids are pigments that contain photosynthetic pigments. They are the site for the manufacture and storage of chemical compounds. Plastids in algae are slightly different from plant plastids that is the presence of pyrenoids in algae and absent in plants. Plastids are differentiated based on the pigment they contain, and they are chloroplast and chromophore. Chloroplast consists of chlorophyll A and chlorophyll B (e.g., *chara* and *volvox*). Chlorophyll A is common for all the algae present for photosynthetic reaction. Chromophores have chlorophyll A and other carotenoids (*sargassum, laminaria*), and these carotenoids are responsible for a different color. Carotenoids are light-harvesting pigments, they capture the light and pass it on to the light reaction centre (chlorophyll A).

Flagella

It provides motility to the algae. These are emerging from the cytoplasm. Different variations of flagella can be found. Whiplash flagella (acronematic) have a smooth surface. While tinsel flagella (pantonematic) have a rough surface with many rows of minute hair-like structures grown to the main flagellum strand. Algae can be either of this flagellum are they may have both. isokont flagella are when flagella are of similar length and heterokont flagella are when flagella are not equal in length.

Eyespot

Photoreceptive organs are found associated with flagella and chloroplast (e.g., *Chlamydomonas*) and help the organism to sense the light and move in the direction of light.

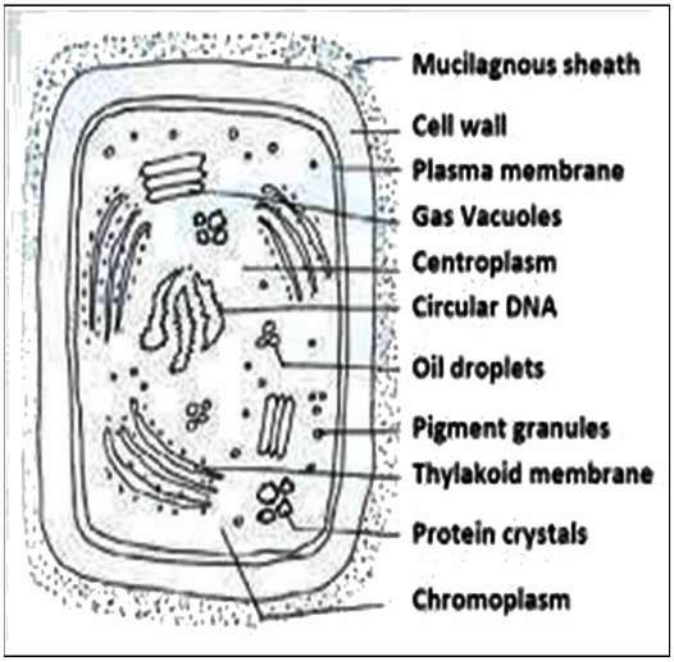
Figure 1. Cellular structure of algae



COMPOSITION OF SPIRULINA

The composition of spirulina is unique and extraordinary that it is called a superfood. Spirulina is composed of carbohydrates, protein, fats, vitamins, pigments and minerals. They also help in combating various kinds of diseases like anemia, vascular diseases, obesity, hepatotoxicity and certain cancers.

Protein

The protein content in spirulina is high which is 50 to 70 g/100 g of dry matter. Spirulina protein id totally different from other organisms which provide protein because spirulina doesn't contain any hard envelope like cellulose but has a very fragile envelope and has higher digestibility up to 83%-90% which makes it easier for people to consume and digest. It also contains Isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, and valine are necessary amino acids that cannot be synthesized by the human body. People with a vegetarian diet don't usually have sufficient lysine and methionine. It is known a complete protein because of its amino acid composition as it has every amino acid (essential and nonessential). The protein content of various foods: Eggs 13%, Soybean 42%, Grain 29%, Peanuts 25.3%, Spirulina 60%-70%.

Carbohydrate

Carbohydrates are considered a great source of quick energy for our body. Spirulina consists of 10%-15% in the form of polysaccharides. Glucose, fructose, and sucrose - are found in little quantity. Carbohydrates

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

offer 50-70 percent of the body's total energy requirements. Meso inositol phosphate is a carbohydrate present in larger and it consists of c phosphorus and inositol.

Lipids

Water insoluble lipids are soluble in organic solvents such as ether and chloroform. Dairy, cheeses, olives, walnuts, canola, soybeans, and flaxseed are the most prevalent sources of lipids. Spirulina has a lipid content of 5-6% of its dry mass. Many of the food sources which have fatty acids content are majorly meat products like beef, chicken, fish, egg, etc. spirulina is a vegetarian source that has the highest amount of fatty acid in it. Spirulina has gamma- linolenic, linoleic, and oleic acids in them. Gamma-linolenic acid is known to have the ability to suppress cancer growth.

Vitamins

Vitamins are organic compounds required by the body in the trace amount to perform a specific cellular metabolic activity to keep the body in functional condition. They cannot be synthesized by the human body, and therefore they must be supplied through the diet. Spirulina contains a vitamin known as vitamin B12 (COBALMINE) it is found in coordination complex with cobalt. Spirulina has the highest content of vitamin B12 compared to other seaweeds found in the water. Usually, vitamin b12 is prominently found in meat-based food, and people who consume a vegetarian diet lack this vitamin. Beta-carotene is abundant in spirulina., it contains700-1700 mg/kg. Recommended daily allowance of vitamin A per day is 1 mg per day. Consumption of 1-2g of spirulina is enough to gain enough beta-carotene.

Minerals

Minerals are essential components for the body to function properly and are required in trace amounts and are found in all kinds of food we consume. Particularly in iron, calcium, phosphorus and potassium are found in high amounts. Food with high iron content is hard to find, Cereals are considered one of the good sources of food with high iron content in them (150-250 mg/kg) but they also contain phytates, and oxalates are known to suppress the bioavailability of iron.

Algae are main producers that provide a rich source of several nutrients. While the high protein content of diverse species is one of the primary reasons for considering them as an unusual source protein, microalgae oils rich in several PUFAs appear to be especially good for youngsters, pregnant women, vegetarians, and people with seafood allergies. Because algae are a rich source of vitamins, minerals, antioxidants, and natural colorants, incorporating the entire biomass into food and feed might give color, increase nutritional value, and enhance texture and oxidation resistance.

Combining microalgae biomass into traditional foods is a means to create novel items that are both appealing and healthful. Even when used in small quantities in the nutrition of various animals, algae have been given credit with immune health, rising weight, the amount of eggs, reproductive performance, or reducing cholesterol, indicating the potential of future farming methods to improve the quality of meat and eggs. It's also not unexpected that they're important in aquaculture because they're food supply for these creatures. Finally, microalga Spirulina, humanity's greatest and most perfect resource of organic nutrition, has become a nutritious food globally due to its high protein content and many bioactive components.

heterotrophic. In a scientific sense, the term algae refer to a group of reduced plants that contain chlorophyll in their cells and are common in oceanic biotopes, since they are also found in other environments (Blazencic, 2007). They are divided into macroalgae (macroscopic algae) and microalgae (microscopic algae) based on their size.

Blue-green algae, often known as cyanobacteria due to their prokaryotic cell type, are a form of microalgae that has been identified as one of the most promising living organisms for the separation of new and biochemically active bioactive substances (Singh et al., 2005). Algae are grown and utilised as food all around the world. They are rich in vitamins and minerals, enzymes, protein, unsaturated fats, antioxidants, and other nutrients. (Pulz and Gross, 2004; Svircev, 2005; Blazencic, 2007; Gouveia et al., 2008b).

Chemical Composition of Algae

One of the key reasons for considering microalgae as an unusual source of proteins is their high protein content, and because they can synthesize all the amino acids, they could also be a supply of essential amino acids. Furthermore, in comparison to normal plant proteins, the general standard of most studied algae is comparable, if not greater (Becker, 2007). Dried Spirulina biomass, for example, provides all necessary amino acids and has roughly 68 percent protein, which is three times more than beef. Chlorella, another microalga, has 50-60% protein, which is equivalent to yeast, soy flour, and milk powder proteins in terms of quality (Blazencic, 2007). Milovanovic et al. are a group of researchers that came up with a novel way to solve Milovanovic et al. (2012) looked examined the protein content of dry biomass from different cyanobacterial strains from Serbia, and found that they all have very high levels, ranging from 42.8 percent to 76.5 percent. Algae also contain a lot of fibre. Polysaccharides such as agar, alginates, and carrageenan, which are widely utilized in the food sector as gelling or thickener agents in marmalade, ice - cream, and jellies, are the most commercially important products from algae. Because they boost the human immune system, some algal polysaccharides are also beneficial in pharmacology.

Dr. Ashok Rathoure (asokumr@gmail.com)

ALGAE IS A SOURCE OF VITAMINS AND MINERALS

Algae is abundant in vitamins and minerals, making it a good choice for supplements. Most cultivated plants have lower vitamin content than chlorella species (Blazencic, 2007). Furthermore, the Spirulina genus has roughly ten times more -carotene than any other plant or animal nutritional source, including carrot (Mohammed et al., 2011), as well as much more vitamin B12. In comparison to green algae, leafy greens, and liver, this genus has the greatest vitamin E, thiamine, cobalamin, biotin, and inositol (Gantar and Svircev, 2008). Tocopherol is produced in large quantities by a number of microalgal species (T, the most physiologically active form of vitamin E). Rodriguez Zavala et al. (2010) reported that after 120 hours, the synthesis of -tocopherol in the heterotrophically cultivated microalga Euglena gracilis reached 3.70.2 mg/g, which is roughly 13, 18, 95, and 56 times more than sunflower, soybean, olive, and maize, respectively (some of the most common natural sources of vitamin E).

Algae as a Component of Functional Food

In industrialized nations, the food is rich in calories, which, when combined with a contemporary lifestyle, contributes to health issues such as obesity, heart disease, diabetes, and other ailments. As a result, there is a need for food items that can improve health by supplementing the diet with vitamins, minerals, PUFAs, and other nutrients, and consumers are increasingly preferring natural components over artificial ones. Algae are a unique natural supply of biologically active chemicals, yet they are under-explored. Beta1,3-glucan, a powerful immunological stimulant, free radical scavenger, and blood lipid reduction, appears to be the most essential ingredient in Chlorella (Spolaore et al., 2006). The antibacterial, antiviral, anticancer, and food additive properties of cyanobacteria have long been known (Singh et al., 2005), and drug development is the most potential element of microalgal biotechnology (Spolaore et al., 2006).

Spirulina is a freshwater and saltwater organism. It's a cyanobacterium, a single-celled microorganism that's also known as blue-green algae. Photosynthesis is a process through which cyanobacteria, like plants, may make energy from sunlight. Spirulina was first ingested by the Aztecs, but it gained popularity again after NASA claimed that it might be cultivated in space for astronauts to consume (1). Spirulina is usually taken in dosages of 1–3 grammes per day, however, amounts as high as 10 grammes have been shown to be helpful. The nutrients in this small alga are plentiful. A spoonful of dry spirulina powder (7 grammes) includes:

- Protein: 4 grams
- Vitamin B1 (thiamine): 11% of the RDA
- Vitamin B2 (riboflavin): 15% of the RDA
- Vitamin B3 (niacin): 4% of the RDA
- Copper: 21% of the RDA
- Iron: 11% of the RDA

It also has enough levels of magnesium, potassium, and manganese, as well as trace amounts of nearly all other nutrient you require.

Furthermore, the same quantity has just 20 calorie and 1.7 grammes of digestible carbohydrates. Spirulina may be the most nutrient-dense food on the world, gramme for gramme. Spirulina protein is believed to be of great quality, equivalent to that of eggs. It contains all the necessary amino acids that

Dr. Ashok Rathoure (asokumr@gmail.com)

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

your body need. Spirulina is frequently said to contain vitamin B12, however this is untrue. It contains pseudo vitamin B12, which hasn't been proven to work in people.

Properties

Antioxidant and anti-powerhouse Chronic inflammation, which leads to cancer and other disorders, might be triggered by this damage. Spirulina is high in antioxidants, which defends the body from oxidative damage. Phycocyanin is the principal active ingredient. Spirulina's unusual blue-green hue is due to this antioxidant component. It has the ability to lower bad Low density lipoprotein and triglyceride levels. Cardiovascular disease is the biggest cause of mortality worldwide. A variety of risk factors have been linked to an increased risk of heart disease. Spirulina, it turns out, has a positive impact on a number of these traits. Total cholesterol, bad LDL cholesterol, and triglycerides can all be reduced, while good HDL cholesterol can be increased, for example. Two grams of spirulina each day significantly improved these indicators in a trial of 25 persons with type 2 diabetes. Several additional research have demonstrated that larger dosages of 4.5– 8 grammes per day had beneficial benefits. Oxidation of Bad LDL Cholesterol is prevented. Your body's fatty structures are vulnerable to oxidative damage. This is called as lipid peroxidation, and it is a major cause of a number of severe disorders. The oxidation of bad LDL cholesterol, for example, is a crucial phase in the development of cardiovascular disease. In humans and animals, the antioxidants in microalgae appear to be particularly efficient at reducing lipid peroxidation. 8 grammes of spirulina each day lowered oxidative damage indicators in 37 persons with type 2 diabetes in research. It also raised blood levels of antioxidant enzymes.

The Impact of COVID-19 on the Spirulina Market

Many economies throughout the world have been negatively impacted by the COVID-19 outbreak. Many businesses were badly impacted by government attempts to battle the COVID-19 epidemic, such as statewide lockdowns and quarantines. COVID-19 continues to have an influence on the majority of food manufacturers in the F&B industry. Many businesses have been forced to close across Asia, the United States, Europe, and the entire world due to social alienation, self-isolation, and town lockdowns. Consumer food and beverage producers are facing issues such as decreased demand and disturbed supply networks. The food sector has suffered a modest setback as a result of the trade embargoes implemented by a number of nations. This situation has had a detrimental influence on the confectionery sector since customers are only purchasing the most basic items. Furthermore, government agencies enacted a slew of rules and regulations governing the acquisition of basic items. The majority of customers are just purchasing necessities, which has resulted in a considerable reduction in sweets consumption. According to trade organizations in the nutraceutical industry, there has been a major effect on many locations in the global supply chain for functional foods and supplements, which has lowered spirulina biomass consumption among end-users and impacted the spirulina market's growth.

Humans have long ingested microalgae since Spirulina was gathered from Lake Texcoco and sold in Tenochtitlan markets as early as the sixteenth century (today Mexico City). Microalgae is now being used in a wide range of culinary products. Microalgae is used by the majority of these companies as a marketing technique or as a coloring agent. Spirulina (and chemicals produced from it) has the potential to be employed as components in the production of new functional meals, which is one of the most popular culinary trends. Numerous human intervention studies have shown that Spirulina has the potential to be

BIOMASS

Biomass is indeed the plant material produced by the photosynthetic process of CO2 in the air, water, and sunshine to make carbohydrates, which are the basic building block of biomass. In most cases, photosynthesis transforms less than 1% of available sunlight into chemical energy. The chemical bonds of the building elements of biomass store the sun energy that drives photosynthesis. Carbon is oxidized to generate CO2 and water if biomass is managed effectively, either chemically or biologically, by retrieving the energy contained in chemical bonds and the following 'energy' product mixed with oxygen. Because the co2 is again accessible to generate fresh biomass, the process is circular.

The physicochemical features of the big molecules that make up a specific form of biomass determine its value. For millennia, man has taken use of the energy held in these chemical bonds by igniting biomass as a biofuel and consuming plants for their sugar and starch nutritional content. Fossilized biomass has lately been mined as coal and oil. However, because the conversion of biomass to fossil fuels takes millions of years, they are not renewable on a timescale that humans can use.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Burning fossil fuels turns old biomass into new CO2, contributing to the greenhouse effect and depleting a nonrenewable resource. Because replanting harvested biomass assures that Carbon dioxide is collected and regenerated for a loop of new growth, there is no additional carbon dioxide released into the atmosphere when fresh biomass is burned. The time lag between the initial release of Carbon dioxide from fossil fuel burning and its eventual absorption as biomass, which can take several years, is a significant element that is often disregarded when contemplating the use of biomass to help mitigate global warming. One of the difficulties that the industrialized world faces is the necessity to notice this time lag and take necessary measures to reduce the lag period. A similar issue confronts the developing world, which uses its biomass resources for fuel, but it does not conduct a replacement planting program. For commercial energy farming, a variety of plants have indeed been proposed or are being studied. Woody crops, dwarf varieties crops (all perennial crops), starch and sugar crops, and oilseeds are all potential energy crops.

Biomass: Impact on the Carbon Cycle and Greenhouse Gas Emission

Biomass has the longest history of any source of energy, yet it still delivers enough energy to supply 11% of the world's fundamental energy demands after 44 years. The majority of these are utilized in underdeveloped nations, where low-quality wood is used for cooking and heating, accounting for 38 EJ. The remaining 6 EJ are utilized in industrialized nations for current technology heating and power generating.

Heating was formerly the most popular way of extracting energy from biomass. However, technological advancements have made more efficient and sustainable energy conversion processes possible. Mineral oils may be converted into practically any use using solids, liquids, or gaseous biofuels.

The amount and frequency with which biofuels are utilized varies substantially. In example, biomass provides just 3% of total basic energy demands in industrialized regions, compared to more than 40% in undeveloped countries. Table II demonstrates the range of biomass contributions to energy demands in various nations, ranging from 1 percent in Japan, Ireland, and the Netherlands to 94 percent in Tanzania and Ethiopia. Finland, Sweden, and Austria are among the industrialized nations that get a lot of energy from bioenergy, thanks to the use of wood, wood waste, and grass as fuel.

Biomass Production by Using Microalgae

Microalgae may thrive in a variety of conditions, including clean, saline, and polluted water, and they can even be used to clean. Agricultural, municipal, and industrial wastewater discharge a variety of living and non-living organisms into the environment. These liquid waste streams can be repurposed as fertilizer sources for tiny algae growth systems. The symbiotic interaction between autotrophic growth and heterotrophic/mixotrophic microalgae can aid in improving water treatment efficiency.

This method minimizes carbon dioxide emissions from microalgae biofuels and biogas production technologies while saving power. The extraction of phosphorus and nitrogen from polluted water may be linked with microalgae extraction for the manufacture of biofuels, nutritional supplements, or other bio-based compounds. As a food supply for tiny algae culture while generating bioenergy and high-value bioproducts

Biomass From Forests

Forests cover 38% of EU territory and provide a variety of ecosystem services, including carbon storage and depletion, accommodation, water management (quality, quantity, flow), air quality standards, soil depletion control, and recreation, wood, and non-timber goods. Forest growth differs greatly from that of the rest of the EU in several aspects, including site circumstances, soil, age formation, and species formation (70 percent of forests are made up of two or more tree species).

Forest management functions are driven by forest management principles, EU forestry variety, and the services they may give, impacting the potential supply of woody biomass to fulfil demand for wood-based goods and biofuels. Other elements have an impact on wood's integration inside the EU, which is crucial. Forest ownership is linked to data changes (60 percent of forests are owned by private individuals who are progressively moving to rural regions), forest area division (16 million forestland owners), and the economic advantages of forest management. This chapter focuses on biomass wood from European forests, as well as forest produce and markets. It's worth noting that forest biomass, which includes non-wood forest resources, plays a major role in the bioeconomy of several EU areas region in EU applied in this chapter to summarize forest-based sector data.

Biomass Properties

1. Moisture content
2. Calorific value
3. Proportion of fixed carbon and volatile matter
4. Ash / residue content
5. Alkali metal content
6. Cellulose / lignin ratio
7. Bulk density

Yields

The quantity of dry matter generated by each form of biomass in each production facility affects the available land area's potential manufacturing capacity, or yield. When the crop's production is quantified in dmt/ha and paired with HHV biomass, the crop's energy yield may be estimated. The highest energy output for biomass types.

The use of hybrid plants to increase biomass yields has been the subject of extensive study and development. Psychological tests on mixed popular species yielded 43 dmt / ha / an in in the US Pacific Northwest, and a reported eucalyptus harvest of 39 dmt / ha / an in Brazil (Hislop and Hall, 1996). High dmnt / ha varieties, which are correctly placed in a high-quality agricultural region, e.g., exception, and variety capable of generating high yields of dmt / ha, planted in a separate area, are anticipated to be the two primary types of variations developed for the cultivation of biomass power fields.

Biomass, a traditional third-world source of energy, has the potential to help the developed world reduce the environmental impact of burning fossil fuels to create power, but only if large-scale reforestation projects are implemented quickly. Biomass is a renowned source of renewable energy that is seen as a solution to help reduce global warming by replacing the use of fossil fuels: by 2010, renewable energy sources will provide up to 10% of the UK's electricity consumption.

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

The principal forms of biomass of interest for generating power are woody plants, herbaceous plants, and grasses, with the C. plant species garnering the most attention. Plants store chemical energy in the form of cellulose, hemicellulose, and lignin, with the amounts varying depending on the kind of plant.

TYPE OF BIOMASS

Wood, sawdust, straw, seed debris, compost, paper waste, household trash, polluted water, and other materials are all examples of biomass. The majority of study is currently focused on unfavorable energy and the resulting power. Common fuels will be supplemented by biomass. The primary goal of this study was to examine the research background and biomass styles of renewable energy over the last 40 years (from 1978 to 2018) in order to aid the research community in understanding future trends, as well as the international context and context, all of which provided basic information that helps those in charge of scientific policy make better decisions. The world's population is growing at an alarming rate, with today's population tripling that of 1960 and anticipated to reach 9 billion by 2050. As a result of this condition, the global proportion of energy utilized has increased. Cities have grown significantly. Wood, sawdust, straw, seed debris, compost, paper trash, household waste, polluted water, and other items are all sources of biomass. Biomass resources have been used and are becoming more significant for their economic potential, since there are large yearly quantities of agricultural output, and their products may be used as a source of power and created as energy plants, specifically for this purpose. The main goal of this study was to examine the research environment and practices in biomass renewable energy from 1978 to 2018, in order to aid the research community in understanding the current situation and future trends, as well as the international situation, and to provide basic information to aid decision- making.

The USA, India, China, Germany, and Italy are among the major countries researching on biomass as a renewable energy source, as assessed by scientific output. The Chinese Academy of Sciences is the most productive institution in the sector, followed by the National Renewable Energy Laboratory, Danmarks Tekniske University, and the Chinese Department of Education. In addition, the study identified groups based on published terms discovered through book searches. There were six communities or groups discovered. The two most important ones are concerned with converting biomass to liquid fuel. Finally, eight clusters were established based on international collaboration and biomass research. All of this is focused on three countries that fall into separate categories: the United States, India, and the United Kingdom.

CLASSIFICATION OF BIOMASS

Based on their scope and functions, biomasses can be classified into many classes. There are no specific ways to the classification of biomasses; consequently, we can classify biomasses into several groupings by relying on their magnitude, composition, software, and natural existence. Typically, biomasses can be classified into distinct methods based on the goods, starting location, and characteristic of the biomass. Type can be determined by the types of biomass present in the environment as well as its application as a substrate. Woody biomass, herbaceous biomass, animal and human waste, and aquatic biomass are some of the most well- known classifications of biomass into distinct types.

APPLICATION OF BIOMASS

Every quarter must recognize the three precepts that describe how to reduce, reuse, and recycle environmental waste rather than burning or discarding it. These methods not only aid in the control of all types of pollutants, but they also aid in the reduction of costs, as well as their availability and renewability. Biomass can be used in specialized sectors to meet the waste management hierarchy's requirements for energy, food, fertilizers, and a variety of other items. As the production of biomass increases every day, more appropriate and practical waste control measures are needed to help the ecosystem remain sustainable. Biomass can be used in the energy sector, for bio fertilizer production, for water treatment, In cement manufacturing, for the creation of thermal insulators, and for construction purposes, to name a few applications.

Application of Biomass for Biofuel Production

Biomass is one of the most effective and adaptable substrates for power generation. The provision of natural material, which includes Wood shavings, rice husk, sugarcane, timbers, bushes, leaves, and peanut shells, among other things, is the most important aspect in biomass electricity generation. Biomass is used for power generation in a wide range of applications, from small-scale use in homes for cooking to large-scale use in unique industries, such as boilers and powerhouses. Biofuel is a renewable energy source made from biomass that has been in great demand globally in recent years. One of the advantageous assets is biofuel. Biofuel is a sustainable energy source that helps to reduce air pollution, greenhouse gas emissions, and the reliance on carbon-based energy sources.

Ethanol and biodiesel are the two most common types of biofuels utilized today. Developed countries such as the United Kingdom and the United States rely on the production of bioethanol using marine yeast and seawater as a media. In the year 2019, America generated the most ethanol, Brazil placed second with 8.6 billion gallons, and the United States came in third with 15.8 billion gallons. In the year 2019, 530 million gallons of manufacturing will be produced., India is ranked fifth on this list. Biodiesel is commonly used in conventional diesel engines, either alone or in combination with petroleum diesel. Various feedstocks are used by different countries depending on their availability. The main distinction between ethanol and biodiesel Biodiesel is a type of oil, while ethanol is a type of alcohol. Ethanol is an alcohol made through the fermentation process that can be used instead of or in addition to gasoline, whereas biodiesel is made by extracting naturally existing oils from various flowers and seeds through a process called transesterification. The production of biofuel is targeted not only to meet the needs of decentralized energy generation, but also to meet the needs of shipping. This piques the interest of local organizations and entails the use of local groups' lands for the production of biofuels.

Bioprocessing Involved in Biofuel Production

Bioprocessing is the use of living things and their components, usually after various industrial processes, to produce a product that requires less energy and water and, as an outcome, produces a less affluent issue. Biofuels are a viable alternative to fossil fuels because they are non-poisonous, totally combustible, and environmentally sustainable. The production of biofuels involves a wide range of activities that are generally classified into two categories.: upstream and downstream approaches. Storage of liquid components, removal of inhibitory chemical compounds and particulates from the product, purification

Dr. Ashok Rathoure (asokumr@gmail.com)

and sterilization, and many more procedures are included in the upstream procedures. Storage of liquid components, removal of inhibitory chemical compounds and particulates from the product, purification and sterilization, and many more procedures are included in the upstream procedures. The establishment of a microbial strain with the ability to synthesis the defined business value of a particular product is part of the upstream method. The pressure is then put through an enhanced routine in order to maximize its capacity to create the product at a low cost. Mobile isolation from the fermentation broth, purification and extraction of the desired product, and waste elimination or recycling are all examples of downstream processing. Several steps in fermentation procedure, including appropriate techniques for extracting, purifying, and characterizing the fermentation component in question. In addition to chromatography, a wide range of downstream processing options are available, including centrifugation and filtration. The chemical and physical qualities of the final product, as well as the intended grade, all influence these operations.

CONCLUSION

This study looked at the biomass's structure, composition, and classification, as well as its potential for bioenergy applications. Biomass is a mixture of biological and chemical substances that can be successfully converted into a value-added product. Biomasses can be divided into different divisions based on their applications and future possibilities. However, there are no specific criteria or methods for classifying biomasses, so we can classify biomasses into exceptional companies based on their fine, composition, application, and kind of lifestyles. Biomass can be divided into four distinct categories: woody biomass, herbaceous biomass, animal and human waste, and aquatic biomass. Exploring the relevance of lignocellulosic biomass and its utility over other current biomasses may have the capability in terms of environmental effect, bioprocessing involved in biofuel manufacture, liquid and gaseous biofuels derived from lignocellulosic biomass. The United States leads the way in researching biomass as a renewable energy source, as measured by scientific production, followed by China, India, Germany, and Italy. As a result, large nations with large populations are interested in adopting current renewable energy sources in conjunction with biomass.

Chapter 9
Biofuels From Macroalgae: A Sustainable Alternative to Conventional Energy Resources

ABSTRACT

The steep rise in human population together with the simultaneous growth of urbanization and industrialization has triggered overuse of fossil fuels in the recent years. However, they are non-renewable and release carbon dioxide causing global warming. In this context, biofuels come as excellent substitutes because they are renewable and eco-friendly. They are obtained from biological products and include biodiesel, biomethane, bioethanol, and biohydrogen. They are classified into first, second, and third generation fuels depending on the biological feedstocks being used. Of these, the third-generation fuels, obtained from marine resources like algae, have attracted special research interests because they do not rival the food crop production or depend on land and freshwater for their cultivation. However, the potentialities of macroalgae as a biofuel resource have not been investigated thoroughly. The chapter tries to outline all the aspects of biofuel production from macroalgae pointing out the scopes for future research.

INTRODUCTION

Overexploitation of the fossil fuels and the non-renewable energy resources like coal, petroleum and natural gas in the last few years has not only led to the depletion of resources but has also added carbon dioxide (CO_2) to the atmosphere. Needless to say, CO_2 is a major greenhouse gas (GHG) and causes global warming (Naik et al., 2010). The problem has been projected to rise in the years to come. This necessitates the development of alternative energy sources to meet the growing demands of the burgeoning popula-

tion as well as reduce the adverse environmental effects (Mabee et al., 2005). According to Naik et al. (2010), eco-friendly and sustainable energy resources are the need of the hour for sustainable growth of the economy and industry of a nation. In this regard, several attempts have been taken by researchers to utilize plant biomass and/or organic wastes for extraction of energy. The lipid and carbohydrate contents of these substances have mainly been targeted by hydrolytic degradation, fermentation, pyrolysis and various other techniques to procure the fuels (Gao et al., 2020). They have been termed as 'biofuels' and have emerged as promising alternatives of conventional energy sources. Because of their renewability and sustainability they have been proposed as the 'future energy resources' (Reid et al., 2020). Their extraction from plant derivatives gives an added advantage of maintaining carbon balance in the atmosphere. According to Gao et al. (2020), plants help to sequester atmospheric CO_2 by photosynthesis. As such, burning of the fuels obtained from them does not become an additional source of CO_2 emission. Therefore, biofuels can combat global warming to a large extent (Kumar et al., 2016). Another advantage of biofuel production is its ability to generate new employment opportunities (Stevens & Verhe, 2004).

The biofuels sector is, however, in its stage of infancy because of several issues and challenges associated with their production that need to be addressed before they can be manufactured in large-scales (V. G. S. et al., 2021). The common challenge lies in the development of technological sophistication to extract the biofuels with minimum loses such that the final products do not exceed the price of conventional fuels. Otherwise, it will reduce their marketability (Gao et al., 2020). Currently, this field is being explored by various researchers in different parts of the world. The other problem is the direct confrontation of biofuel production with food resources because they have often been attempted to be derived from crop plants accelerating two pertinent issues – global water crisis and food scarcity (Naik et al., 2010). Land availability for cultivation of these crops is another problem under the current conditions of explosive population growth because of increasing land requirements for human habitation (Naik et al., 2010). Land is also required for augmenting crop production to meet the demands of the expanding population. Adequate freshwater supply is equally important to maintain agricultural productivity. Using freshwater for cultivation of terrestrial plants to be used as feedstock for biofuel manufacture will trigger competition between the biofuel and agricultural industries. These problems have encouraged the researchers to explore non-consumable raw materials (that are not terrestrial derivatives) for biofuel production (V. G. S. et al., 2021). Consequently, the marine resources primarily consisting of the micro and macroalgae have emerged as the preferred candidates for biofuel extraction. Some workers like Liao et al. (2021) have used the term 'blue bioeconomy' to describe the economy dependent on such biofuel resources. They offer several advantages over terrestrial plants the most important being their rich carbohydrate and lipid contents together with low (to almost zero) proportions of lignin facilitating the extraction of biofuels by employing cheaper technologies (Gao et al., 2020). Furthermore, they can be cultivated in unused, rejected or barren lands with saline water and wastewater and can withstand adverse environmental conditions (Gao et al., 2020). Despite these advantages, they have certain drawbacks that have prevented them from gaining popularity. They need further developments both in terms of technology and overcoming certain serious environmental issues associated with their production (Hughes et al., 2012; V. G. S. et al., 2021).

The current chapter tries to give a comprehensive review of the advantages of using macroalgae as the source of biofuels by going through some recent publications in this field. It discusses about the advantages and limitations of microalgae while referring to the potentialities of macroalgae as a biofuel resource. It also highlights about the various challenges and environmental issues of biofuel production

IP Address: 223.238.231.239

from macroalgae that limits their acceptability. Last but not the least, it suggests some mitigation strategies by pointing out the research gaps in this field.

BIOFUEL GENERATIONS

The growing human population and its increasing demands puts severe stress on the fossil fuels that form the primary source of energy. According to V. G. S. et al. (2021), the fossil fuel requirements from 2010 to 2040 will augment by as much as 40%. However, they are non-renewable and tend to get exhausted if proper alternatives are not searched for. Additionally, they are also a cause of global warming, pollution and the emerging issue of global climate change (Biswal, 2021; 2022). These pressing conditions compelled the researchers to develop sustainable, renewable and eco-friendly energy resources time and again. Many workers have used the term 'green fuel' to describe them (Naik et al., 2010). They are primarily formulated from plant sources and depending on the raw materials used they have been classified into three generations.

First Generation Biofuels

Bioethanol, biodiesel and biogas form the three primary types of first generation biofuels. Bioethanol is a good alternative of gasoline and can be used in vehicles that are flexible with fuel use. It can be procured from fermentation of starch or sugars present in the plant biomass (Naik et al., 2010). Bioethanol can also be a source of ethyl tertiary butyl ether (ETBE) that blends well with gasoline. Additionally, vegetable oils together with residual oils and fat obtained from plant sources or wastes can be subjected to transesterification to obtain biodiesel. Another sustainable alternative of gasoline is biogas or biomethane that can be obtained by anaerobic breakdown of liquid manure and other plant sources or waste materials (Naik et al., 2010).

One major drawback of first generation biofuels is their dependency on food crops (e.g. wheat, rice, sugarcane and corn), edible oils and other food stuffs as raw materials. Since the growing population puts increasing demands on food production, utilizing food resources for biofuel production directly threatens the future food security (Naik et al., 2010). Many researchers have also claimed that utilization of food crops for biofuel production may inflate food prices (Gao et al., 2020). This has encouraged the cultivation of crops specially dedicated for biofuel production that can be grown on barren lands. In this context, oilseed crops have gained recognition because they can directly yield biodiesel while their lingnocellulosic biomass can be processed to manufacture second generation biofuels (Naik et al., 2010). However, their production has sparked controversy because they directly involve land use and also exerts negative impacts on biodiversity. Increased land use for fuel crops production has serious issues because increasing human population requires increased land supply for human habitation. Above all, according to many scientists, the production and utilization of first generation biofuels offsets carbon balance with negative impacts on the environment (Naik et al., 2010). Keeping these disadvantages in mind the second generation biofuels were developed.

Dr. Ashok Rathoure (asokumr@gmail.com)

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Second Generation Biofuels

The second generation biofuels use non-food substances, mainly the lingnocellulose materials of plants, as the raw material for fuel production (Zabaniotou et al., 2008). This places them ahead of the first generation biofuels by not competing directly with the food materials. Moreover, the raw materials are abundantly available from plants and are cheap. These fuels are also beneficial in terms of maintenance of CO_2 balance because the plant biomass used as the feedstocks fixed atmospheric CO_2 (by photosynthesis) during their lifetime. Thus, the CO_2 emitted from the ignition of the biofuels derived from them balances, to some extent, the removal and addition of atmospheric CO_2 (Naik et al., 2010). However, their potentialities have not been explored thoroughly despite the plant biomass being an immense source of liquid biofuels. Here, it is worth mentioning that the plant-derived raw material is primarily composed of 75% polysaccharides that make up the cell walls. Degradation of the polysaccharides followed by fermentation and/or gasification can give some important biofuels like bioethanol and biogas (Naik et al., 2010).

Residues from the wood industry (e.g. wood shavings), agriculture (e.g. straw), forestry (e.g. short rotation forestry crops like eucalyptus and willow) and perennial grasses (e.g. *Miscantus* sp.) are the most common sources of feedstocks for second generation biofuel production. It has been proposed that they have the ability to supply a large extent of the increasing demands for liquid fuels (Naik et al., 2010). Apart from the substitute of gasoline (i.e. bioethanol) they can generate FT-diesel (Fischer-Tropsch diesel) and BTL (Biomass-to-Liquids) which can completely replace diesel (Naik et al., 2010). Additionally, Bio-SNG (Synthetic Natural Gas) obtained by gasification of the plant biomass can be an alternative to gasoline but it requires slight modifications. Similarly, Bio-DME (Dimethyl Ether) [obtained from syngas] can be used as a used as a diesel-substitute with certain alterations (Balat, 2007). The syngas can also be transformed into bio-kerosene (Balat, 2007).

One of the greatest disadvantage of second generation biofuels is the cost involved in the technology required for the conversion of the lignocellulosic raw-materials into fuels. As such, the biofuels obtained become pricey compared to their conventional alternatives (V. G. S., et al., 2021). This lack of cost-effectiveness proves a barrier to their acceptability. The drawbacks prompted the development of third generation biofuels with inexpensive, non-consumable and renewable feedstocks that can be easily processed to give cost-effective fuels.

Third Generation Biofuels

Utilization of marine resources in the form of seaweeds and cyanobacteria made the way for greater production of biofuels with lesser investments (V. G. S., et al., 2021). Their non-dependence on agricultural lands and freshwater supplies make them the feedstock of choice for biofuel production (Gajaraj et al., 2018). Marine water, brackish water, saline water and even wastewater, which are unfit for cultivation of agricultural crops, may be used for cultivating most of the non-consumable algae. Animal, industrial and municipal runoffs can also be utilized for growing algae. Additionally, they can withstand adverse climatic conditions and can also be grown in dark using suitable sugar sources in the medium (Gajaraj et al., 2018). This makes their cultivation flexible. Furthermore, the biofuels derived from macroalgae have been found to be secure, recyclable and sulphur-free making them extremely useful alternatives of conventional fuels (Mat Aron et al., 2020).

Dr. Ashok Rathoure (asokumr@gmail.com)

The algae are characterized by rapid rates of growth and high efficiency of fixing atmospheric CO_2 by photosynthetic processes (Peter et al., 2021). The macroalgae mainly consist of approximately 25% to 60% of carbohydrates, 5% to 47% of proteins, 18% to 55% of ash and lipid contents less than 5% (V. G. S., et al., 2021). The biochemical composition, however, varies with the biotic and abiotic factors of the environment where these algae are cultivated (Peter et al., 2021). The seaweeds have high productivity facilitating quicker generation of surplus raw materials for extraction of biofuels. The annual harvest of wet seaweeds across the globe has been recorded at 7.5 to 8 million tons (Subba Rao & Mantri, 2006). According to Jung et al. (2013) the brown algae, kelp (*Saccharina japonica*) and sea mustard (*Undaria pinnatifida*) have the highest productivity per unit area making them one of the best feedstocks for biofuel production. Eventually, the algal biofuels have emerged as promising alternatives to the earlier two generations and have gained popularity as the 'third generation biofuel'.

MACROALGAE AS A SOURCE OF BIOFUELS

The use of algae in biofuel production is recently gaining grounds because of their ability to fix carbon dioxide (CO_2) by photosynthesis. According to Aresta et al. (2005) their photosynthetic efficiency is high and approximately ranges from 6% to 8% whereas it is about 1.8% to 2.2% in biomass derived from terrestrial plants. Additionally, they do not compete with food production as was the case with first generation biofuels (Singh & Olsen, 2011). They are beneficial over second generation biofuels because of their low lignin content saving the cost incurred in its removal (Singh & Olsen, 2011). Poor quality lands, not suitable for crop cultivation, can be easily used for production of algae (Levine et al., 2010). They have rapid growth rates and the ability to utilize the nutrients (like nitrogen and phosphorus) present in wastewater, thereby, contributing to wastewater recycling as well (Singh et al., 2011).

Though both the microalgae and macroalgae have been recognized as prospective sources for biofuels, macroalgae is comparatively new and unexplored giving ample opportunities for research (Mata et al., 2009). The higher lipid contents and faster growth rates of microalgae have made them preferable over macroalgae for biodiesel production but their lower carbohydrate contents do not make them a good source for production of biomethane (Jin et al., 2013). The energy yield of macroalgae is also higher than the same amount of microalgae (Chen et al., 2015). It has been observed that the process of harvesting of macroalgae is simpler than microalgae because of their multicellular nature and plant-like features (Maceiras et al., 2011). The higher and good quality carbohydrates of macroalgae make them a good source of biofuels like bio-oils, bioethanol, and biogas.

There are three major groups of macroalgae depending on their photosynthetic pigments. They are green algae (Chlorophyta), red algae (Rhodophyta) and brown algae (Phaeophyta) (John, 2011; Kraan, 2013). The red algae is the most abundant group in terms of species followed by green algae (Jung et al., 2013). Brown algae has the least number of species compared to the other two and prefers cold water (Jung et al., 2013). Red algae flourish in the inter-tropical zones while the green algae can grow in all water types (Bucholc et al., 2014). Currently, macroalgae is cultivated extensively in Asia mainly as a food source, for production of fertilizers and for extraction of hydrocolloids (Roesijadi, 2010). Japan, Korea, China and Philippines account for approximately 72% of the world's share of macroalgae production (Chen et al., 2015).

Macroalgae has not received much attention for biofuel production but they have garnered industrial interests for extraction of hydrocolloids (Bucholc et al., 2014). Microalgae dominates the biofuel sector

Dr. Ashok Rathoure (asokumr@gmail.com)

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

but their poor carbohydrate contents limit their versatility (Bucholc et al., 2014). The dry matter content of macroalgae amounts to about 10% to 15% and contains as high as 60% of carbohydrates (Roesijadi, 2010). Their cell wall is rich in carbohydrate sources like cellulose and/or starch (Roesijadi, 2010). Interestingly, their biochemical composition shows seasonal variation with the stored carbohydrates reaching its peak value in the autumn season (Kraan, 2013). Some of the major biochemical constituents of macroalgae have been represented in Table 1.

Table 1. Some major biochemical constituents of macroalgae (based on previous reports)

Macroalgae	Carbohydrates	Lipid	Protein	Reference(s)
Chlorophyta				
Ulva lactuca	11.6 to 13.2 (a)	9.6 to 11.4 (a)	11.4 to 12.6 (a)	Becker, 1994; Kaliaperumal et al., 2002; Suganya et al., 2016

The major polysaccharide content of green algae includes starch, cellulose, mannan and ulvan. Red algae are a good source of agar, carrageenan, lignin and cellulose. Alginate, laminarin, mannitol, cellulose and glucan form the primary polysaccharides of brown algae. These polysaccharides differentiate macroalgae from microalgae (Jung et al., 2013). Moreover, the poor lignin content (about 0.03 kg per kg of dry matter) of macroalgae facilitates their fermentation or anaerobic digestion for extraction of biofuels (Horn, 2000). The process becomes much cheaper because additional investments on pretreatments for lignin removal, which forms an integral step for extraction of second generation biofuels, can be avoided (Chen et al., 2015). Apart from the polysaccharides, the macroalgae have high proportions of alkali metals and halogen contents (0.5% to 11%) compared to the biomass obtained from terrestrial plants (1% to 1.5%) (Mautner, 1954). The nutrient contents of the macroalgae [mainly nitrogen (N) and phosphorus (P)] have been found to vary with their morphology as well as the nutrient enrichment of the aquatic medium (McHugh, 2003). The effects of these constituents on biofuel production have been discussed later in this chapter.

BIOFUELS FROM MACROALGAE

The following biofuels can be obtained from macroalgae by application of thermochemical and biochemical technologies.

Biogas

Sea weeds are excellent candidates for biogas production because of their high carbohydrate content with low proportions of cellulose and lignin. As such, they can easily be fermented to obtain biogas (Saqib et al., 2013). The process mainly involves anaerobic breakdown of the organic matters in sea weeds to liberate gases like carbon dioxide, methane and small quantities of hydrogen sulphide. The first step of biogas production involves microbial enzyme mediated hydrolysis of the organic constituents of macroalgae (i.e. proteins, lipids and carbohydrates) into a soluble organic extract which is subsequently treated by acidogenic bacteria. In the second step, the enzymes liberated by acidogenic bacteria trigger the process of acidogenesis resulting in the liberation of alcohols and volatile fatty acids (VFAs). Subsequently, in the third step, the acetogenic bacteria converts the alcohols and VFAs into acetic acid and hydrogen which are finally acted upon by methanogenic bacteria to yield methane and carbon dioxide (Romagnoli et al., 2011).

It is important to note that the high water content (80 to 85%) of macroalgae qualifies them for microbial degradation over the thermochemical processes. However, the production of biogas from macroalgae is not free from challenges. High nitrogen content of macroalgae inhibits the action of the microbes and generates excessive ammonia which is toxic to the methanogenic bacteria (Demirbas, 2010). The presence of alkaline metals also hinders the anaerobic digestion processes. Additionally their cell walls need to be broken down by physical or chemical pretreatments to access the organic matter during biogas production (Demirbas, 2010). This problem is usually overcome by co-digesting the algal biomass with a substrate having high C:N (Carbon:Nitrogen) ratios such as straw or waste paper (Yen & Brune, 2007; Vivekanand et al., 2012). Some common macroalgae utilized for biogas production and their yields have been shown in Table 2.

[TRS - Total Reducing Sugars, VS – Volatile Solids, TS – Total Solids, COD – Chemical Oxygen Demand]

Bioethanol

Bioethanol is an example of liquid algal transportation fuel. Its production from algal biomass is facilitated by the presence of low proportions of hemicelluloses and lignin (Mutripah et al., 2014). Fermentation of algal biomass (e.g. with the yeast, *Brettanomyces custersii*) has been extensively explored for bioethanol production (Park et al., 2012). However, the algal biomass requires pre-treatments to enable the enzymes to act on the algal carbohydrates like carrageenan, laminarin and alginate (Wei et al., 2013; Chen et al., 2015). Pretreatment with acids like sulphuric acid (H_2SO_4) or hydrochloric acid (HCl) is most commonly employed for this purpose which facilitates the hydrolysis of structural polysaccharides (Han et al., 2007). Even though the process of acid hydrolysis is cheap, it generates by-products like

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

levulinic acid and 5-hydroxy-methyl-furfural which impedes ethanol production (Klinke et al., 2004; Jeong et al., 2012). Enzymatic hydrolysis is a suitable alternative and at times essential. For example, digestion of laminarin (present in brown algae) requires enzymatic treatment with laminarinases (Lee et al., 2014). Similarly, cellulase enzyme is used to digest cellulose present in algal biomass (Singh & Trivedi, 2013). However, enzymatic hydrolysis is not a preferred method because it is very slow (Tan et al., 2013). Instead, a combined pretreatment method utilizing acids and enzymes has been found to be very productive (Daroch et al., 2013). Pretreatment using gamma radiation has also been found to be a sustainable method (Yoon et al., 2012). Interestingly, sea weeds like *Ulva pertusa* and *Gelidium elegans* are free from lignin and do not require any pretreatment (Yanagisawa et al., 2011).

Currently, the bacterium, *Zymomonas mobilis* and the yeast, *Saccharomyces cerevisiae* have gained popularity as the fermenting microorganisms for production of bioethanol (Horn et al., 2000). However, fermentative degradation of certain polysaccharides like mannitol requires the presence of oxygen. In these cases, the bacterium, *Zymobacter palmae* have been found to be very effective (Horn et al., 2000). Thus, the basic process of bioethanol production involves hydrolytic degradation of the algal polysaccharides into simple sugars followed by their fermentation to ethanol and separation by distillation in the final step. Examples of macroalgae commonly used for the production of bioethanol and their yields have been represented in Table 2.

Biodiesel

Biodiesel consists of a blend of monoalkyl esters of long chain fatty acids and can be used directly for running diesel engines (Demirbas, 2009). They can be derived from commercially obtained triglycerides from plant oils, animal fats and vegetables by subjecting them to transesterification reactions (Chen et al., 2015). However, the macroalgae have poorer lipid contents compared to microalgae resulting in lower yields of biodiesel. This makes microalgae, with oil productivity higher than the high yielding terrestrial oil crops, a raw material of choice for biodiesel production (Afify et al., 2010; Maceiras et al., 2011). Nevertheless, the macroalgal biomass can be converted into bio-oil consisting of a mixture of free fatty acids and lipids. The lipids can then be isolated and utilized in biodiesel production. Some common macroalgae used for biodiesel production and their yields have been enlisted in Table 2. The existence of large amounts of free fatty acids in bio-oil is, however, reported to hamper biodiesel production (Chen et al., 2015). Conversion of free fatty acids from algal oil into biodiesel has been attempted by Suganya and Renganathan (2014). Alternatively, glucose obtained from macroalgae (e.g. *Cladophora glomerata*) can be converted into free fatty acids followed by biodiesel production (Chen et al., 2015). In yet another method, the macroalgal biomass can be acted upon by oleaginous yeast to produce biodiesel while the free fatty acids obtained as the by-product could serve to nourish the yeast itself (Xu et al., 2014).

Proper dehydration of the algal biomass is essential prior to biodiesel production because presence of water lowers its yield by as much as ten times (Daroch et al., 2013). The algal biomass can then be mechanically compressed to extract the bio-oil though it is a time-consuming process and not much effective (Popoola & Yangomodou, 2006). Using organic solvents like hexane, acetone, benzene, chloroform, etc. to extract oils from algal biomass have been found to be more productive than the mechanical process (Topare et al., 2011). The extracted oil is then subjected to transesterification reaction using alcohols like butanol, propanol, ethanol, methanol, etc. However, use of methanol and ethanol is more preferred because they are cheaper and offer certain chemical and physical advantages over others (Surendhiran & Vijay, 2012). Presence of lipase enzyme or inorganic catalytic agents like acids and alkalis are equally essential

for biodiesel production (Meher et al., 2006). Glycerol is an important by-product in these reactions and has to be removed from the reactor on a regular basis to prevent engine failure (Munir et al., 2013).

Biohydrogen

Electricity may be generated from the biohydrogen procured from algal biomass. It may also be used as a gaseous fuel (Behera et al., 2015). Photo fermentation and biophotolysis are two common methods for biohydrogen production (Shaishav et al., 2013). The red alga, *Gelidium amansii* can be anaerobically fermented to obtain biohydrogen (Park et al., 2011). However, the yield depends on adopting suitable pretreatment methods because acid hydrolysis of the algal biomass can produce 5-hydroxymethylfurfural which inhibits the production process reducing the output by almost 50% (Park et al., 2011). Dark fermentation of the fermentable sugars obtained from macroalgae by using mesophilic and thermophilic microbes has also been suggested as a suitable technique of biohydrogen production (Kumar et al., 2016). Furthermore, the carbohydrate content of the algae can be maximised by exposing them to stressed conditions during their cultivation. This can increase their biohydrogen yields (Kumar et al., 2016).

Heat treatment of the brown seaweed, *Laminaria japonica* at 170°C can produce hydrogen at the rate of 109.6 mL/g COD (Chemical Oxygen Demand) (Jung et al., 2011). Microwave pretreatment of *Laminaria japonica* at 160°C for about half an hour also gives good result (Yin et al., 2019). Macroalgae, on being treated with hydrogen peroxide, gives a good supply of hydrogen as well (Roy et al., 2014). Additionally, water can be subjected to biophytolysis using the photosynthetic properties of microalgae (Kumar et al., 2016). Table 2 represents some common macroalgal species from which biohydrogen can be obtained and their yields.

CHALLENGES OF BIOFUEL PRODUCTION

One of the greatest challenges of using terrestrial plants and/or their derivatives for biofuel production is the consumption of freshwater because many parts of the world are already facing challenges of potable water supply (Shilton & Guieysse, 2010). Under the growing negative impacts of climate change and non-sustainable anthropogenic activities, future availability of freshwater has already raised several questions (Biswal, 2021; 2022). These were the circumstances that prompted researchers to exploit the marine resources for generation of biofuels. Of the marine resources, the microalgae has been extensively experimented as biofuel producers (Behera et al., 2015). Their faster proliferating capabilities, high proportion of polyunsaturated fatty acids (often exceeding by almost 80% of their dry weight) and almost no lignin content make them highly efficient raw materials for generation of biodiesel (Mata et al., 2009; Jin et al., 2013). However, they are poorer in carbohydrates (compared to the macroalgae) restricting their versatility in biofuel manufacture (Chen et al., 2015). Their cultivation also has several constraints like availability of long periods of sunlight encouraging the use of photo bioreactors as an alternative. However, they did not gain acceptance because of the costs involved inflating the prices of the final product (Wilcox, 1977). The macroalgae, on the other hand, gives a good yield of biogas when their biomass is subjected to gasification (Wargacki et al., 2012).

At present, more than one hundred species of macroalgae are being used for commercial purposes (like pharmaceutical products, food and fertilisers) all over the world (Santelices, 2007). Knowledge regarding the life cycle of sea weeds and their cultivation in large-scales gained momentum in the twentieth

century. It was China who first began to selectively breed sea weeds (beginning with *Laminaria* sp.) in the 1960s (Hughes et al., 2012). However, research shows that not even 1% of the available macroalgae have been explored properly (Budarin et al., 2011). They are good sources of bioethanol too (Hughes et al., 2012). Despite their potentialities, large-scale manufacture has not gained popularity because of the consequences on marine ecosystem due to their mass harvest (Springer et al., 2010; Kraan, 2013). It is to be remembered that the macroalgae, though non-consumable for humans, forms a support system for the marine environment. For instance, they have been found to grow profusely in the regions near the corals sheltering a variety of organisms together with the fishes and birds (Lorentsen et al., 2010). Massive harvesting of the seaweeds is also not eco-friendly because they take time to bounce back to their original conditions (Christie et al., 1998).

Cultivation of macroalgae can be carried out both offshore and onshore by several techniques. In the offshore methods, the lagoons are preferred for their growth and harvest while their onshore cultivation is operated along the coastal belts (V. G. S. et al., 2021). Comparison between both the cultivation techniques shows that offshore cultivation is more difficult and not sustainable (Hughes et al., 2012; V. G. S. et al., 2021). Hughes et al. (2012) have mentioned several environmental threats associated with large-scale cultivation of macroalgae in the marine environment (i.e. onshore cultivation). Since they grow in the water column just above the sea floor (also referred to as the seabed) they may severely impact the benthic flora and fauna. They may block the sunlight from penetrating deeper waters affecting the autotrophic organisms as well as competing with them for nutrients (Hughes et al., 2012). Sometimes inorganic fertilizers [e.g. nitrogen (N) and phosphorus (P)] are used to boost algae production which may lead to nutrient enrichment of marine waters and subsequent algal blooms. As such, the ecosystem along the coastline may be disrupted due to conditions of oxygen stress caused by algal overgrowth (Herbert, 1999; Springer et al., 2010). It may also result in terrestrial nutrient runoffs to the seabed beyond the photic zone resulting in nutrient enrichment of deep sea waters. This may make their habitats complicated. Accidental tearing or shredding of the macroalgae during their cultivation can create zones of organic enrichment (Cromey et al., 2009). The outcomes of these effects on marine organisms (e.g. cetaceans, fishes, etc.) have not been studied extensively raising doubts on the environmental impacts of macroalgae cultivation in the long run (Hughes et al., 2012). Despite the ability of the macroalgae to remove inorganic carbon from sea waters, a minor fraction may get converted to particulate organic matters and get settled on the sea floor with environmental consequences (Lüning & Pang, 2003). Several workers have pointed out that onshore cultivation often lowers the quality of the algae rendering them inappropriate for the chemical, pharmaceutical and the cosmetics industry (Hafting et al., 2015). This is due to lack of standardization and adoption of cost-effective sustainable strategies for macroalgal cultivation on large-scales (Hafting et al., 2015). Large-scale cultivation of seaweeds can affect the sedimentation patterns causing alterations in the local hydrodynamics (Hughes et al., 2012). However, according to some workers macroalgae cultivation in large-scales can enhance local biodiversity (Frank et al., 2012). Another important point that needs to be considered for biofuel extraction from macroalgae is the cost involved in their harvest and transportation to the factories. Since the seaweeds have a scattered distribution along the coasts the processes are quite expensive inflating the production costs of biofuels (Hughes et al., 2012).

Manufacture of biofuels require a steady supply of algal biomass which is difficult to manage because of the challenges involved in growing and harvesting of macroalgae. Since the bio-products obtained vary with the algal species (due to differences in their polysaccharide contents) the sorting process during biofuel manufacture becomes all the more complicated (V. G. S., et al., 2021). Further, the choice

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

of the microbes for fermentation of the plant biomass is also an important and challenging task because the efficiency of the microbes differ with the raw materials and the conditions of reaction (V. G. S., et al., 2021). Pretreatment of the plant biomass is essential for maximum utilization of the polysaccharides in plant tissue. Therefore, this part also requires sufficient development to maximize the product output since many pre-treatment procedures may cause reduced outputs. Another major obstacle is the freshwater requirement in the bioprocessing stages which may augment the shortage of freshwater supplies in the future (Liao et al., 2021). Though seawater can be used in the hydrolysis and fractionation stages of macroalgae as well bioethanol production, their applicability on large-scales is still being worked upon (Joniver et al., 2021).

Often, the biochemical constituents of the macroalgae themselves hamper biofuel production. For instance, mixed sugar composition of the macroalgae decreases their efficiency as a biofuel source (Park et al., 2012). Additionally, the presence of large quantities minerals like calcium (Ca), magnesium (Mg), potassium (K) and sodium (Na) often inhibit the production of biofuels (Repérez, 2002). Apart from these, their pyrolysis for production of hydrocarbons, phenols, ketones, furanes, etc. involves huge energy expenditures adding to the production cost (Yanik et al., 2013). Keeping these constraints in mind, researchers from around the world are trying to develop this field by their continuous efforts (Bošnjaković & Sinaga, 2020; Fabris et al., 2020).

From the foregoing discussion it appears that besides technical challenges there are several environmental issues which contradict their claim of being eco-friendly. One more issue that often escapes observation is the role of geo-climatic conditions on the growth of macroalgae. It is well known that the geographical distribution of seaweeds largely depends on the prevalent climatic conditions. For instance, the red alga, *Porphyra* sp. grows commonly in Japan while the brown alga, *Laminaria japonica* is popular in China (Giugni & Giugni, 2010; Lam & Lee, 2019). This makes their distribution vulnerable under the effects of global climate change and will severely impact the location of the biorefineries (Zhou et al., 2010). The sustainability of bioeconomy also becomes a matter of doubt in the future (Zhou et al., 2010). Extinction of algal species or emergence of new invasive ones under the effect of climatic stress factors will require continuous research and developments in this field which will add to their production costs (Khan et al., 2018). According to experts, this augments the unpredictability of seaweeds which will affect the employment opportunities of the biofuels sector and availability of skilled labour because it will no longer remain a stable source of income. Indirectly, this will have strong impacts on biofuel production (V. G. S., et al., 2021). Furthermore, the environmental impacts of biorefinery construction along the ocean shores need to be thoroughly investigated to know their impacts in the future (V. G. S., et al., 2021).

FUTURE PERSPECTIVES

The biofuel sector is naïve and requires sufficient improvisation to increase their yields with lower investments. This provides several research opportunities in this area of which the environmental issues need to be properly addressed. Some current publications in this field show that the environmental issues that are discussed are mainly the ones involved with their direct combustion. Those related to macroalgae cultivation have, however, been poorly explored. This needs extensive research because of the proposed negative impacts on the marine ecosystem in the long run. Suitable mitigation strategies should be undertaken to resolve the issues failing which the sector will not only lose its sustainability but

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

also its affirmation of being eco-friendly substitutes of conventional fuels. Regarding the technological advancements, importance should be given to the development of cost-effective techniques to make the biofuels cheap and readily available. This should not, however, compromise with their efficiency since that may restrict their applicability. The biofuel industry has a huge scope for recycling the wastewater by utilizing them in the cultivation of algae. Considering the growing amounts of wastewater production in the recent years, with increased urbanization and industrialization, developments in this sector can mitigate the problem of wastewater disposal as well.

CONCLUSION

Biofuels have tremendous potentialities to replace the conventional non-renewable energy resources and combat the production of greenhouse gases. This can not only solve the problem of future threats of energy availability but can also address the problem of global climate change. In this regard, the high carbohydrate contents and low proportions of lignin in macroalgae make them efficient sources of biofuels like bioethanol, biogas and biohydrogen. Biodiesel can also be extracted from macroalgae but microalgae gives better yield because of their higher content of unsaturated fatty acids compared to macroalgae. It is the versatility of macroalgae in terms of biofuel production that they are being considered to be more prospective biofuel source in the future. However, there are certain challenges, both technical and environmental, concerning their cultivation and biofuel extraction which have hindered their production in large-scales. Moreover, they have not been as extensively studied as the microalgae. Since, this sector is still in its developmental stages it gives ample opportunity for research. Resolution of the issues in this field can make macroalgae-derived biofuels one of the most promising alternative energy source in the future.

ABSTRACT

Natural gas hydrate (NGH) has emerged as a future source of energy for the world that can fulfill the future energy demand. The natural gas hydrates hold twice the amount of energy than all available fossil fuels. At present, the energy demand is growing, but these are not available commercially. Various field applications on the dissociation of the natural gas hydrates have been performed till now, and the output of these field applications confirms the possibility of dissociation of the natural gas hydrates. At distinct locations in the world, the huge deposits of hydrates have been identified, but the safe and economic dissociation of gas hydrates is not known yet. Hence, the evolution of new and inexpensive, suitable methods and technologies are required for the dissociation of gas hydrates. In this chapter, the authors reviewed several articles to compare the different dissociation techniques of gas hydrates and their field applications. The advantages and disadvantages of these production methods have also been discussed.

INTRODUCTION

Gas hydrates are non-stoichiometric solid formed naturally by the entrapment of gas within the crystal structure of water molecules. When water molecules entrap gas molecules at high pressure and low temperature, then create the cage-like structure of gas hydrates. It is also called combustible gas because it can be burned at ambient temperature and pressure. Gas hydrates can be formed by methane, ethane,

hydrogen sulfide, carbon dioxide, nitrogen, propane, isobutane, n-butane, etc (Gabitto and Tsouris 2010). At equilibrium conditions, $1m^3$ of natural gas hydrates contain 160-180 m^3 of natural gas (Li et al. 2011). Naturally, the methane gas hydrates are made by combining the water and the methane gas released either by organic decomposition or by thermogenic gas leaking beneath the sea level or permafrost region (Zhou et al. 2009). The natural deposits of gas hydrates are classified as Class 1, 2, and 3 types of reservoirs. The Class 1 type of hydrate deposits are consisting of a layer of hydrate and an underlying free gas zone. The Class 2 deposits are consisting of a layer of hydrate and an underlying mobile water zone. The Class 3 type hydrate deposits are created with an isolated layer of hydrate with no underlying zone of free gas or mobile water. In Class 3 deposits, the whole layer of hydrates is in the stability zone and enclosed by the impermeable lower and upper burden layer (Huang et al. 2016).

Sir Humphrey Davy discovered the gas hydrates for the first time in 1810, but there is also a possibility that Priestley found it in 1778 (Sloan and Koh 1998). Natural gas hydrates can be found in the high altitudes/latitudes of permafrost or in the sediment layers, which occurs in deep water on the continental margins (Kvenvolden 1998; Kvenvolden and Rogers 2005). Small parts of red lakes, i.e., the continental land, seas of the Caspian Sea, Lake Baikal, and the Black Sea, also contain natural gas hydrates. These reserves were discovered in mountain permafrost regions or deep water, such as South China Sea, the Gulf of Mexico, Indian Ocean, Siberia, Arctic Alaska, multiple areas of Qilian and Mainland China (Ginsburg et al.1992; Ginsburg and Soloviev 1994; Lu et al. 2011). The curiosity for scientific research in gas hydrates increased exponentially when it became responsible for the blockage in oil and gas pipelines. Hence various research studies are in progress for the dissociation of the gas hydrates because it can solve the crisis of energy in the future and then become a potential source of energy in the world (Koh et al. 2009). Currently, the available methods for decomposing gas hydrates are chemical injection, depressurization and thermal stimulation (Kumari et al. 2020).

There is a need to find the cost-effective technologies for the economic dissociation of the gas hydrates, and the rate of dissociation will control this economic production of gas. Figure 1 depicts the available dissociation techniques of gas hydrates. Table 1 listed the list of some patents filed on new dissociation techniques of gas hydrates.

Table 1. List of some Patents filed on New Techniques for the dissociation of gas hydrate.

Assignee	Description of Patent	References
Mobil Oil Corporation, Fairfax, VA (US)	Electromagnetic radiation can be applied for the recovery of gas from the gas hydrates.	(Heinemann et al. 2001)
ConocoPhilips Company, Houston, TX(US)	The substitution of the gas has formed a more stable hydrate structure with the releasing agent without melting the gas hydrates.	(Graue et al. 2007)
New Mexico Tech Research Foundation, Socorr, N.M.	Apparatus and methods for the transportation, generation, and the dissociation of hydrates	(Guo et al. 1995)
ConocoPhilips Company, Houston, TX(US)	By the application of electromagnetic radiation, methane can be recovered.	(Singhe 2013)
The University of Tulsa, Tulsa, OK (US)	The electric heater was used in the opening of hydrate rich subset sediment, and then the released gas is collected in an overhead receiver.	(Zhang et al. 2009)
Chevron U.S.A. Inc., San Ramon, CA (US)	A two-stage method has been employed to produce fluids from a Class 3 reservoir.	(Gullapalli et al. 2009)
Halliburton Energy Services, Inc., s s Duncan, Okla.	The method or the decomposition of hydrates is to combine the acidic liquid with basic liquid to form an exothermic chemical reaction and form a salt solution.	(Chatterji and Griffith 1998)

The main objective of this chapter is to review the various dissociation methods available for gas hydrates and compare them based on different parameters such as cost, suitability for the environment, and stability conditions. We also compare these methods by focusing on their importance and problems that arise by using them and investigated the stability parameters, i.e., temperature and pressure on which gas is dissociated. We will highlight the drawbacks of various dissociation techniques and introduce some new methods, which can be used. Also studied the implementation conditions for these methods. Finally, a section of conclusions, final remarks, comparisons, issues, and directions for future research has been discussed for all dissociation techniques of gas hydrates.

THERMAL STIMULATION

In the thermal stimulation dissociation method, the gas hydrate is dissociated into water and gas after an increase in the local temperature of the gas hydrates system. The increase in temperature will disturb the stability condition of the gas hydrate system (Fitzgerald and Castaldi 2013). Hydrate is dissociated due to the in-situ heat developed in the hydrate reservoir. The thermal energy has been provided by injecting hot fluids like brine, water, or steam from the upper surface or maybe by downhole processes like electromagnetic heating and electric or in situ combustion (Ning et al.2010). Various novel ideas have been developed due to the relatively high rate of production of gas, such as fire flooding, nuclear waste burial, electromagnetic heating, microwaves (Shashkov et al. 2012), downhole combustion (Castaldi et al. 2007). Still, these methods have not been used for field testing till now. The main technological challenges in the thermal simulation method are the thermal properties of the sediments and the self-preservation phenomena of gas hydrates. The heat transfer during the thermal stimulation method is characterized by thermal conductivity mainly, and the thermal conductivity of hydrates will increase by the presence of minerals in sediments. The drawback of this method is the self-preservation of ice

around the hydrate after the dissociation below the freezing point of ice. The water extracted after the dissociation of gas hydrate can again form the ice because of the endothermic heat of dissociation and prevent further hydrate dissociation (Handa 1986; Shimada et al. 2005; Chong et al. 2016). Su et al. 2012 examined the production potential of the Huff and puff technique for the production of gas in the Shenu area on the northern continental slope of south China sea. They dissociated hydrate by producing fluids and injecting hot water alternatively. They suggested that the huff and puff technique through a vertical wall is not favorable and has not industrial potential (Su et al. 2012). Ning et al. 2010 proposed a technique to use renewable solar energy to provide energy for the dissociation of marine gas hydrates with the thermal stimulation method. In the first step, the conversion of solar energy to electric energy has proceeded. Then heat energy has been created by operating the downhole heaters such as electromagnetic waves and the microwave heaters (Ning et al. 2010). Yang et al. 2010 investigated the efficiency of the single well hot water cyclic injection method to recover the gas from methane hydrate-bearing sand. In this method, the overall temperature enhances with the injection of hot water and reduces with the production of gas. This technique is favorable for the hydrate with low permeability and high saturation (Yang et al. 2010). Phirani and Mohanty 2009 suggested that the injection temperature (323 K), pressure (2 & 4 MPa), and production pressure take an important part for the hydrate reservoirs of confined class 2 type. They concluded that when the pressure and the injection temperature of the production well are high, then warm water flooding is more suitable than depressurization (Phirani and Mohanty 2009). Castaldi et al. 2007 suggested that the downhole combustion technique is very energy efficient for gas production. This method uses local source of heat in the hydrate reservoir (Castaldi et al. 2007). Li et al. 2013 designed a three-dimensional pressure vessel to predict the dissociation of methane gas hydrate by steam-assisted gravity drainage method with different rates of injection of steam (Li et al. 2013). Kawamura et.al 2007 experimented with the steam injection to examine the thermal control system on the artificial sediment with and without methane hydrate. Approximately 44% of the hydrate origin gas was dissociated after the injection of steam (Kawamura et al. 2007). Sakamoto et.al. 2004 developed a special type of apparatus and experimented with showing the physical phenomena and production behavior of gas from hydrates by the injection of hot water. The production of gas from hydrate increases with time (Sakamoto et al. 2004). Sasaki, et al. 2007 proposed a novel system for the recovery of gas from methane gas hydrates layers by injecting hot water by manufacturing dual horizontal wells. The production rate of gas increases with the rate of hot water injection and the absolute permeability (Sasaki et al. 2007). Cranganu 2009 proposed that instead of using hot fluid injection from the surface, an air or gas fuel mixture can be injected into the combustion vessel from the upper surface and then into the gas hydrate zone directly (Cranganu 2009). Li et al. 2008 examined the dissociation behavior of gas hydrate using hot brine stimulation. With the doses of brine in the vessel, the dissociation of hydrate accompanied the decrease in temperature (Li et al. 2008).

The interaction characteristics between electromagnetic waves and disperse systems, the high-frequency energy, and microwave electromagnetic fields can be used to decompose gas hydrates (Fatykhov and Bagautdinov 2005). A heat source has been generated because of the interaction between high-frequency electromagnetic radiation and medium, and the energy of propagating electromagnetic wave converges to heat. This heat source distributed over the gas hydrate volume, and then phase transition occurs in the absence of temperature gradient. In the case of large zones of phase transition can occur, due to which the decomposition temperature of gas hydrate is attained, and the energy of the electromagnetic field has been extended to the dissociation of gas hydrates (Nasyrov et al. 1997). Islam 1994 proposed a new production technique for producing natural gas from Alaskan north slope reservoirs by using electro-

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

magnetic heating with the vertical and horizontal wells. They also concluded that the porosity and the thickness of the gas hydrate reservoir are essential factors for the determination of the total amount of recovered gas (Islam 1994). Rahim et al. 2015 suggested that the plasma decomposition rate of methane to hydrogen production is faster than the methane hydrate decomposition by the microwave plasma method (Rahim et al. 2015). Liang et al. 2009 discovered that the decomposition rate is higher for the high power of microwave. However, a heat efficiency problem is raised as the temperature of the system increases. The temperature difference in the system resulted from the difference of dielectric properties of components (Liang et al. 2009). He et al. 2011 observed the decomposition behavior of gas hydrate in the unconsolidated sediment. They concluded that the sediment could supply an adequate amount of heat for decomposition, then the rate of hydrate decomposition is controlled by the intrinsic kinetics (He et al. 2011). Zhao et al. 2016 examined the dissociation of methane gas hydrates formed in the sediment by applying microwave stimulation (Zhao et al. 2016). Amit Arora 2015 proposed dissociation techniques of the gas hydrate by using microwaves (Amit Arora 2015).

Depressurization

This method is the first production method that has been applied outside the laboratory. The stability of gas hydrates is disturbed by exposing the hydrates to a low-pressure domain where the hydrates become unstable and then dissociated into water and gas. The released gas can be recovered by applying conventional technology (Ji et al. 2001; Moridis et al. 2005; Tsypkin 2005; Tang et al. 2007; Demirbas 2010a). The depressurization method is most favorable for those natural deposits where inescapable gas is found in a closure that forms the hydrate cap above it (Max and Cruickshank 1999). A well is extended and drilled into the hydrate layer and formed in the zone of free gas. The dissociated gas from this hydrate layer causes a reduction in pressure and then dissociation of the hydrate. The dissociation of hydrates in the Messoyakha fields has been done by the depressurization method (Makogon et al. 2007; Makogon 2010). There is no need for expensive continuous stimulation for the depressurization method. Hence it is an effective method for future gas hydrate dissociation et al. 2010).

Different methods have been suggested for the economic development of hydrates as an unconventional source of gas (Sawyer et al. 2000; Goel et al. 2001). The dissociation of free gas using traditional techniques generates a pressure drop. The hydrate becomes unstable because of this pressure drop and dissociates gas hydrates into the water and free gas. Three mechanisms involved in this method are dissociation, heat transfer with convection and conduction, and flow of water and gas (Goel et al. 2001; Kawamura et al. 2003). The most economical method for the dissociation of hydrates is depressurization because an external source of energy is not needed in this method as compared to other methods. But the drawback is that this method has a lower production rate due to slow reaction for the dissociation (Lee et al. 2010). In the depressurization method, the in-situ permeability or free gas fraction will affect the gas production rate. The depressurization method induced dissociation is limited by heat transfer and mass transfer, and free gas saturation is the critical factor for establishing the feasibility of gas production from marine deposits. The gas production at low pressure is fast compared to gas production at high pressure (Chong et al. 2016). Commercially this technique was used by the USSR to dissociate gas from gas hydrates in the Messoyakha field (Makogon 1997b). Kono et al. 2002 analyzed the rate of dissociation of methane gas hydrate using depressurization and also concluded that the properties of sediments could control the rate (Kono et al. 2002). Haligva et al. 2010 analyzed the decomposition of silica sand particle hydrate by depressurization method (Haligva et al. 2010). Ji et al. 2001 found out that the pro-

IP Address: 223.238.231.239

duction rate of natural gas from a reservoir depends on well pressure, the reservoir's temperature, and the permeability of the reservoir zone (Ji et al. 2001). Kim et.al 2013 experimented on pressure cores, which were recovered from holes of UBGH (Ulleung Basin Gas Hydrate) (Kim et.al 2013). Moridis and Sloan 2007 evaluated gas recovery's potential from low saturation and dispersed hydrate formed in oceanic sediments. They also estimated the rate of gas and water production (Moridis and Sloan 2007). Lee et al. 2010 developed an experimental equipment to observe the dissociation behavior of gas hydrate in the porous rock (Lee et al. 2010). The depressurization technique was applied for field testing in Nankai Trough of Japan using two producer wells (Yu et al. 2019).

CHEMICAL INJECTION

In the chemical injection method, the equilibrium condition of hydrates must be displaced by the injection of liquid inhibitor or chemical towards the high pressure and low temperatures. This technique is also expensive, but it is less costly than thermal stimulation (Demirbas 2010a). The main factors to be considered in the chemical injection method are the concentration and temperature of chemicals, rate of injection of chemicals, pressure, and the interfacial area between hydrate and chemical. The heat of dissociation will be decreased after the chemical injection (Fan et al. 2006; Chong et al. 2016).

Table 2. List of Studies on Gas Production from Gas Hydrates by Chemical Injection Method

S.No	Description	Chemical	Advantages	Disadvantages	References
1	Hydrate saturation affects the onset time, but it has less effect on the decomposition rate. The factors, which were considered in this study, are injection rate and saturation.	N2	An optimum N2 injection rate enhances the economic benefits. The N2 injection method is advisable for the exploitation of low hydrate saturation, and it is more advantageous than depressurization.	They did not consider the effects of deposit conditions of hydrates on dissociation by N2 injection.	(Zhang et al. 2017)
2	They analyzed the effect of brine salinity and recovery characteristics of gas from the injection of various concentrations of brine.	Brine	Permeability is an essential factor in determining the production of gas from hydrates. At a low concentration of brine, gas production is excessively high.	There is a significant reduction in the rate of production of gas because of the high concentration of brine.	(Lee 2010)
3	Experimented with the gas recovery from methane gas hydrate in the porous sediment by applying the different rate of injection of ethylene glycol and concentration in a one-dimensional experimental machine	Ethylene Glycol	The efficiency of gas production is disturbed by the concentration of chemicals and the rate of injection, and at last, it attains a maximum value.		(Li et al. 2007)
4	Conducted the dissociation experiment to synthesize the gas hydrate by adding ethylene glycol as an inhibitor in the reaction vessel	Ethylene Glycol	This study has importance not only for natural gas hydrate development but also for transportation and natural gas production.		(Fan et al. 2006)
5	Developed the model to observe the production behavior from the injection of methanol and combined the depressurization mechanism.	Methanol	They prove that the methanol content is the most sensitive parameter for the time taken for the complete dissociation of the well block.	When the injection is done after high production time, the injection effect is not expected to be much during the production.	(Sung et al. 2002)
6	Examined the characteristics of the dissociation process of the hydrate.	Ethylene Glycol and Methanol and	Include the effect of inhibitors on hydrate formation in the natural gas processing, transportation, and natural gas production.		(Sira et al. 1990)
7	Examined the dissociation behavior of artificially created hydrate core samples using an aqueous inhibitor solution.	Methanol	The advantage of an inhibitor was higher at low temperatures.	Gas production behavior at a temperature lower than 19°C has not been investigated.	(Kawamura et al. 2006)
8	Investigated the dissociation behavior of methane hydrates in ethylene glycol solution and silicone oil.	Ethylene Glycol and Silicone oil	Ethylene glycol solution helps motivate the dissociation process when required during the process, and silicone oil is favorable for the transportation of slurry and storage systems.	Silicone oil is not helpful for the dissociation of methane gas hydrate.	(Kawamura et al. 2003)

IP Address: 223.238.231.239

In this method, various chemicals, for example, glycerin, methanol, glycol, and ethanol, are injected, which shifted the thermodynamic equilibrium stability curve of hydrates. The above techniques have been applied only in permafrost areas and till now have not been used in the dissociation of gas hydrates of marine areas (Williams et al. 2005; Hancock et al. 2005; Makogon 2010; Chong et al. 2016). These verifications are based upon several external factors such as marine and environmental, geological hazards. The advantages and disadvantages of some research work on chemical injection are listed in Table 2.

CO_2 SEQUESTRATION

The shortcomings of the chemical injection method thermal stimulation method, and depressurization method, is the low efficiency of heat transfer in a reservoir, which controls the decomposition rate of hydrates. The thermal conductivity of formation is relatively poor; hence the efficiency of the decomposition process cannot be compensated. The temperature in the hydrate decomposition region declines rapidly due to the huge absorption of heat. The above methods will decrease the reservoir's strength and further cause slope instability, seabed destruction because these methods depend on the principle of decomposition of hydrate (Khlebnikov et al. 2016). The CO_2 replacement method appears to be more profitable as it permits both recovery of gas from hydrates and sequestration of CO_2 as hydrates in the region of deep-sea sediments. This method is applicable where the ocean floor remains stable during the process and after the injection of CO_2 (Ors and Sinayuc 2014). The CO_2 sequestration process is the complex and immature technique for the dissociation of hydrates. The main drawback of CO_2 sequestration is the requirement of a high amount of CO_2, which can increase the process's cost (Ors and Sinayuc 2014). Several researchers have done work on this method for the decomposition of hydrates before and after the experiment. Studies were done by Yoon et al. 2004 revealed that the surface covering of CO_2 gas hydrate in the outermost layer is taken as an important part for deaccelerating the dissociation of methane gas hydrate within the core. But the water phase generated during the sequestration process allows the process to move forward rapidly by increasing the diffusion of carbon dioxide and methane, which results in absolute and comparatively fast production of methane gas (Yoon et al. 2004). Seo et al. 2013 suggested that various factors such as reaction kinetics, the environment of sediment, size of hydrate particle, and mass transfer should have to be considered for the replacement of CO_2 in natural gas hydrates deposits (Seo et al. 2013). Xu et al. 2017 worked for the replacement of different gas mixtures to produce methane gas from hydrates by the replacement method. Small molecules sized gases enhanced the rate of replacement by the stronger diffusivities in gas hydrates (Xu et al. 2018). Ota et al. 2005 found out that the mole fraction of CO_2 and CH_4 in the hydrate zone increases and decreases with time, respectively. They also provided a kinetic model for the exchange process by including the tendency of CH_4 re-generation in the S-Cage (Ota et al. 2005). Liu et al. 2016 investigated the thermodynamic and kinetic feasibility of CH_4 from hydrates by N_2/CO_2 mixture using the ab initio calculations and ab initio molecular dynamic simulations (Liu et al. 2016). Xu et al. 2015 examined the production of methane from a natural gas hydrate by CO_2 replacement by the estimation of similarity between various spectra of C-H, O-H, and C-O stretching vibrations in the different phases and gas hydrates with the help of Raman and NMR (Xu et al. 2015). Lee et al. 2014 developed an experimental system to obtain quantitative information for the exchange process of CO_2 and CH_4 (Lee et al. 2014). Espinoza and Santamarina 2011 designed an experiment to find the advantage of the contact- dependent sand stiffness on the formation of hydrate, CO_2 flooding and gas replacement, and dissociation (Espinoza and Santamarina 2011). Jung

et al. 2010 evaluated the reaction rates, analyzed underlying phenomena, explored the region for the pressure-temperature for the optimal change, and anticipated the potential geomechanical implications the replacement in hydrates bearing sediments (Jung et al. 2010). Serrano et.al 2009 tested a continuous jet hydrate reactor in the seafloor process simulator for the CO2 replacement (Serrano et al. 2009). Pohlman et al. 2009 suggested that the decreased sedimentation rate increases the disclosure time of organic matter in sediment to anaerobic and aerobic degradation (Pohlman et al. 2009). Seo et.al 2016 experimented with investigating the replacement mechanism in the C_3H_8+CH_4 hydrate (sII) by injecting a gas mixture CO_2/N_2 (Seo et al. 2016). Yang et.al 2017 explored the potential for the production of methane from gas hydrate reservoirs by the injection of flue gas and form a carbon dioxide hydrate by the sequestration of CO_2 from flue gas (Yang et al. 2017). Wang et al. 2017 proposed a new dissociation technique for natural gas hydrate which improves the effect of replacement and reduces the cost of gas separation, but it decreases the partial pressure of methane gas in the gas phase. H_2 has an important role in disturbing the stability of methane hydrate (Wang et al. 2017b). Seo et al. 2013 suggested through the thermodynamic equilibrium studies that the composition of CO_2 in the hydrate zone and the chemical formula of mixed gas hydrate after the sequestration process can be determined at certain conditions (Seo et al. 2013). Lee et al. 2015 showed that the structural and thermodynamic properties of the mixed gas hydrates are sensible factors to determine the flow of heat in the sediments, for the required heat for the dissociation of hydrate and for the evaluation of the storage capacity of CO_2 in hydrate reservoir (Lee et al. 2015). Zhang et.al 2017 proposed a combined method using CO_2 replacement and the thermal stimulation to increase the recovery of methane gas from hydrates and CO_2 storage (Zhang et al. 2017). Ors and Sinayuc 2014 concluded the swap process of CH_4-CO_2 happens at the surface of the system mostly and the center of the system of unconsolidated sand pack accommodate CH_4 while surface contains CO_2 (Ors and Sinayuc 2014). Deusner et al. 2012 observed the production of methane from the methane gas hydrates by the injection of hot and supercritical CO_2. They concluded that the dissociation of methane gas hydrates is triggered by the heat addition, while thermally equilibrated CO_2 will react with pore water and reserves in the reservoir as immobile. They also studied the effect of temperature on the production process of methane gas from sediment by studying the effect of permeability (Deusner et al. 2014).

The above methods are not favorable for dissociating gas hydrates in marine sediments due to their limitations and disadvantages (Ning et al. 2010). Table 3 listed the advantages and disadvantages of available dissociation techniques of gas hydrates.

Table 3. Advantages and Disadvantages of different dissociation techniques of gas hydrates.

Technique	Advantages	Disadvantages	References
Depressurization	can reduce energy consumption	Advantageous for the widespread gas reservoirs in a closure	(Max and Cruickshank 1999)
Thermal Stimulation	Can overcome the problems associated with low gas production by depressurization	High loss of heat Low efficiency High consumption of energy	(Song et al. 2016; Zhang et al. 2017)
Chemical Injection	Less expensive than other methods	Not advantageous for the oceanic area Very expensive Environmental Pollution	(Demirbas 2010b; Ning et al. 2010)
CO2 replacement	----	The cost of CO2 supply is high. Efficiency and replacement speed is low.	(Lee et al. 2003; Ors and Sinayuc 2014)

COMBINED PROCESS

The thermal Stimulation method can also be combined with the depressurization method to dissociate the gas hydrates. Various studies were reported to observe the effects of this combined method. Wu et al. 2012 used two methods (thermal stimulation and depressurization) under the equilibrium pressure for the dissociation of pure methane hydrates formed below the ice point (Wu et al. 2012). Song et.al 2015 provided the experimental investigation of the dissociation of gas from porous media by the injection of two-cycle warm water, depressurization, and combined method with different hydrate saturations. They concluded that the combined method is an effective and improved method for the dissociation of gas from methane gas hydrate formed in sediments. The combined process increases the average production rate of gas with increasing saturation (Song et al. 2015). Yuan et.al. 2013 studied hydrate dissociation using hot water, ethylene glycol, and brine solution with the continuous injection mode. The NaCl solution shows the highest amount of gas production (Yuan et al. 2013). Wang et al. 2014 examined the production behavior of methane gas hydrate by applying the three-dimensional pressure vessel and thermal stimulation method in the porous media. Using, the experimental conditions are manipulated by the set of scaling criteria for the gas hydrate reservoir (Wang et al. 2014). Wang et al. 2017 experimented with investigating the effect of thermal heat flow on the dissociation of gas hydrate by applying the depressurization method with the thermal stimulation (Wang et al. 2017a). Pang et al. 2009 showed the kinetic behavior of dissociation conducted by hot water. They showed that the rate-determining factors for hydrate dissociation are the heat transfer rate and the thermodynamic driving force of dissociation. The production of gas from hydrate can be increased by combing heating and depressurization (Pang et al. 2009). Liu et al. 2009 developed a mathematical model of dissociation of gas hydrate in the porous media by applying the depressurization and the thermal stimulation method. The Huff and Puff method was applied within the Prudhoe Bay of the Alaskan North Slope (Liu et al. 2009). The dissociation was carried using N_2-CO_2-CH_4 exchange to produce methane from the hydrate reservoir (Max and Johnson 2018).

ECONOMICS

The production of gas from hydrates is seemed to be more expensive as compared to conventional natural gas. Because of the higher cost of current dissociation techniques, it becomes essential to find the economically favorable dissociation techniques of gas hydrates based upon higher production rate, lower transportation cost to balance the higher wellhead cost as compared to the conventional gas production from gas fields (Cranganu and Nitzov 2009). Many researchers have suggested depressurization as the most economical dissociation techniques for gas hydrates (Makogon 1997a; Pooladi-Darvish 2004). Table 4 shows the economic comparison of different dissociation techniques of gas hydrates.

Table 4. Comparison of different dissociation techniques of gas hydrates (Collett 2002; Cranganu and Nitzov 2009; Arora et al. 2015b)

Parameter	Depressurization	Thermal Stimulation	Conventional Gas Production
Investment (million Rs.)	166000	254200	157500
Annual Cost (million Rs.)	125500	160000	100000
Total Production (million m^3/year)	1557.43	1274.26	1557.43
Production Cost (Rs. million/m^3)	4025.9	6356.6	3213.6
Breakeven Wellhead Price (Rs. million/m^3)	2532.3	7945.8	3972.9

CONCLUSION

Natural gas hydrates are a significant source of energy all over the world. It can replace the various other sources of natural gas to fulfill the energy requirement of the world in future. Hence, natural gas recovery from gas hydrates became a significant research area in the present days. Various techniques are available for the dissociation of gas hydrates, but the economical production of gas from gas hydrates is a significant issue nowadays. Various safety issues are associated with the recovery of hydrate energy source for example seafloor subsidence and green house effects. The production testing of hydrate is in progress in Canada, The United States of America, Japan and India. This paper reviews the present dissociation techniques of gas hydrates and their advantages and disadvantages. Hence, to overcome these disadvantages, there is a need to explore the new dissociation techniques for the economical production of gas from gas hydrates. Hydrates can contribute significantly to the conventional future energy demand of the world.

ABSTRACT

Biofuels have gained significant interest as an alternative fuel in recent years owing to their environmental sustainability, cost-effectiveness, and the ability to blend with traditional fuels like gasoline without requiring engine modifications. The use of microalgae for biofuel production is universally preferred due to its energy efficiency and environmental sustainability; current research is geared towards enhancing the production of microalgae-biofuel from the initial stages to the final product as it is a cost-effective fuel option. The use of different types of nano-additives at different stages of microalgae cultivation and incorporation into biofuel produced noteworthy improvements in the final product. This chapter focuses on the prospective uses of nano-additives in microalgae cultivation, microalgal biomass conversion to biofuels, and biofuel combustion improvement for revolutionary advancements in biofuel technology.

INTRODUCTION

Photosynthetic microorganisms like green microalgae, diatoms, and cyanobacteria offer significant advantages over terrestrial plants providing an abundance of various biomolecules to be used for food, feed, and fuel applications. Microalgae or microphytes are microscopic algae. They are naturally found in freshwater bodies and oceans. Microalgae are unicellular species that can exist individually or in

chains or groups. Microalgae can vary in size depending on the species, from a few micrometers (μm) to a few hundred micrometers. Microalgae are efficient photosynthesizers and are crucial for life on earth producing around half of the atmospheric oxygen it also performs its role as a photoautotroph consuming greenhouse gases like carbon dioxide to grow. Forming the base of the food web Microalgae and bacteria provide energy for all the trophic levels above them (Peter *et al.,* 2021). There exists a rich biodiversity of microalgae which represents an abundant, almost untapped resource. There are about 200,000-800,000 species in different genera of microalgae of which about 50,000 species are characterized and described. More than 15,000 novel compounds originating from algal biomass have been identified including carotenoids, antioxidants, fatty acids, enzymes, polymers, peptides, toxins, and sterols.

Microalgae form an abundance of carbon-rich biomass, that can be tapped for the production of biofuels, cosmetics, health supplements, and pharmaceuticals. They also have numerous applications in wastewater treatment and sequestration of atmospheric CO2. A wide range of bioproducts, including polysaccharides, lipids, pigments, bioactive compounds, proteins, vitamins, and antioxidants are also derived from microalgae. There is a rapidly growing interest in the use of microalgae as a renewable and sustainable feedstock for biofuels production fueling new research in the field of biorefinery using microalgae. The cultivation of microalgae on an industrial scale to produce biofuels and bioproducts has increased radically in the last couple of decades (Low *et al.,* 2021).

MICROALGAE AS A BIOFUEL

The increasing global demand for fuel energy, the intensive use of fossil fuels worldwide leads to its depletion and economic crises and global tension around the control of fossil fuels heralds the need for alternative, environment-friendly and sustainable fuel sources. Thus, biofuels are increasingly viewed as an alternative to fossil fuels. Some developed countries have already started the mass production of biofuels. Biofuels such as biodiesel and bioethanol are superb alternative fuels and can be produced from a number of sources of biomass, including garbage, food crops, crop wastes or fruits, woody parts of plants, and algae (Harun, Danquah and Forde, 2010; Ho, Chen and Chang, 2010). The advantages of the use of biofuels from biomass are renewability and a significantly smaller contribution to environmental pollution and global warming. The release of CO2 from the burning of fossil fuels is one of the main causes of global warming. 29 gigatons/year of CO2 is released with a total of 35.3 billion tons of CO2 released to date from the burning of fossil fuel (Paul *et al.,* 2014). Biofuels like algal fuels have oxygen levels of 10–45% and negligible levels of sulphur emission while petroleum-based fuels have no oxygen levels and considerable sulphur emission. Microalgae fuels are known for being environment-friendly, non-toxic, and capable of fixing global CO2. Gendy *et al.,* 2013 reported that 1 kg of algal biomass is capable of fixing 1.83 kg of CO2 additionally certain species are known to utilize and remove SOx and NOx along with CO2.

Various applications have been exhaustively studied for different species of microalgae. Table 1 summarizes various species of microalgae, ideal culture settings (cultivation environment and water quality), availability, and cellular requirements (Hossain, Zaini, Mahlia, and Azad, 2019). Carbohydrates, proteins and lipids are the primary constituents of complex biofuels (e.g., bio-oil, biodiesel, biobutanol, etc.,) (Harun and Danquah, 2011, Pathak, Singh, Kothari and Chopra, 2014). Microalgae contain large fractions of lipid, protein, and carbohydrates which are important for biofuel production. Table 2 details the cellular composition of prominent microalgae species used for biofuel production (Hossain *et al.,* 2019). Microalgae are ideal candidates for biofuel production owing to its feasibility to be grown and harvested on both land and water and the high lipid content. Nanotechnology comes into the picture because lipase immobilization and lipid extraction from microalgae are costly processes. To address this, nano-additives are increasingly being used in the production of microalgal-based biofuels.

Table 1. Prospective species of microalgae for the production of biofuel (Hossain et al., 2019).

Name of the Microalgae
Chlamydomonas reinhardtii
Symbiodinium sp.
Phaeodactylum tricornutum
Chlorella vulgaris
Saccharina japonica
Spirulina platensis
Ostreococcus tauri
Chlorella sp.
Nannochloropsis sp.
Botryococcus braunii
Chlorococum sp. and *Spirogyra* sp.

Table 2. Microalgae species with optimal physiochemical composition for biofuel generation (Hossain et al., 2019).

Species of Microalgae	Total Sugars Content (%)	Protein Content (%)	Lipid Content (%)	Ash and Other Content (%)
Bellerochea sp.	3	24	15	3
Chaetoceros sp.	2	18	18	3
Chlamydomonas reinhardtii	48	17	21	14
Chlorella sp.	56	22	19	3
Dunaliella salina	57	32	6	5
Porphyridium cruentum	35	50	11	4
Rhodomonas sp.	9	74	15	2
Scenedesmus sp.	18	56	12	–
Spirogyra sp.	20	55	16	9
Spirulina platensis	60	12	8	20

Numerous biofuels like biodiesel, bioethanol, biomethane, bio-oil, bio-hydrogen, etc., are produced from microalgae (Brennan and Owende, 2010; Hossain *et al.,* 2019). Biodiesel is increasingly used as a replacement for fossil-based diesel as a sustainable biofuel. Despite the many benefits of using biodiesel, properties such as lower fuel atomization and high viscosity, result in BTE reductions. Innovation in the field of nanotech have resulted in the development of nano-molecules with improved thermal properties, which help in combustion, and increase volume-surface ratio and results in improved fuel characteristics and better engine performance and lower emissions. Nano-particles can be added during various stages of microalgal growth (e.g., cell suspension, cell separation, and cell harvesting), biofuel conversion stage and fuel application stage for increased total yield in each stage.

MICROALGAE-BIOFUEL WITH NANO-ADDITIVES

Nanoparticles and Nano-Additives

Nanoparticles (NPs) include a collection of materials that have at least one dimension less than 100 nm. Nanomaterials can be 0D (zero dimensional), 1D, 2D, or 3D depending on the general shape (Tiwari, Tiwari and Kim, 2012). NPs are usually made up of three layers i.e. (a) The surface layer- This can be made functional by using various small molecules, metal ions, surfactants, and polymers. (b) The shell layer- this has a different chemical composition from the core, and (c) The core- the central portion of the Nanoparticle (Shin, Cho, Kannan, Lee, and Kim, 2016). Due to these unique characteristics, nanomaterials garnered a great deal of intrigue and interest of researchers in various disciplines and fields. The NPs have applications in drug delivery (Lee, Lee, Kim, Kim, Hyeon, 2011), as biosenors and chemical sensing (Barrak, Saied, Chevallier, Laroche, M'nif, and Hamzaoui, 2019), gas sensing (Mansha, Qurashi, Ullah, Bakare, Khan, and Yamani, 2016; Rawal and Kaur, 2013), CO2 capture and sequestration (Ganesh, Hemalatha, Peng, and Jang, 2017; Ramacharyulu, Muhammad, Kumar, Prasad, and Mohanty, 2015) and various other applications (Shaalan, Saleh, El-Mahdy, and El-Matbouli, 2016). Nanomaterials are used as additives to improve the biofuel yield and facilitate biofuel utilization in petrol and diesel engines.

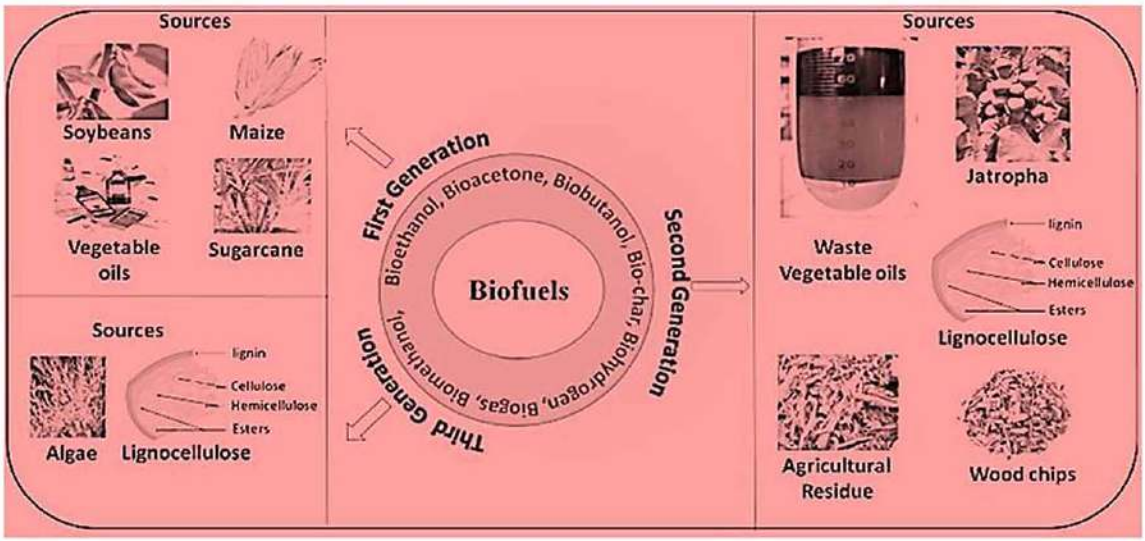
Nano-additives such as nano-magnets, nano-crystals, nano-droplets, nano-ðbres, etc., Figure 3 depicts the application areas of nano-additives in microalgae cultivation, and biofuel production.

Figure 3. Representation of biofuel types and their sources
(Arya et al, 2021)



Nanoadditives can be added at various stages of biofuel production from microalgae cultivation to biofuel application in engines due to their durability, recyclability, crystalline nature, adsorption efficiency, stability, catalytic activity, high storage capacity, superb biofuel yield, economical advantage and eco-friendly characteristics. (Hossain *et al.,* 2019). Use of Nano-technology has been shown to improve microalgae cultivation, maximize the yield of many microalgal biofuels and facilitate the use of such microalgal-biofuels in petrol and diesel engines and enhance the performance of biofuel-diesel hybrid fuels. Various nano-materials, e.g., nano-fibers, nano-sheets, nano-particles, nano-tubes and other nanostructures, have been investigated as effective nano-catalysts in biofuel production (e.g., bioethanol, biodiesel, biomethane, and others) and yield enhancement (Hasannuddin *et al.,* 2018; Karthikeyan and Prathima, 2017; Kim, Jia and Wang, 2006; Safarik, Prochazkova, Pospiskova, and Branyik, 2016).

Nano-Additives for Microalgal Growth

Microalgal growth rate remains a limiting factor in the lipid accumulation rate by microalgae and ultimately the mass production of biofuel from microalgae. Growth rates can be significantly accelerated by the use of nanomaterials. Sarma *et al.* (2014) studied the effects of Mg nanoparticles (NPs) on the microalgal growth rate, biomass production, and accumulation of intracellular compounds when Mg NPs were integrated into microalgae culture at different concentrations. They observed an improvement in their growth and lipid production upon use of the Mg NPs as nutritional additives. Nanoparticles added to wastewater may supplement nutritional deficits. Nanoparticles in culture media can also compete for nutrient absorption, inducing microalgae to absorb nutrients and accumulate lipids at a higher rate. An

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

added benefit of using nanoparticles is that they possess antibacterial and antifungal properties to the culture media, inhibiting the growth of and killing bacteria and fungi which compete with microalgae for nutrients.

Nano-particles added during microalgae culture in a Photobioreactor (PBR) can boost and improve light conversion efficiency. Recently there has been an increased use of light-emitting diodes (LEDs) equipped with nano-materials in PBRs especially in the PBRs which use artificial light sources that lead to increased energy consumption and cost and where self-shading and biofilm formation on PBR surfaces during the growth of biomass lead to inadequate light penetration to the various parts of the culture. In order to circumvent this and to achieve desired illumination properties and photo-conversion efficiency in the PBR the nanoparticles were used. Pattarkine *et al.* (2012) reported the use of Gallium aluminum arsenide (GAA)-fabricated LEDs for algae cultures and the use of optical fibers which are cheaper alternatives. Steele, Grady, Nordlander, and Halas (2007) reported on another advancement in this field where metallic nano-particles (MNPs) integrated with localized surface plasmon resonance (LSPRs) were used to amplify the light scattering at a certain wavelength. Silver nano-particles' (Ag-NPs') suspended in plasmonic mini-PBRs were shown to backscatter blue light considerably which greatly improved the photosynthetic efficiency in green microalgae, *Chlamydomonas reinhardtii*, and blue–green microalgae, Cyanothece 51142, and a 30% increase in microalgal-biomass (Torkamani, Wani, Tang, and Sureshkumar, 2010). Increased CO2 absorption from the atmosphere, better CO2 sequestration, improvement in yield and boosted biomass growth was seen on the use of nano-particles in microalgae cultivation. Pattarkine *et al. (*2012), Zimmerman, Hewakandamby, Tesař, Bandulasena, and Omotowa (2009); Zimmerman, Tesař, and Bandulasena (2011) reported the use of stable nano-bubbles that help algal biomass float into the culture thus facilitating high mass transfer efficiency, improved biomass density, improved CO2 absorption, O2 stripping, and slight buoyancy. Nano-bubbles were shown to suspend the biomass in an airlift-loop bioreactor (ALB) and use less energy than micro-bubbles. For this purpose a uniform nonporous membrane of ALB was used which was capable of producing 100 nm sized bubbles. Safarik *et al. (*2016) delineated that nano-additives are very important for the flocculation and separation process before biofuel production besides microalgae harvesting.

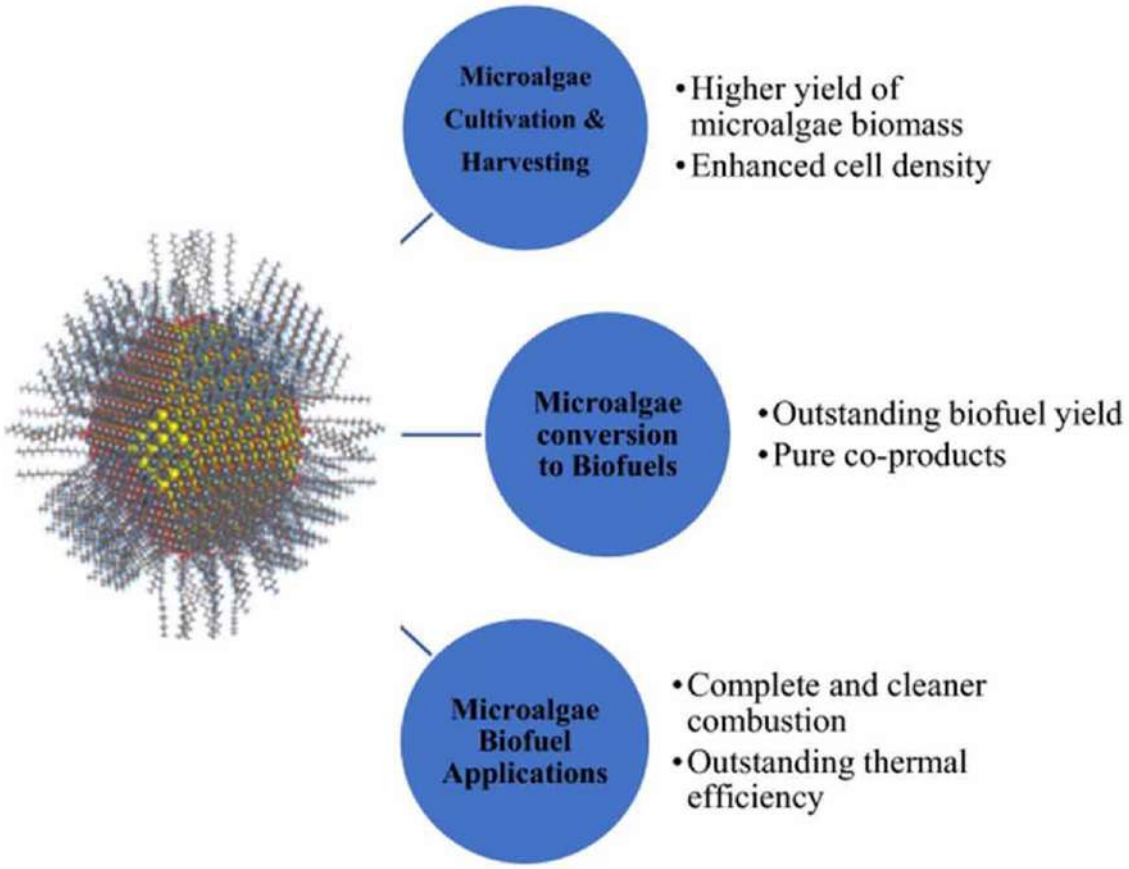
Figure 4. Nano-adhesives used for the enhancement of microalgae cultivation and biofuel production and implementation
(Hossain et al, 2019)



Nano-Additives for Microalgal Lipid Production

Microalgae typically accumulate large amounts of carbon sources when stressed in the form of pigments, starch, lipids, or moieties for self-protection from damage These results mainly from nutrient deprivation or shortage and can be exploited to abet the accumulation of vast amounts of carbon sources like sugars, starch, lipids and lipid moieties (Kadar, Rooks, Lakey, and White, 2012). These stress responses however result in decreased cellular growth. Nanoparticles added to microalgal culture media act as nutritional supplements to enhance growth and lipid accumulation. In the species *Trachydiscus minutes* a lipid increment from 26.20% to 35% was seen when 5.1 mg L−1 zero-valent iron nanoparticles (nZVI) were added (Pádrova *et al.* 2015). *Desmodesmus suspicious* showed a similar 38% increase in lipid accumulation when the identical concentration of nZVI was used. Ren *et al.* (2020) reported a similar occurrence when SiC nanoparticles were added to *Scenedesmus sp.* and the lipid content was enhanced. They also observed a biomass production of 3.18 g L−1 and lipid content of 40.26% with a 150 mg L−1 concentration of SiC nanoparticles under xenon light. Acetyl-coenzyme A carboxylase (ACCase) which is a key rate-limiting enzyme that catalyzes the first step in the biosynthesis of fatty acids was increased

which likely increased the lipid content showing that SiC nanoparticles stimulate the activity of ACCase under xenon light, that lead to increased lipids synthesis. Several studies were conducted on the application of Mg, Se, Fe, Cu, C, Pb, Zn and Si nanomaterials in *C. vulgaris, S. obliquus, C. pyrenoidosa, T. minutus, S. rubescens, P. kessleri*, and *T. suecica* demonstrated NP application which led to accelerated microalgal growth, higher lipid contents and increased biomass production (as shown in Table 3) which can be exploited to achieve higher yields of biofuel (Sarkar *et al.* 2021).

Nano-Additives for Microalgae Biomass Conversion to Biofuels

Biodiesel, a form of microalgae biofuel, has gained in popularity as a commercial biofuel in the automotive fuel industry. Acidic and basic nano-catalyst spheres, which are recyclable and have a beneficial impact on the economy, can replace chemical compounds such as sodium methoxide in biodiesel generation by interacting with free fatty acids and oils. According to Trindade et al., 2011, using nano-catalysts minimises the amount of pollutant released into the environment generated by sodium methoxide, and the reactions may also be carried out at low temperatures and pressures. Silitonga, Atabani, Mahlia, Masjuki, Badruddin, and Mekhilef (2011); Trindade *et al.* (2011); Palaniappan *(*2017) and Nizami and Rehan (2018) described that Microalgae culture and growth may be considerably enhanced by using spherical nano-particles made of sand (silica) and calcium compounds without affecting harvesting. According to Chen, Mochizuki, Abe, Toba and Yoshimura (2014), a mesoporous silica nano-catalyst, Ti-loaded SBA-15, produced 10 times more free fatty acids (FFA) and tolerated water than any other catalyst for biodiesel generation from vegetable oil. It also outperformed other effective nano-catalysts like titanium silicalite-1 (TS-1) and titanium dioxide silicate (TiO2-S) and may thus be utilised to produce high-quality biodiesel from diverse sources.

Trindade et al. (2011) and Chen et al. (2014) described how Ti-loaded Santa Barbara Amorphous-15 (SBA-15) nano-catalysts reduced the chemical (alkaline catalyst, NaOH) cost of transesterification during biodiesel production, and how recycling the nano-catalyst made the process eco sustainable. Silva et al., 2017 demonstrated higher microalgae-biodiesel output when Niobia (N2O5) was combined with SBA-15 to produce biodiesel from biomass via esterification. Palaniappan et al. (2017) found that combining an enzyme extracted from the bacteria *Pseudomonas cepacia* with nano-particles such as polyacrylonitrile (PAN) nanofibre, Fe3O4, and nanoporous gold; lipase enzyme from *Rhizopus miehei* with silica nano-particles; ferric silica and the transesterification procedure used magnetic nanoparticles with Burkholderia sp. lipase and *Thermomyces lanuginosa* to create biodiesel from various bio-oils. Liu *et al.,* 2018 and Palaniappan et al. (2017) used a nano-magnetic biocatalyst of KF/CaO–Fe3O4, Li (lithium)-doped CaO, Fe2O3–CaO, sulphate (SO4) integrating Zi (zirconium), sodium titanate, and carbon-based nano-tubes and nano-particles from different kinds of biomass and biodegradable waste to produce 95 percent biodiesel. During the transesterification process, a zeolite NP (an alumina silicate mineral), has been employed as a commercial absorbent for increasing biodiesel output efficiency. Carrero et al. (2011) demonstrated the synthesis of biodiesel from *Nannochloropsis* microalga oil using a hierarchical h-Beta zeolite catalyst. In the process to produce FAMEs from Nannochloropsis oil, the catalyst had the maximum activity. The use of hierarchical catalysts demonstrates equal acid strength and number of acid sites for normal zeolites, but with a larger exterior surface area and the inclusion of a secondary micro-mesoporosity that minimizes lipid transport barriers to the zeolite acid active sites. Table 4 illustrates the use of nano-additives to enhance biodiesel yields during microalgae to biofuel conversion, as well as the relevant conversion procedures and efficiencies.

Nano-Additives for Microalgal CO2 Absorption and Sequestration

Photosynthesis is one of the most common methods to utilize CO2 that has been sequestered. The largest contributors of biological CO2 fixation are microalgae. According to Huang et al. (2014), 1 tonne of microalgae can sequester 1.8 tonnes of CO2. Enhanced CO2 fixation resulted in improved nutrition supply to microalgae, resulting in raised biomass production during the log phase of development and product accumulation (Ling, Guo, Liu, Zhang, Wang, Lu, and Ng, 2015; Da Silva Vaz, da Silveira Mastrantonio, Costa and de Morais, 2019; Choi et al. 2012). Choi et al. (2012) revealed that when the quantity of dissolved gas in the liquid was enhanced well above natural balance of the algal culture, there was an elevation in CO2 fixation by microalgae. As adsorbent materials, nanoporous materials such as polymeric nanofibers have been increasingly popular in recent years (Vaz et al. 2018). Nanofibers are incredibly beneficial since they can be readily isolated from microalgal biomass, according to the researchers. In microalgae production, polymeric nanofibers can be employed as CO2 absorbents to enhance permeance in the medium, contact duration between the microalgae and the CO2, and CO2 mass transfer to the cells (Da Silva Vaz et al. (2019); da Silva Vaz, Costa and de Morais, 2020). Da Silva Vaz et al. (2019); Vaz, Costa and Morais (2018) revealed the synthesis of functional composite nanostructures by integrating metal nanoparticles or metal oxides into nanofibers, leading to improved adsorption efficiencies and molecule transport and interactions. The inclusion of nanoparticles to microalgal growth medium by Li et al. (2016) resulted in a microorganism-particle assembly for Co2 sequestration and in-situ conversion. The gas adsorbed on the nanofibers is progressively desorbed into the culture medium as a result of this. Vaz et al. (2018) investigated the impacts of different Fe2O3 nanoparticle concentrations and observed that 4 percent (w/v) Fe2O3 nanoparticles had a better CO2 adsorption capability. The smaller nanofibers and increased porosity are responsible for the enhanced CO2 adsorption/capture efficiency. When Chlorella fusca LEB 111 was grown in nanofibers with 4% Fe2O3 nanoparticles, a higher biomass concentration of 794 mg L−1 was observed, leading to the conclusion that nanofibers with Fe2O3 nanoparticles increased the specific surface area and CO2 adsorption capacity of the nanostructures, leading to greater gas availability in the microalgal medium, advancing production and enhance fixation.

Da Silva Vaz et al. (2019) investigated the addition of 4 percent Fe2O3 nanoparticles in their free form and encased in a stainless-steel screen support to *C. fusca* LEB 111 growth medium. Due to the desorption of the gas adsorbed on the nanostructures, the free form nanofibers supported a threefold buildup of CO2 in the medium, resulting in a 45 percent rise in fixation by the microalgae and an elevation in the (Dissolved inorganic carbon) DIC. Vaz et al, (2019) studied CO2 fixation in *C. fusca* LEB 111 grown in outdoor and indoor environments using polymeric nanofibers containing 4% Fe2O3 nanoparticles. Outdoor experiments showed increased CO2 fixation, which might be attributed to an increase in biomass content as the nanofibers-maintained CO2 for a longer period of time.

Nano-Additives for Microalgae-Biofuel Applications

Sinha et al. (2017) and Silitonga et al. (2018) reported enhanced fuel lubricity, catalytic efficiency, chemical processes, mass and heat transfer efficiency, cetane number, combustion rate, fire/flash point, water co-solvency, and reduced retention times, resulting in a more comprehensive and cleaner combustion of microalgae biofuel, while investigating solid nano-particles, nano-fluids, or nano-droplets with biofuel and fossil fuel. According to Trindade et al. (2011); Sinha et al. (2017); and Damanik, Ong, Tong,

Mahlia, and Silitonga, (2018), nano-additives can improve microalgal-biofuel combustion efficiency while lowering smoke, NOx, soot, HC, CO2, and CO emissions into the atmosphere by 72 percent.

Karthikeyan and Prathima (2017), Sinha et al. (2017), Karthikeyan, Elango, Prathima and Raja (2014) and Karthikeyan and Dharma Prabhakaran (2018) reported an 11 percent rise in engine power, torque, and braking system thermal efficiency of biodiesel (derived from microalgae as well as other biomass) in CI and DI engines when solid nano-additives such as alumina (Al2O3) An research study with DI engines using nano-particles combined with biodiesel and also a diesel–biodiesel combination revealed outstanding performance and higher efficiencies than conventional catalysts (Prabu, 2018, Ong et al. 2018). Dhinesh and Annamalai (2018) found that nano-particles of CeO2 integrated into a biofuel emulsion employing sol–gel combustion technology functioned admirably in mono-cylinder 4 stroke direct CI and DI engines with no hardware modifications. In general, nanoparticles in biofuels boosted the calorific value of the fuel, expedited evaporation, enhanced brake-specific fuel consumption and thermal efficiency, and minimized greenhouse gases (GHGs) including CO, NOx, and smoke, as well as unburned hydrocarbons.

Scientists have successfully developed unique nanofluids by combining several nanoparticles. Because of their capacity to enhance the chemical and thermophysical characteristics of single-phase nanofluids, hybrid nanofluids have piqued the interest of many researchers (Hussain et al. (2020); Karisathan Sundararajan and Ammal, 2018). Selvan et al. (2014) investigated engine efficiency and emission of diesel-biodiesel-ethanol mixtures including cerium oxide nanoparticles and carbon nanotubes. To oxidise CO and diminish nitrogen oxides, cerium oxide nanoparticles served as oxygen supply catalysts. The activation of cerium oxide, which reduced carbon deposits in the cylinder, resulted in a considerable decline in HC and smoke emissions. As a result, the employment of both nanoparticles together can result in cleaner combustion and lower emissions.

Arunprasad, Sener, Thirugnanasambantham, Elango and Bothichandar (2022) conducted study on the performance and emissions of diesel engines incorporating a spirulina microalgae biodiesel mixture (B20) containing magnesium oxide nanoparticles. Because of its low calorific value, Spirulina microalgae biodiesel has poor brake thermal efficiency (BTE) and brake-specific fuel consumption (BSFC) fuel characteristics in general. Conversely, in their study, MgO nanoparticles coupled with spirulina methyl ester significantly enhanced its catalytic action, raising BTE and decreasing BSFC. This paves the way for including spirulina biodiesel enriched with magnesium oxide nanoparticles in diesel engines to substitute diesel without incurring any additional costs or necessitating hardware alterations. Thirugnanasambantham and Elango, 2020 investigated B20, a combination of biodiesel (20%) and diesel (80%), as a way to augment diesel fuel in IC engines with less expensive algal biofuels while lowering emissions. In a four-stroke diesel engine with no alterations, TiO2 nanoparticles added to the B20 fuel resulted in significant reductions in HC, CO, and smoke emissions.

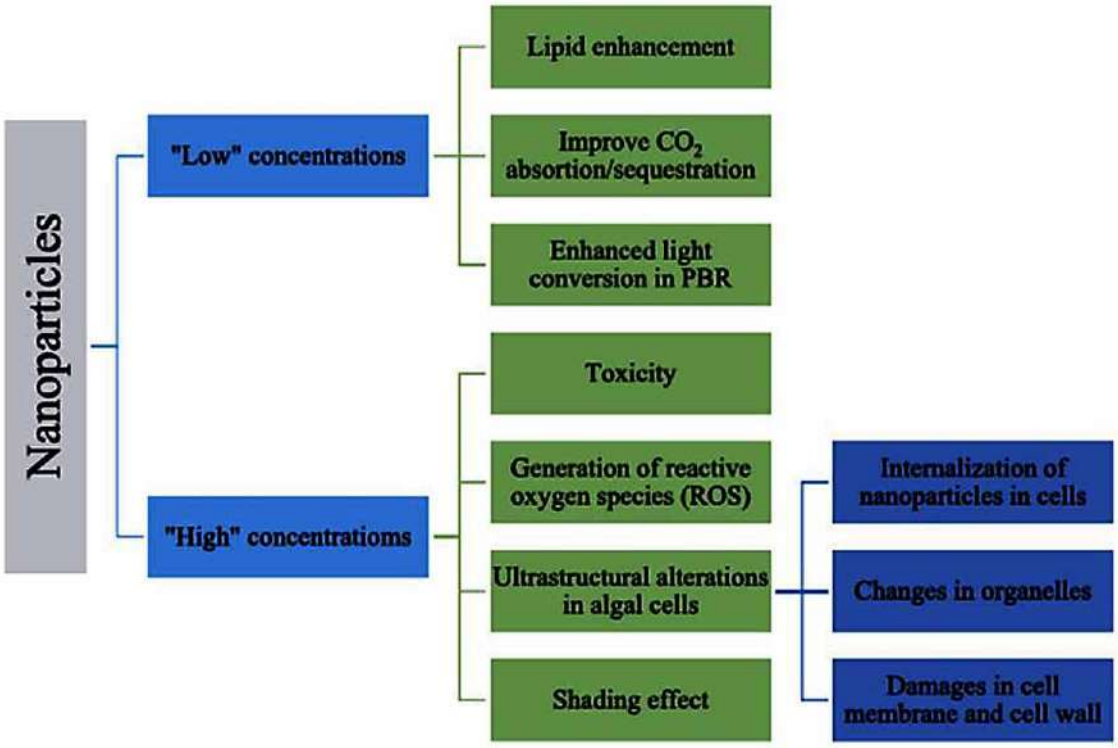
Figure 5. Effect of nano-particle addition to microalgae culture
(Vargas-Estrada et al, 2020)



CONCLUSION

One of the major advantages of employing microalgae for biofuel production is the abundance of diversified, lipid-accumulating microalgal species in nature. Large-scale microalgal production for biofuel and several other significant products, as well as the selection of suitable microalgal strains, may be achieved in the future by integrating conventional and cutting-edge processes. Biodiesel may be generated using heterotrophic microalgae as a feedstock. Unfortunately, the exorbitant expense of lipid extraction makes this method difficult. Nanomaterials can be intended to safeguard microalgal cells from damage, and nanoparticles may also be used to harvest microalgae. Because nanoparticles alter the lipid metabolism of microalgal cells, adding them to the culture medium can enhance lipid buildup. Nanotechnology might help enhance biodiesel synthesis from heterotrophic microalgae, however this process is still in its nascent phases. Future research might consider the effect of lipid buildup produced by the inclusion of nano silica and iron oxide to heterotrophic microalgae's growth medium. Strategies to gene manipulation that are careful and meticulous in their usage of genetically - modified strains offer a promising path to long-term and economical microalgal based biodiesel synthesis. The fabrication of nanomaterials different functional groups essential for lipid disintegration and cell wall breaking/weakening should be given more attention. Immobilization of whole-cell lipase on nanoparticles should be optimised and evaluated. There is a need for technological advancement, technical knowledge, and the identification of relevant microalgae species with optimal growth and production characteristics. Further changes to

the development of genetically enhanced species should be made so that the appropriate quantity of biodiesel may be generated in a shorter period and with less energy usage.

ABSTRACT

The chapter discusses the methods effective for the extraction of useful energy from the macroalgae biomass including liquefaction, anaerobic digestion, fermentation to biobutanol, trans-esterification to biodiesel, pyrolysis, direct combustion, fermentation to bioethanol, and gasification. However, if the algae are suited for the production of biodiesel, they can be studied from the content of their triacylglycerols (TAGs). Due to having high fatty acid content, they have a high conversion rate to biodiesel, and the lack of sulphur, phosphorus, and nitrogen also aids in the conversion. This chapter highlights the limitations and suitability of macroalgae for the conversion process in reference to chemical composition, process optimization, and cost effectiveness. It is concluded that bio-oils and bioethanol produced from wet macroalgae are considered over biodiesel production because of high lipid content of microalgae biomass. Moreover, the chapter considers electricity production from the dry mass as it would turn profitable, and this can be achieved from fast-growing macroalgae like "Ulva."

INTRODUCTION

Fossil fuel hydrocarbons are being overly used which results in their scarcity and being expensive. The focus of research on converting biomass to biofuels has shifted to third-generation biomass, such as algae. The first-generation feedstock is divisive due to the food-fuel conflict, whereas the high-cost lignin removal technique limits the second-generation biomass (A Bayu, 2018). As algae can repair greenhouse gases (CO_2) through photosynthesis, it is a promising renewable energy source. The typical photosynthetic productivity of marine biomass is 6–8%, which is significantly greater than the 1.8–2.2% of terrestrial

biomass (Adams, J.M., 2009 & Junying, 2015). Marine macroalgae are the source of aquatic biomass which shows significant opportunities to become renewable energy sources. Aquatic biomass has 6–8% of photosynthetic efficiency, which is significantly greater than terrestrial biomass (1.8–2.2%). For the conversion of solar energy and production of biofuels, either marine macroalgae such as seaweed or microalgae might be employed (Hirano, A, 1997).

Macroalgae are large, fast-growing marine and freshwater plants with a maximum length of 60 metres. Due to the lack of water limitations, the marine macroalgae growth rates outpace the growth rate of terrestrial biomass (K. Sudhakar, 2018). The principal marine macroalgae have higher yearly production rates (grams C m2 yr1) than most terrestrial biomass. Phytocolloids like agar, alginates (derived from Phaeophyta) and carrageenan (derived from Rhodophyta), are mostly generated from seaweeds. The by-products of such processing can likewise be used as a renewable energy source (Kawai, 2016 & Notoya, M., 2010). Macroalgae are primarily of three kinds green (Phaeophyta), Red (Rhodophyta) and brown (Phaeophyta) depending upon their photosynthetic pigmentation differences (Chlorophyta). Red has the most species (6000), green (4500), and brown (2000) (Inn Shi Tan, 2020; Mohsen Ghadiryanfar, 2016). Red algae grow in the intertropical zones while the brown algae thrive in temperate to cold or extremely cold seas. Green algae may be found in a range of aquatic environments. In Asia, macroalgae are now farmed for food, fertilisers, and hydrocolloid extraction, (72%) majority-owned by Japan, Korea, Philippines and China worldwide yearly output. Macroalgae productivity varies from 150 to 600 t per hectare per year in fresh weight, with a total global production of 12 million tonnes of dry matter per year (Ashok Pandey, 2011; Huihui Chen, 2015). The extraction from macroalgae biomass of biofuels, on the other hand, received not much attention. Hydrocolloid extraction is presently the only significant industrial product derived from macroalgae. However, macro-algae may be used to extract a variety of high-value speciality goods.

Chemical Composition of Macroalgae

Macroalgae have a dry matter content of only 10–15%. Large levels of carbohydrates may be found in dried macroalgae (approximately 60%). Carbohydrates are mostly obtained from cell wall components of macroalgae (Milledge, J.J., 2014). Red and green algae have an abundance of cellulose in them which is preferable for biofuel production. Seasonal changes in organic constitution and ash content differ correspondingly. For instance, the quantity of carbohydrates stored extends to the peak, in the fall. Mannan, ulvan, carrageenan, agar, laminarin, mannitol, alginate, fucoidin, fucose, and uronic acid distinguish macroalgae from microalgae and lignocellulosic biomass. Furthermore, lignin concentration as low as 0.03 g/kg of dry matter allows for downstream processing including fermentation or anaerobic digestion without the need for expensive pre-treatment.

Protein concentration in macroalgae can range from 7 to 31% dry weight, with lipid content of 2 to 13% dry weight. Macroalgae contain a significant quantity of carbohydrates (up to 32–60% of dry weight) (Gao, G., 2020). Macroalgae, being a photosynthetic organism is able to transfer into chemical energy from solar energy, usually as carbohydrates (mono- and polysaccharides). The intricacies of the aquatic environment, on the other hand, cause their metabolism to produce saccharides with distinct synthetic properties than those produced by terrestrial plants. For example, cellulose (35-50%) and hemicelluloses (20-35%), are made up of simple sugars such as ribose, glucose, mannose, xylose, galactose and arabinose, which are the most abundant carbohydrate components in all terrestrial plants. Furthermore, macroalgae contain a wide range of carbohydrates, including monomeric sugars of various kinds. Brown macroalgae have significant polysaccharides such as laminaran, fucoidan, and alginate, whereas red and green macroalgae have galactans (e.g. carrageenan and agar) and ulvan, respectively.

Carrageenan and agar are two polymers of modified galactose found in red macroalgae. Palmaria palmata has the greatest carrageenan content, with a concentration of 354 mg/g, and this high carrageenan content allows for a high bioethanol output. Brown algae, on contrary, is high in alginate and contains substantial amounts of laminarin, a significant amount of mannitol in the fall, and few commonly used sugars. The lipid content of brown and red algae is lower than 5%, which makes them unsuitable for biodiesel production. Green algae species vary in their cellulose content (Valonia types can have up to 70% cellulose) and starch content (20–30%). Furthermore, alkali metal and halogen levels in macroalgae are greater (0.5–11%) than in terrestrial biomass (1–1.5%). Nutrient content (N, P) is largely determined by macrophyte shape, followed by nutrient contamination in the environment.

Table 1. Algal sources suitable for bioethanol production with reference to their starch content

Algal Source	Starch Content of the Dry Matter	Reference
Ulva ohnoi	1.59% to 21.44% rising with nutrient starvation	(Meghanath Prabhu, 2019)
Saccharina latissima	50.0 (reserve food material)	(Adams, J.M., 2009)
Laminaria hyperborea	55.0 (reserve food material)	(Greetham, D., 2020 & Roesijadi, Guritno, 2010)
Chlamydomonas reinhardtii UTEX 90	53.0 (starch)	(Kim, M.S., 2006)
Chlorella vulgaris	12.0–17.0 (starch)	(Spolaore, P., 2006)
C. vulgaris	37.0 (starch)	(Horn, S.J., 2000)
Synechococcus sp.	15.0 (starch)	(Yusuke Sasaki, 2018)
Spirulina fusiformis	37.3–56.1 (starch)	(Rafiqul I.M., 2003)

Dr. Ashok Rathoure (asokumr@gmail.com)

Cultivation

The quantity of bioethanol that may be produced, both in absolute and relative terms, varies greatly across algae families and strains within identical ones. This is due to the fact that algae species and strains differ significantly relating to prolificity and multiplication, nutrition and light requirements, capacity to collect lipids or other desired chemicals, ability to adjust to unfavourable circumstances, and so forth. As a result, strains that have the ability to produce the most bioethanol, either directly or via biomass assembly, are frequently chosen.

Brennan and Owende (2010) compiled a list of desired features for strains of algae regarded as biofuel prospects, including:

1. Have tolerance for a broad range of temperatures due to seasonal and diurnal changes;
2. In open pond production settings, capable of dominating wild strains;
3. High ability to absorb CO2;
4. Nutritional needs are limited;
5. Possibility of providing useful co-products;
6. Quick production cycle;
7. Photosynthetic efficiency is high, and
8. Self- flocculation

As starch is used in ethanol fermentation as a substrate, a strain providing a large quantity of renewable energy due to high starch concentration is the characteristic feature when screening for algal strain used in the production of bioethanol. The total dry weight of biomass may be calculated, and biochemical tests can be used to assess the biomass starch/cellulose content.

Direct harvesting of seaweed from the maritime environment, wrack collecting from the beach, and culture of chosen seaweed species are the three principal sources of macroalgal biomass for downstream processing. Offshore, onshore, and integrated seaweed farming are the various ways of seaweed cultivation. Direct culture of macroalgae in saltwater is done using tethered ropes off the coast. It's also possible to integrate it with onshore aquaculture and offshore wind farm locations. Offshore farming provides for more controlled growing and harvesting circumstances, resulting in better efficiency and output than natural growth. To extract nutrients directly from the saltwater, in sheltered bays or lagoons macroalgae can be cultivated. Traditional seaweed growing methods include long lines, permanent off-bottom farming, and rock-based farming. For biomass production, large brown kelps are generally favoured. Smaller species, comparatively, are preferred for high-value components.

Enclosed photobioreactors and open ponds are the most prevalent production technologies for algae culture. Controlling downstream processing features, growth parameters, pollution, productivity, capital and operational expenses, water evaporation and so forth are all different aspects of production systems.

Harvesting of Algal Biomass

Harvesting the grown biomass can be done in two ways. It has long been a custom in many coastal areas. Techniques for harvesting include:

- Manual (Hand)

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

- Mechanical (Dredge, moving boat, mesh conveyor)

Three times a year, harvesting is usually carried out. Mechanical harvesting has a negative impact on marine ecosystems and stunts macroalgae development. In other cases, however, eliminating surplus nutrients from the environment by reducing prolific macroalgae growth is advantageous. Harvesting macroalgae blooms hasn't proven to be economically viable anywhere on the planet (Notoya, M., 2010).

Extraction of Carbohydrates

The extraction of energy from macroalgae may be classified in several ways, one of which being whether or not an initial drying phase is necessary. As a result, two separate groupings of processes emerge:

1. Energy extraction from dry macroalgae
    a. Pyrolysis;
    b. gasification (conventional);
    c. direct combustion;
    d. trans-esterification to biodiesel.
2. Energy extraction from wet macroalgae
    a. anaerobic digestion;
    b. fermentation to bioethanol or biobutanol;
    c. hydrothermal treatments.

Unfortunately, due to problems in processing technology and scaling up, bioethanol from second-generation feedstock has met with a lot of opposition. Cellulases degrade cellulose and hemicelluloses while lignin can prevent biodegradation, which is a major technical problem. Due to the lack of lignin in macroalgae, the conversion to ethanol from polysaccharides is more rapid in macroalgae. As a result, bioethanol determined from macroalgae are procuring popularity.

Brown, green, and red macroalgae are all forms of macroalgae that may be found in the ocean and have been used to make bioethanol. Because of their high carbohydrate content and ease of mass-cultivation, the predominant feedstock for bioethanol synthesis appears to be brown macroalgae. For example, a synthetic yeast platform can produce ethanol from brown macroalgal sugars at up to 83% of the theoretical maximum, but ethanol conversion from macroalgae at up to 50% of the theoretical maximum is regarded as ambitious (Elamathi Vimali, 2022).

Pre-treatment of the Seaweed Biomass and Hydrolysis of the Polysaccharides

Freshly harvested brown seaweed contains 15–20% carbs by weight, or roughly for every kg of wet weight it has 200 g carbohydrates, that is an acceptable concentration of substrate for conversion of microbial activities (Godvin Sharmila V, 2021). Moreover, seaweed does not require the pre-treatment that lignocellulosic biomass does to extract fermentable sugars since they don't contain lignin. Water is an easy way to extract laminaran and mannitol. Alginates (polymer blocks of Uronic and Guuronic acid) make up 30–40% of the macroalgae biomass. Calcium salt can be used to remove sodium alginate from the original extraction solution. This forms calcium alginate, which has a fibrous structure and is insoluble in water but may be isolated from it. To convert calcium alginate to alginic acid, the calcium alginate is

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

separated and suspended in water along with acid. The fibrous alginic acid formed is easy to separate and mix with alcohol and the other sodium carbonate is slowly added to the paste to the endpoint when all alginic acid is transferred into sodium alginate. Sodium alginate paste is extruded occasionally into pellets, which are later dried and ground. Dilution with a substantial volume of water is necessary due to the high viscosity. Alginate concentrations of less than 2% are used in the procedure. Processes involving the use of alginate as a fermentation substrate cannot be done with such a dilution. Water should be avoided if at all possible, as it increases the downstream processing costs.

Enzymatic hydrolysis and fermentation can be used together to produce bioethanol from cellulosic sources. Hydrolysis is more difficult for wet seaweed as alginates do not extract easily, resulting in enzymatic destruction of untreated organic materials from macroalgae, and it will make hydrolysis a rate-limiting step in the fermentation method. As a result, hydrolysis should be included in the biomass pre-treatment process. This hydrolysis can be done physically using grinders and emulsifiers, chemically with acid or alkali, or enzymatically.

Alginates can be degraded by a number of alginate lyases discovered by marine microorganisms. There are several ways for partial or total decomposition of alginate in the biomass through mechanical pre-treatment. Chemical hydrolysis should be based on current technologies, such as modifying and adapting techniques used for wood biomass pre-treatment while combining with steam treatment using acid and alkali procedure (Adams, J.M., 2009).

Dihydroxy benzene-driven Fenton reaction and brown-rot fungus, are the other known techniques, which partly depolymerize oxidise phenols, carbohydrates and other fermentation inhibitors as they create highly reactive hydroxyl radicals and alike oxidants. Nonetheless, combining mechanical and enzymatic hydrolysis to pre-treat algal biomass is the simplest and most environmentally friendly method.

Algal Biomass to Bioethanol

There are three ways of producing bioethanol from algae. Algae may absorb a large quantity of starch/cellulose from the biomass, which is transformed into sugars used for fermentation, which can then be turned into bioethanol by ethanol production. During dark fermentation, certain algae can produce ethanol. The present techniques for the production of bioethanol from macroalgae speices: SHF (separate hydrolysis and fermentation) and SSF (simultaneous saccharification and fermentation) are two types of seaweed hydrolysis and fermentation. The fermentation procedure is broken down into many parts. Seaweed biomass is hydrolysed first and then fermented by bacteria or yeast in distinct units in the case of SHF. SSF, on the other hand, does both hydrolysis and fermentation in one step. One of the most common strategies for obtaining high sugar yields from lignocellulosic biomass is to use acid pretreatment. By acid hydrolysis (0.4 M H2SO4 at 125 1C for 25 minutes), red algae, Palmaria palmata, yielded glucose, galactose, and carbohydrates, which were subsequently fermented to ethanol.

Despite the fact that acidic hydrolysis of biomass has been claimed to be the most economical technology until today, glucose breakdown happened while in the process. The by-products of acid hydrolyses, such as 5-hydroxy-methyl-furfural and levulinic acid, have a significant influence on the production of ethanol capability. Enzyme hydrolysis, like acid hydrolysis of carbohydrates, has various drawbacks, including difficulties extracting the derived enzyme from the acquired products and a protracted hydrolysis period. Saccharification has recently been aided by the use of a two-step biomass treatment procedure that combines acid and enzymatic pretreatment. Pretreatment with 0.06% sulfuric acid at 170 1C for 15 minutes, followed by enzymatic pretreatment, resulted in a maximum glucan concentration of

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

29.10%, which was four times greater than Saccharina japonica (raw). The digestibility of total biomass was 83.96%. At the moment, suitable enzymes are required for increasing hydrolysis effectiveness, and enzyme redemption and utilisation in biorefining processes also offer a guarantee. Separation of the membrane has been shown to be a reliable method for recovering enzymes.

Most polysaccharides and disaccharides are converted to monosaccharides after the effective hydrolysis phase; for example, sucrose can be catalysed by invertase enzyme into fructose and glucose, and subsequently, they are converted to ethanol by Saccharomyces ceveresiae. In red algae hydrolysates, the coexistence of glucose and galactose restricts total ethanol generation, while microorganisms in brown algae can't utilise several sugars at the same time as the capacity to utilise alginate is absent, therefore ethanol production is limited. As a result, the critical concern for bioethanol production from macroalgae monosaccharides through ethanol fermentation is an economical hydrolysis process.

CONCLUSION

In the coming future, research into prospective molecular processing using a range of different macroalgae species has found potential biochemical processing processes for the production of renewable energy. Macroalgae biomass varies depending upon the geographical area, species, and season, as do yields and productivity, which are heavily dependent on processing technology. As a result, macroalgae have the potential to make a large contribution to a sustainable and renewable economy. Conclusively, marine macroalgae are habitual of high salinity, huge temperature fluctuations, enormous nutrient dynamics, and extreme UV sunshine exposure. Due to the severe environment, their metabolism produces primary and secondary metabolites with distinct chemical structures in order to survive. The conversion of chemical energy from solar energy by macroalgae, mostly in the form of carbohydrates, is a normal photosynthetic organism. Because of their high carbohydrate content, they may be used to make alcohol or gaseous fuels. Furthermore, the distinctiveness of their chemical structure allows for the production of extensive carbohydrate-based compounds, including sulphated oligosaccharides and uncommon sugars, that have a potential market in the pharmaceutical and nutraceutical sectors. It also has the potential to be used in the synthesis of new materials with novel physicochemical features. Polyphenols, essential amino acids, and pigments are all found in macroalgae, as well as other important compounds. Integrating bioenergy production with valuable chemicals should make macroalgal bioenergy development more economically appealing since it provides possible additional revenue, high efficiency, and better environmental outcomes.

ABSTRACT

Development of sustainable energy resources is a major concern in front of the scientific community and stakeholders in this field. Invariably, fossil fuels are utilized to meet the major part of energy demand all over the world, but their stocks are limited. Burning of fossil fuels also causes significant environmental pollution that results in drastic climate change. There is an emergent need of an alternative to fulfill the current energy demand in a sustainable way along with sorting out the pollution issues. Microbial biofuels could be the most appropriate choice in this regard because it bears enormous potential that needs to be exploited. But it has some challenging issues to employ it to meet out the current energy demands. This chapter illustrates the microbial biofuels, harvesting techniques, different process, and potential to utilize them as sustainable energy sources along with considerable challenges that need to be addressed to make it an eco-friendly and economic fuel choice to pave the path of sustainable development.

INTRODUCTION

The scarcity of fossil fuel resources and the catastrophic environmental consequences caused by their use are major global concerns today. Fossil fuels have resulted in massive and long-term damage to our environment, including acid rain, global warming, and climate change. Greenhouse gas emissions continued to increase, and in 2010, they reached up to 30.6 gigatonnes (GT). The OECD (Organization for Economic Co-operation and Development) suggested that without implementing more effective policies than in force today, it will increase by another 50% by the end of 2050. It is anticipated that without taking appropriate measures, the atmospheric concentration of greenhouse gases would be reaching 685 ppm CO_2-equivalents by 2050. This is well above the 450ppm level of CO_2 required to have at least a 50% chance of increasing the global average temperature to 2°C. As per OECD predictions, the global average temperature is likely to exceed an increment of 2°C by 2050 and rises to 3 to 6°C greater than the pre-industrial levels by the end of this century. The United Nations Environment Programme (UNEP) "Emission Gap Report 2019", unless the greenhouse gas emissions must fall by 7.6% each year from 2020 to 2030, the world will fail to meet the 1.5 °C temperature reduction goal of the Paris agreement. (UNEP, 2019). Such a high rate of temperature rise would continue to change rain patterns and the melting of glaciers, leading to rising sea levels and worsening weather events. It could also exceed some critical "tipping points", resulting in dramatic natural changes resulting in irreversible or catastrophic events for natural systems and society (OECD, 2012). Also, fossil fuel reserves are depleting very fast. The growing economy needs fossil fuels to function, from the production of plastics and agricultural fertilizers to the energy requirements for heating, lighting and transportation services. Rapidly growing industrialization and the exploding world population are the driving force to become increasingly dependent on fossil hydrocarbons for economic growth (Ahmed et al., 2021). The fossil fuel demand is predicted to grow by 40% from 2010 to 2040 (Bhore et al., 2019). Fossil fuel reserves are insufficient to meet rising demand at the current consumption rate and will be exhausted soon. An overreliance on fossil fuel supplies challenges the world's energy security resilience. It will lead to a dwindling of fossil fuel resources and is expected to exhaust in less than 80 years (Rafa et al., 2021). The majority of the world's energy demand is fulfilled by fossil fuels (approximately 80%), with biofuels (11.3%), nuclear energy (5.5%), and other renewable energy sources, such as wind, filling in the gaps (2.2%) (Kopplaar, 2012). According to the International Energy Agency (IEA), biofuels will be contributing more to total energy sources by 2030. It could be expanded significantly if new petroleum fields are not accessed or substantial new alternatives are not identified (Hannon et al., 2010). Biofuels are among the most sustainable options. Biofuels and other renewable energy sources, such as wind and solar power, have attracted researchers, industrialists, and administrations to address energy shortages, rising crude oil costs, global climate change, and land and water degradation (Alam et al., 2015). This chapter entails a detailed description of microbial biofuels and their potential and contemporary challenges to make their most appropriate economically viable and sustainable choice of energy demands.

Biofuels

Biofuels have a zero-carbon footprint and are renewable fuels that are essential for environmental and economic sustainability. Any solid, liquid, or gaseous fuel derived from biomass (plants, animal waste, manure, sludge, etc.) stores solar energy through physical and chemical processes. This energy source can replace fossil fuels (Mobin & Alam, 2018). The usages of biofuels have several over conventional

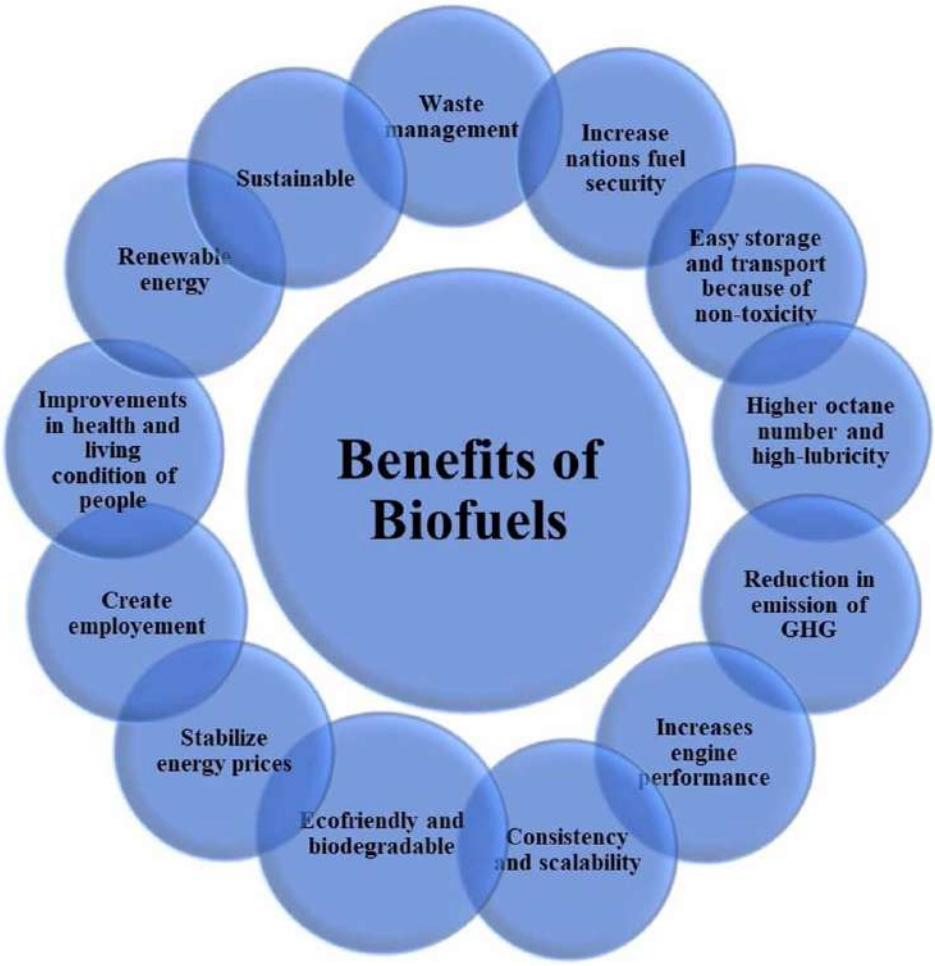
IP Address: 223.238.231.239

fossil fuels, as shown in **Fig. 1**. Biofuel can be converted to another variety of customized fuels as per the requirement. As reported by IEA in 2017, the annual global production of terrestrial and marine biofuels is estimated to be around 1,324 million tons of oil equivalents (International Energy Agency, 2017).

Figure 1. Benefits of biofuels over fossil fuels



Classification of Biofuels

The classification of biofuels is commonly categorized into two groups, namely primary (1þ) biofuel and secondary (2þ) biofuel. There is a further classification of secondary biofuel into three groups (as shown in **Fig. 2**) (a) 1stgeneration biofuel, (b) 2ndgeneration biofuel and (c) 3rdgeneration biofuels. Biofuels produced from oil crops have great potential as renewable and carbon-neutral alternatives to fossil fuels. But biomass, in the case of oil crops, used to produce biofuels, is part of human food stock that competes with the human food chain and causes a shortage of food, especially in developing countries (Alam et al., 2012)

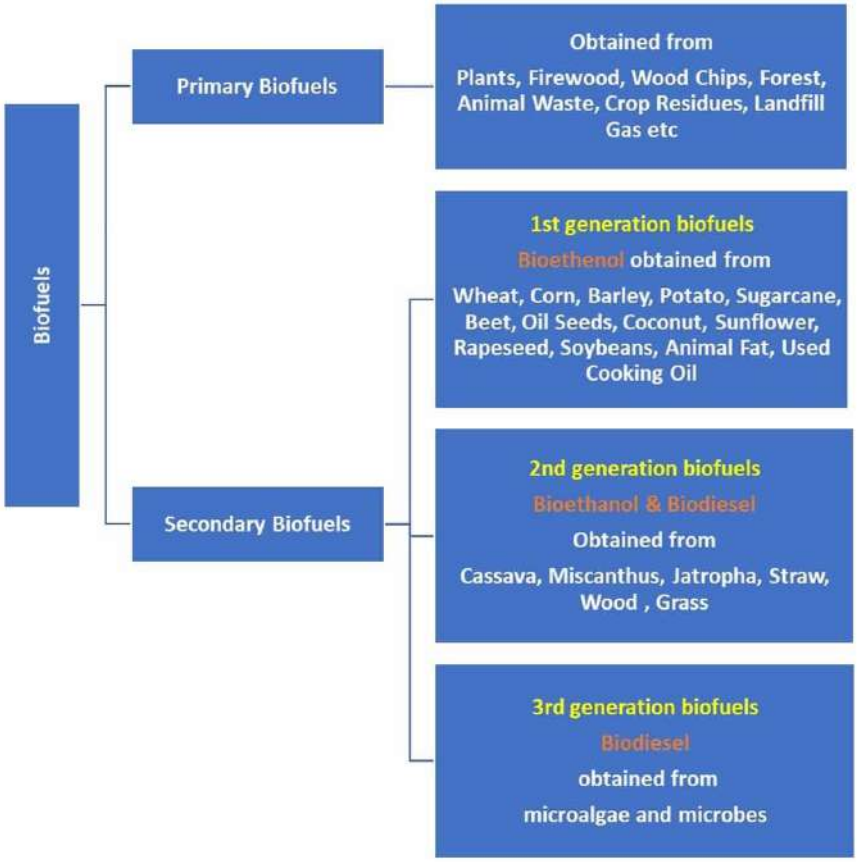
Figure 2. Types and sources of Biofuels
(Modified from Dragone et al., 2010)



Microalgae

Algae are photosynthetic autotrophs found in various water basins, including rivers, lakes, and oceans. Microalgae are unicellular or multicellular microorganisms found in marine and freshwater habitats. In comparison to plants, microalgae have basic structures and organs. It can undertake photosynthesis using sunlight, carbon dioxide, and water due to the existence of chlorophyll pigments involved in photosynthesis. Microalgae have a substantially greater average photosynthetic efficiency (6–8%) than terrestrial biomass (1.8–2.2%) (Aresta et al., 2005). Growing microalgae have various advantages, as shown in **Fig. 3**.

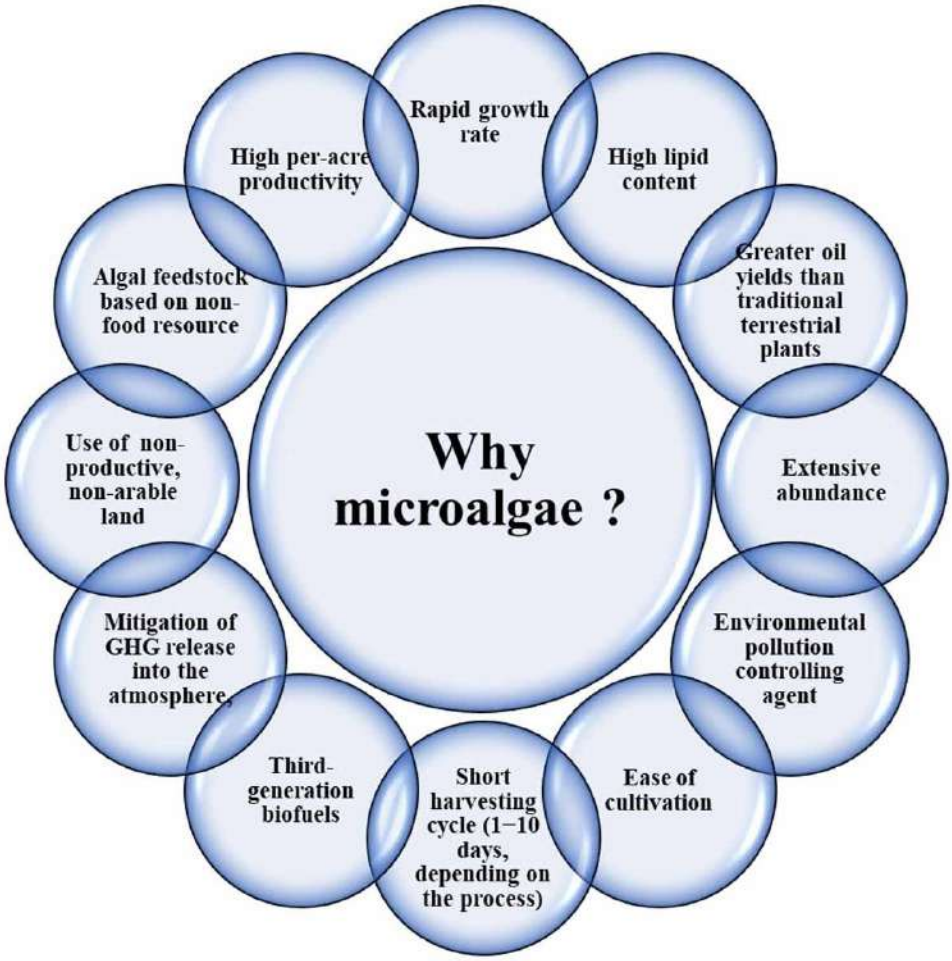
Figure 3. Advantages of growing microalgae as biofuel resources



It is microscopic and found in aquatic and terrestrial environments in a large community that can survive varied environmental conditions. Microalgae can grow faster under various metabolic conditions, including autotrophic, heterotrophic, mixotrophic, and photoheterotrophic, and demand three essential components: sunlight, water, and carbon dioxide. Geographically, microalgae strains can be exploited to produce biomass grow in tropical and subtropical climates with abundant year-round solar radiation and water (either from the sea or as groundwater) (Mobin & Alam, 2018). So, the tropical countries have a relatively more significant advantage in growing microalgae as a sustainable source for biofuels production. Because of their high lipid content, simplicity of cultivation, rapid growth rate, and volume at which they can be cultivated, microalgae have become appealing oil sources for the production of biofuels (Chisti, 2007). Producing microalgae has several benefits, including the feature that it does not compete with human or animal crop production and may be produced in non-agricultural fields as well as in saline water. Microalgae are an excellent replacement for industrial raw materials for biofuels production because of their high photosynthetic capability and ability to assemble many bio-products in their cells (Li & Yu, 2011). Microalgae have been employed as a biodiesel feedstock since the 1970s due

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

to their widespread abundance and higher oil content than regular terrestrial plants (Demirbas, 2009). A comparative account of microalgae with various other biofuels sources is given in **Table 1**.

Table 1. The table shows a comparative account of different sources of biofuels and their oil content(modified from Najafi et al., 2011).

S. No.	Crops	Oil Content (L/hac)	Oil Yield Relative to Microalgae (%)
1	Rubber seed	100	0.07
2	Corn	172	0.13
3	Soybean	446	0.33
4	Safflower	779	0.57
6	Camelina	915	0.67
7	Sunflower	952	0.70
8	Peanut	1,059	0.77
9	Canola	1,190	0.87
12	Jatropha	1,892	1.38
13	Karanj	2,590	1.89
14	Coconut	2,689	1.96
15	Oil palm	5,950	4.35
16	Microalgae (30% oil by wt)	58,700	42.88
17	Microalgae (70% oil by wt)	136,900	100.00

It is well clear from the table that the oil content (L/ha) in microalgae is much higher than other feedstocks available such as oil palm, coconut, jatropha, avocado and rapeseed/canola (Maity et al., 2014).

Types and Composition of Microalgae

Algae are divided into three main classes, i.e., Chlorophyceae, Phaeophyceae and Rhodophyceae. Chlorophyceae are also known as green algae due to chlorophyll a and b, e.g. *Chlamydomonas* and *Volvox*. Phaeophyceae are also known as brown algae. They possess chlorophyll a, Chlorophyll c, carotenoids and xanthophylls. Rhodophyceae is also known as red algae because of red pigment, i.e., r-phycoerythrin. Marine algae are commonly known as seaweed. Algae are featured as microalgae due to their microscopic size. Microalgae are single cellular photosynthetic cells. Microalgae are either prokaryotic such as cyanobacteria *(Chloroxybacteria),* or eukaryotic such as green algae *(Chlorophyta)*(Mathushika & Gomes, 2022). At least 30,000 species of microalgae have been identified. (Mathushika & Gomes, 2022). Different types of associations of microalgae form large structures called colonies. Colonies may be heterogeneous groups formed by eukaryotic species like diatoms and bacteria and prokaryotic organisms like cyanobacteria.

Microalgae species can produce up to 58,700 L of oil per hectare (Mobin & Alam, 2018). Subsequent studies have identified the micro-algal species, such as *Botryococcusbraunii*, *Scenedesmus obliquus, Chlorella vulgaris, Chlamydomonas reinhardtii, and Nannochloropsisoculata,* that are recognized as

IP Address: 223.238.231.239

promising species for the production of biofuel (Veeramuthu & Chawalit Ngamcharussrivichai, 2020). All three biochemical fractions of microalgae (lipids, carbohydrates, and proteins) can be converted into fuels (Ghasemi et al., 2012). The fatty acid profile of microalgae species greatly favours biodiesel production (Qari et al., 2017). The major constituents of microalgae are lipids varying from 2–23%, proteins (6–52%), carbohydrates(5–23%) and some fat (Brown et al., 1997). Green micro-algae have a significantly higher lipid synthesis rate (mg/L/day) than red or blood-red micro-algae (Mobin& Alam, 2018). Microalgae lipid fraction consists of both neutral lipids and polar lipids. It accumulates triacylglycerols under stress conditions. Microalgae are rich in polar lipids in the exponential stage of development. Some microalgae have high protein concentrations in terms of quantity, up to 58% for *Chlorella vulgaris* on a dry weight basis. Carbohydrates (complex polysaccharides) are the main structural characteristics of the cell wall. The energy storage products of microalgae are glucose, starch and fat. Microalgae contain both saturated and unsaturated fatty acids. The lipid content of microalgae species varies from 20% to 50% of dry biomass (w/w). The most productive and cultivable microalgae and their respective lipid content are in **Fig. 4.**

Figure 4. Figure depicting different algal species and their respective lipid content (in percent)

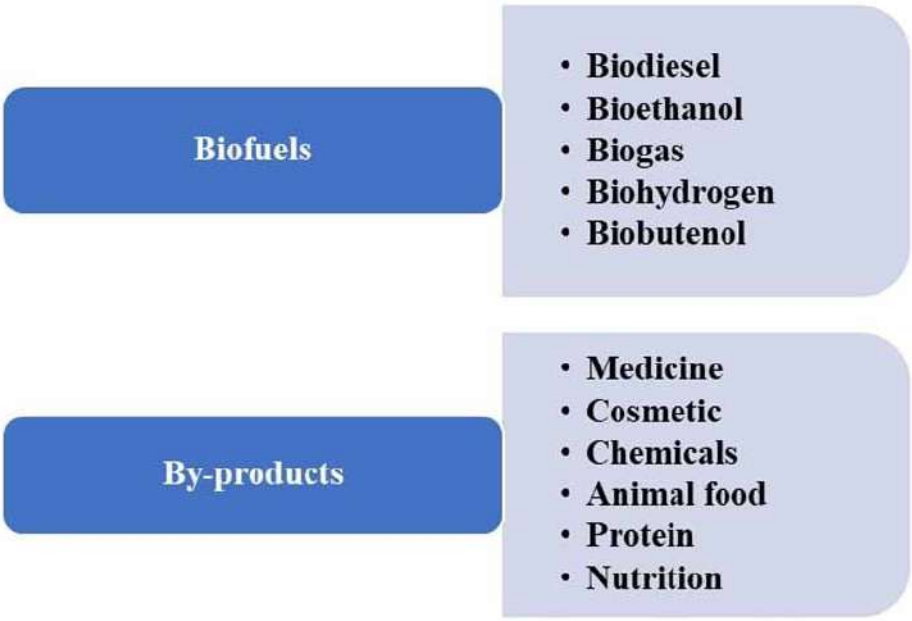
Complementary Algal By-Products

Along with the production of biofuels, microalgae have a variety of by-products with significant economic value. Following lipid extraction, the residual microalgae, i.e., dry biomass/cake, can be used as livestock feed, organic fertilizer due to its high nitrogen and phosphorus content, or merely burned for fuel co-generation (Jain et al., 2004). In addition, the resulting dry algal cake can be used to reduce the quantity of coal needed in thermal power plants. Furthermore, algal biomass has a better calorific value and lower SO_x concentration in flue gas when compared to coal. The calorific value of algal biomass is around 28,000kJ/kg, whereas the calorific value of typical high-quality coal is 27,000kJ/kg (Sudhakar & Premalatha, 2012). The algal by-products are used in different sectors, as shown in **Fig. 5.**

Figure 5. Different kinds of biofuels and by-products are produced from microalgae



Direct photolysis, indirect photolysis, and an ATP-driven pathway have all been developed as methods for producing hydrogen. The single-cell green algae *Chlamydomonas reinhardtii* has been studied extensively for photo-biological hydrogen generation. In sulfur-limited and anaerobic conditions, the starch in algal cell walls is converted to hydrogen. Because of the quantity of carbohydrates/polysaccharides and thin cellulose, algae are a better source of bio-ethanol production (Mathushika & Gomes, 2022), e.g. *Chlorococcumlittorale*, marine green algae produce ethanol under dark fermentation. Brown algae are remarkable feedstock for the development of ethanol because they have high carbohydrate content. Algal bioethanol prevails over the disadvantages of first-generation and second-generation bioethanol.

Current Tools and Techniques to Grow and Harvest Microalgae

Currently, industrial production of microalgae is small, estimated to be around 6000 tons (dry weight) per year worldwide (Maity et al., 2014).

The equation below shows that microalgae require essential environmental components to grow and synthesize raw material for biofuels.

$$\text{Light} + CO2_{+} H2O_{+} \text{nutrients lipids+proteins+carbohydrates}$$

Essential requirements of nutrients from the environment are carbon, phosphorus, nitrogen, and iron, and some minor are calcium, potassium, magnesium, manganese, sulphur, copper, zinc, and cobalt (Chisti, 2007). The temperature requirement must be within the range of 20°C- 30°C. The microalgae cultivation methods are mainly categorized into ways 1. Suspended cultivation. It includes 1a) open ponds and 1b) closed photobioreactors 2. Immobile cultivation. It includes 2a) immobile matrix cultivation and 2b) bioðlms cultivation. Different types of techniques used to cultivate microalgae are illustrated in Fig**. 6. The** industrial-scale of microalgae production utilizes a continuous suspended culture technique during the daytime. This method needs to feed a new culture and continuously remove the same quantity of culture from the system. The biomass is generated during the day; out of that, approximately 25%biomass lost during nighttime due to respiration failure and sufficient unavailability of growth nutrients, temp. and sunlight (Chisti, 2007). Open ponds or Raceways are also the most widely used methods of microalgae production on a large scale because this system is a shallow and open, equipped circulating wheel which provides adequate mixing and circulation of nutrients. These setups are economically suitable to build and run but face relatively lower production due to uncontrolled conditions(Mata et al., 2010). These systems have been utilizing microalgae biomass production for the last sixty years (Tredici & Materassi, 1992). The open ponds are shallow, not deeper than 30 cm, to allow sunlight for microalgae growth. Therefore they become easy to operate and economically viable but confront some disadvantages (Chisti, 2007). A paddlewheel creates mixing and circulation in raceways, and it works continuously to prevent sedimentation. However, open systems are generally simple to operate and use solar energy as an energy source; they have several drawbacks, including the need for a vast area to cultivate, unregulated environmental conditions which change seasonally and diurnally, water evaporation, comparatively unequal carbon dioxide and light distribution in the system, and high exposure to contamination or infection that is difficult to control. To grow in such fluctuating environmental conditions, the extremophilic strain of microalgae is required to cultivate. Normal species having a high production rate face low productivity in the case of an open pond system.

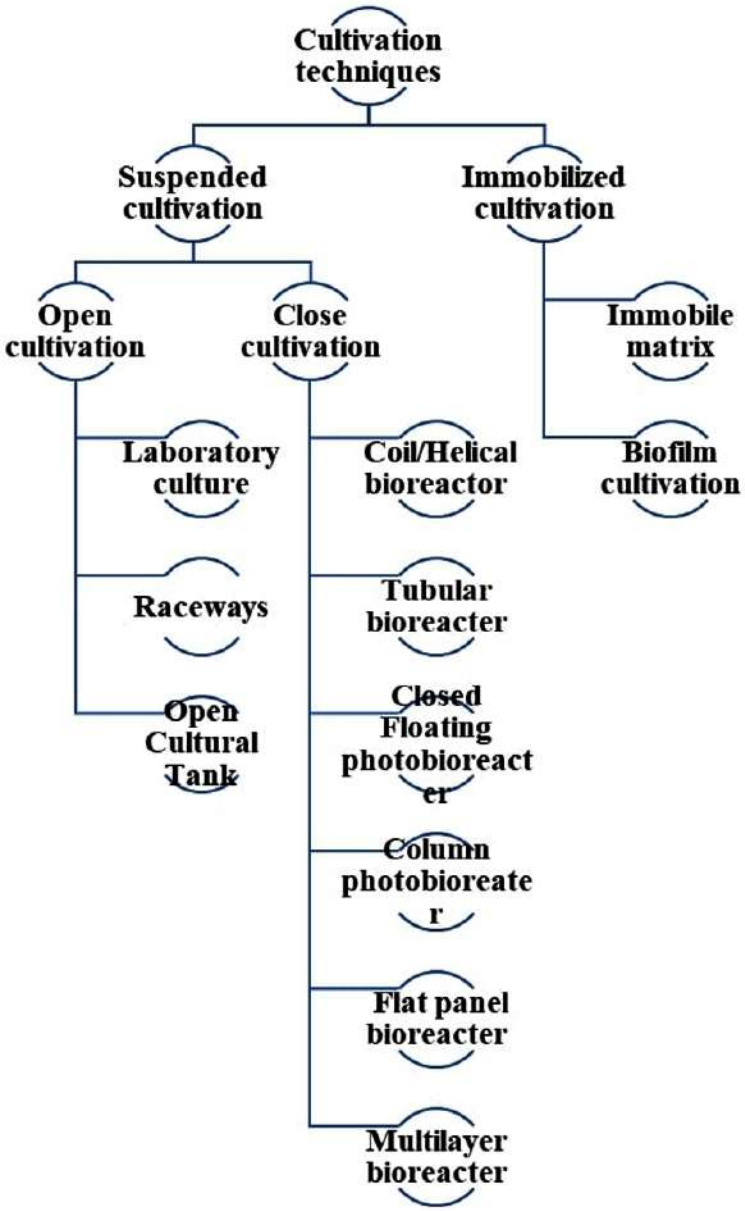
Figure 6. Techniques used to grow microalgae



Photobioreactors are considered to be most productive for microalgae cultivation as compared to open pond or raceways systems because of better controlled medium parameters like temperature, pH, nutrient addition, efficient mixing, better control over contamination or infection, low water evaporation and a large number of cells per unit area (Lundquist et al., 2010, Carvalho et al., 2006, Kunjapur & Eldridge, 2010, Darzins et al., 2010, Lam et al., 2019). Photo-bioreactors can also be customised per the specific strain of microalgae to enhance productivity in every possible way and better control environmental fluctuation. But these reactors are energy-intensive and expensive to build, making biofuels economically infeasible (Mata et al., 2010). Photobioreactors are made up of transparent glass or

plastic tubes with £ 0.1 m in diameter. Based on different closed structures, photobioreactors are of the following type 1) vertical, in that tubes are parallelly arranged vatical to ground. 2) Horizontal, in that tubes or plates are parallel to one another but horizontal to the ground 3) helical, in that tubes are making coiled structure around a supporting frame. They are considered easy to increase the production, up to 13 times more than raceways (Chisti, 2007). But every system has its advantages and disadvantages. To increase the production of microalgae, the surface area needs to be improved, increasing sunlight exposure. This could be achieved by making tubes thinner and plates broader, increasing the surface area to volume ratio. Zemke et al., 2016 reported that a doubling of volume had doubled the microalgal biomass production, but built-up cost increases only 59% of the initial. In the case of phototropic open culture doubling surface area increases the capital cost by 100%, but it has the advantage of using free energy; otherwise, it requires a significant investment cost to provide it (Zemke et al., 2016). The significant disadvantages of photobioreactor are the recovery of biomass, but this issue was resolved up to a great extent by biofilm or immobilized matrix cultivation system (Alam et al., 2015, Hoffmann, 1998). Open ponds or raceways are also preferable for microalgae cultivation due to their low capital cost and relative ease of operation. The current technologies are not economically suitable and capable enough to compete in the market. To cut down its production cost and improve harvesting and processing techniques, optimising the utilization of wastewater as algal culturing feed is required. Various studies have considered the most appropriate environment-friendly and economically viable method to produce biofuel and other complementary products with significant economic value.

But the use of wastewater as microalgae feed faces significant challenges, which include high turbidity causes improper penetration of sunlight in the medium, overdose of nutrients which also hinder the algal growth, the suitable strain of microalgae required to cope with up wastewater environment, and essential requirement of freshwater to dilute the waste etc. Different techniques, methods, and strategies are described (Mobin & Alam, 2014, Dragone et al., 2010, Chisti, 2007, Scott et al., 2010, Kumar & Bharadvaja, 2020). Harvesting has also been a challenging task after cultivating microalgae because it costs up to 30% of the total production cost of microalgae biofuel(Grima et al., 2003). Various methods presently employed to harvest microalgae include mechanical, physical, chemical, biological and electrical processes such as centrifugation, ultra-filtration, floatation, auto flotation and flocculation, etc. (Dragone et al., 2010). The flocculation is utilized when algae size is comparatively small. Flocculants like ferric chloride, aluminium sulphate and ferric sulphate are used—moreover, different combinations are employed for efficient harvesting. Centrifugation is used to separate suspended microalgae, and the medium is decanted. This is considered the most reliable method for separating microalgae from the medium(Christenson & Sims, 2011). Suspended culture is passed through the filter in filtration until a thick layer of microalgae biomass is formed. An electrical method is based on separating algal cells under an electric field, but the low-cost method is required to do this task efficiently.

Different Processes to Produce Microalgae Biofuel

Several processes are available to convert microalgae biomass into different types of energy. It has the following method (1) direct combustion, (2) chemical reaction, (3) thermochemical conversion (4) biochemical conversion. The different processes of microalgae biomass conversion and resulting products are shown in **Fig.7**_(Wang et al., 2008). Along with the production of biofuel, some other complementary products also can be produced, and their detailed description can be obtained from these

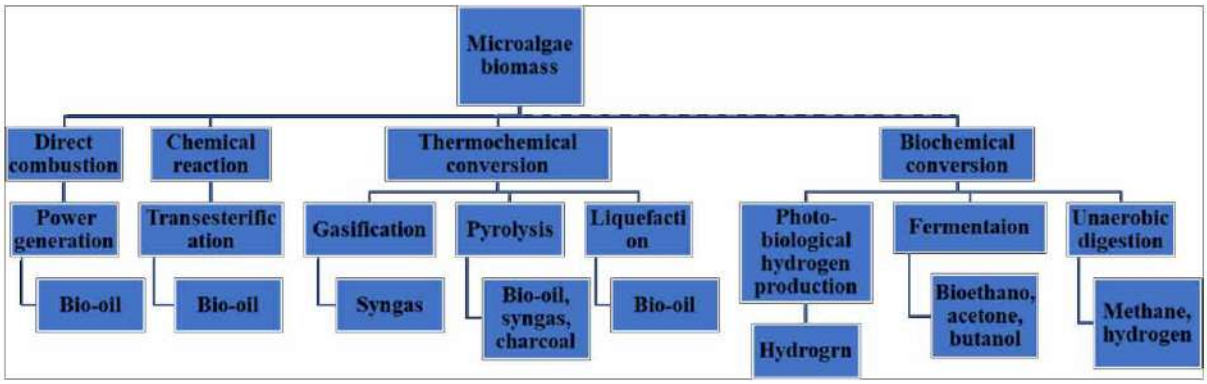
sources(Dragone et al., 2010, Spolaore et al., 2006, Benemann et al., 1987, Eriksen et al., 1998, Harun et al., 2010, Mendes-Pinto et al., 2001).

Figure 7. The different processes of microalgae biomass conversion and resulting products
(Modified from Dragone et al., 2010)



Potential and Challenges

Microalgae can utilise CO_2 emitted from thermal power plants with higher than 10% enhanced photosynthetic efficiency compared to 0.5% of terrestrial plants (Khan and Rashmi, 2008).

It is estimated that microalgal biomass of one kilogram can fix 4.8 kg of CO_2 (Baral et al., 2015). So, microalgal cultivation with sequestration of CO_2 emitted from the thermal power plant and production of value-added products, including biodiesel, make them an efficient and carbon-neutral alternative for energy production. Several pilot studies of microalgae cultivation using emitted CO2is going on worldwide, including Stanwell Power Plant in Queensland, Loy Yang Power Plant in Victoria, and Eraring Power Plant in New South Wales. Due to technical challenges and higher capital costs of solar and wind energy utilization, third-generation algal biofuel can play an essential role in filling the partial gap left by reducing fossil fuel utilization. However, some fundamental limitations must be solved to obtain the maximum potential of third-generation biofuels derived primarily from microalgal biomass.

The following are real challenges:

1. Technological constraints in microalgae selection, culture, harvesting, processing, and distribution techniques. The development of microalgae strains that are high yielding, broad temperature tolerant, and salinity tolerant is a challenge. Commercial-scale microalgal production lacks a cost-effective, consistent culture and harvesting process and system. The available mechanical and chemical technologies for extracting biofuels are not economically sustainable. Compared to conventional methods, the expense of infrastructure for biofuel distribution and retailing is also a challenge.
2. Microalgae cultivation also faces significant obstacles in terms of land availability and agricultural inputs. Commercial-scale microalgae cultivation cannot wholly utilise arable land and freshwater resources, which would pose a danger to human and animal food demand. Excessive use of agricultural additives (inorganic and organic fertiliser) in algal mass production can lead to eutrophication when phosphate and nitrate levels rise.

3. Gene modification remains a barrier, even though detailed information can assist. Comprehensive perception of microalgal biology, genetic manipulation, and gene cloning are all challenges that must be addressed to improve photosynthetic efficiency, metabolic activity, temperature tolerance, and algae biomass output and oil content.
4. Wastewater utilization for microalgae cultivation remains a concern due to the lack of a well-developed and cost-effective procedure for screening out toxic and undesired substances that can interfere with algal growth.
5. A significant amount of investigation and innovation is necessary to use value-added by-products such as bio-fertilizer, animal feed, cosmetics, colouring agents, chemical and pharmaceutical commodities, biogas masses, and biofuel generation.
6. Currently, biofuels' production cost is significantly higher than fossil fuel prices. So, it is highly challenging for biofuel to be competitive in the market.

CONCLUSION

Sustainable energy sources for the growth and development of the world are a mindboggling task in front of the scientific community. Fossil fuels are not environment friendly and have limited stocks, which will be exhausted soon. Biofuels are emerging areas of sustainable, potential energy sources that need to be exploited to meet growing energy demands in this chaos. Microalgae are a flexible biofuels source with significant potential to produce different biofuels. Microalgae are considered a carbon-neutral fuel due to the capability to utilize wastewater as a feed to grow, co2 from a thermal power plant with enhanced photosynthetic capacity, and the production of various complementary by-products with significant economic benefits values. Still, multiple gaps need to be addressed to commercialise fuel production using microalgae, including efficient technologies that harvest, process, and convert it into economically viable biofuels. Systematic and comprehensive research is required in this regard. Presently, microalgae biofuels face significant challenges, including high performance, broad range tolerating and high yielding microalgae strains, improved culturing techniques, reduction in production cost, utilisation of waste to compete in markets, and improved harvest and processing techniques to make economically viable source.

Chapter 14
Microbial Cellulase in the Production of Second Generation Biofuels: State-of-the-Art and Beyond

Jovana Trbojević-Ivić
https://orcid.org/0000-0003-0984-9193
Innovative Centre, Faculty of Chemistry, Belgrade, Ltd., Serbia

ABSTRACT

Bioethanol from inedible cellulose-rich biomass is the most promising candidate to replace fast depleting, environmentally polluting fossil fuels. Hydrolysis of cellulose to glucose is the crucial step in its biotransformation to bioethanol. Enzymatic hydrolysis is favored over acid hydrolysis, as enzymes are eco-friendly biocatalysts with high substrate specificity and superior catalytic efficiency in mild reaction conditions. Complete hydrolysis of cellulose is achieved by cellulase. Higher cellulase production yield, stability, and catalytic efficiency are the main attentive points for the successful implementation in industrial production of bioethanol. This chapter will highlight general characteristics of microbial cellulases and their role in the bioconversion of cellulose to biofuels, economic sustainability of cellulose-based biofuels, and the latest innovations in cellulase immobilization as the most comprehensive strategy for improvement of enzyme stability, activity, and reusability for cost-effective large-scale application.

INTRODUCTION

In 2016 the use of bioethanol-gasoline blends in transportation reduced the emission of carbon dioxide by 43.5 million tons, the equivalent of removing 9.3 million cars from the road for the entire year (Robak & Balcerek, 2018). Lignocellulose biomass is the most abundant and renewable source of carbohydrates in the biosphere. It is obtained from inedible energy crops, agricultural and industrial waste (Kricka et al., 2015; Verma & Kumar, 2021). Bioethanol from lignocellulose biomass is a second-generation biofuel, whose production does not compete against food supplies, in contrast to the first-generation bioethanol,

produced from edible seed-derived starch. Accordingly, second-generation bioethanol is the most promising candidate to replace conventional gasoline in the near future (Hoffman et al., 2021; Horn et al., 2012). Enzymes are green biocatalysts with remarkable substrate specificity and catalytic efficiency in mild reaction conditions. They can be genetically or chemically modified to meet the specific requests of the biotechnological process in which they are employed (Ejaz et al., 2021; Trbojević et al., 2013). Enzymatic hydrolysis of cellulose to glucose is the critical step in production of the second-generation bioethanol. Complete hydrolysis of cellulose is achieved by concerted activity of endoglucanase, exoglucanase (cellobiohydrolase) and β-glucosidase, which form a multi-enzyme cellulase complex. Mesophilic and thermophilic bacteria and fungi are the major industrial cellulase producers (Acharya & Chaudhary, 2012; Bhardwaj et al., 2021; Contreras et al., 2020; Horn et al., 2012; Menendez et al., 2015; Srivastava et al., 2018; Verma & Kumar, 2021). Commercial cellulase cocktails have contributed to the significant cost-reduction of cellulose bioconversion to bioethanol (Bhardwaj et al., 2021; Contreras et al., 2020; Lamichhane et al., 2021). However, further decrease in cellulase price is necessary by improving cellulase production yield, stability, specific activity and catalytic efficiency for economically viable bioethanol production.

Immobilization is the strategy of choice for improving catalytic performance of industrial enzymes, since it encompasses significant biocatalyst stabilization and reusability. Enzyme reusability significantly reduces the cost of the biocatalyst application at industrial scale and can be achieved exclusively by immobilization (Milosavic et al., 2016; Trbojević et al., 2013). With myriad of possibilities regarding immobilization methods and the choice of immobilization support, cellulases can be tailored for cost-effective and optimum catalytic performance. This chapter is a comprehensive overview of current state-of-the-art in the industrial application of cellulases in biofuel production. It will provide detailed fundamental understanding of microbial cellulases and their critical role in bioconversion of cellulose to bioethanol. Furthermore, the techno-economical aspect of the cellulose-derived biofuels will be discussed, with additional analysis of COVID-19 impact. The separate section of the chapter will be dedicated to cellulase immobilization and its effect on enzyme stability, activity and reusability. It will specifically deal with nanomaterials as innovative immobilization carriers, having in mind their increasing popularity in this area of research and application.

BACKGROUND

Lignocellulose biomass is a complex mixture of carbohydrate and non-carbohydrate compounds. Cellulose is the dominant component (40-60% of the total biomass weight), followed by hemicellulose (20-40%) and lignin (20–30%). It also contains proteins, lipids, pectin, minerals and soluble sugars (Adegboye et al., 2021; Horn et al., 2012; Kricka et al., 2015). Structure of major constituents of lignocellulose biomass is represented in Figure 1.

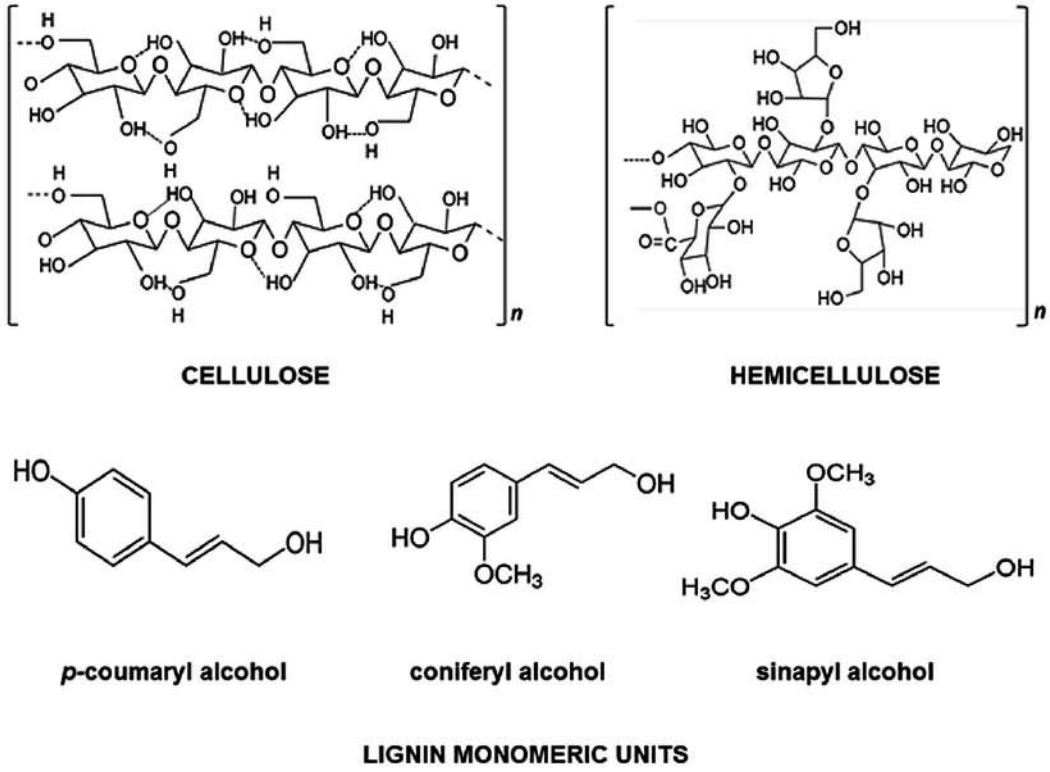
Figure 1. Constituents of lignocellulose biomass
Source: (Adegboye et al., 2021; Horn et al., 2012; Kricka et al., 2015; Mohanram et al., 2013; Zoghlami & Paës, 2019)



Cellulose is a linear homopolysaccharide of β-D-glucopyranose units linked by β-(1,4)-glycosidic bond. Its structure is stabilized into microfibrils by numerous hydrogen bonds and van der Waals forces. Each microfibril contains up to 36 glucan chains with thousands of glucose units (Mohanram et al., 2013). Consecutive sugars along chains in crystalline cellulose are rotated by 180°, meaning that cellobiose is the fundamental building block (Kricka et al., 2015). Cellulose can be crystalline or amorphous. Individual glucan fibrils in crystalline cellulose are tightly packed and hardly accessible to enzymes or solvents (Adegboye et al., 2021). Depolymerization of cellulose induces changes in its crystallinity and porosity (Zoghlami & Paës, 2019).

Hemicellulose is heteropolysaccharide, composed of xylose, arabinose, rhamnose, galactose and mannose. It can also contain glucuronic, galacturonic and methylgalacturonic acid (Adegboye et al., 2021). Common hemicelluloses are xylan, mannan and xyloglucan. Hardwood xylans contain β-(1,4)-linked xylose backbone with a high amount of methylgalacturonic acid, while grass xylan is more complex with high amounts of arabinose and ester modifications with hydroxycinnamic acid. Hydroxycinnamic acids can also cross-link adjacent xylan chains, building a more complex and rigid structure (Horn et al., 2012). Degree of hemicellulose polymerization is lower than of cellulose, therefore hemicellulose is amorphous with little physical strength (Zoghlami & Paës, 2019). Lignin is hydrophobic heteropolymer of coniferyl, sinapyl and p-coumaryl alcohol, linked *via* C-C and C-O-C links. In lignocellulose biomass lignin is cross-linked with carbohydrates by ether or ester linkages which provides structural integrity

IP Address: 223.238.231.239

of plant cell walls and hinders the enzymatic hydrolysis of biomass, a phenomenon known as biomass recalcitrance (Adegboye et al., 2021; Horn et al., 2012; Verma & Kumar, 2021).

Endoglucanase (EC 3.2.1.4, systematic name: 1,4-β-D-glucan-4-glucanohydrolase), exoglucanase (EC 3.2.1.91, systematic name: 4-β-D-glucan cellobiohydrolase; EC 3.2.1.74, systematic name: 4-β-D-glucan glucohydrolase) and β-glucosidase (EC 3.2.1.21; systematic name: β-D-glucoside glucohydrolase) form multi-enzyme machinery for complete hydrolysis of cellulose. Aerobic bacteria and fungi produce individual cellulases, which are further combined in biocatalytic cocktails with a precise share of each individual enzyme for efficient hydrolysis (Acharya & Chaudhary, 2012). Microbial cellulases have a two-domain structure, consisting of cellulose-binding domain and catalytic domain, connected by flexible hinge (Ejaz et al., 2021). Hinge region is rich in proline, threonine and serine and enables the enzyme to move along cellulose fibril in a caterpillar-like mode. Detailed data of microbial cellulase structure were obtained from model systems: endoglucanase from *Thermoascus aurantiacus* (Cel5A), cellobiohydrolase from *Phanerochaete chrysosporium* (Cel7D) and β-glucosidase A from *Bacillus polymyxa*. Polypeptide chain of Cel5A is organized into a very compact eight-fold β/α-barrel with short loops and it contains only catalytic domain. Its active site contains acid/base glutamate 133 and nucleophilic glutamate 240. Substrate-binding site of Cel5A is shallow and long, delineated with tryptophans 170, 174, 273, 278 and 279 (Lo Leggio & Larsen, 2002). Catalytic domain of Cel7D is organized in a β-sandwich with antiparallel β-sheets, stabilized by hydrophobic interactions and disulfide bridges. In comparison to *T. reesei*, active site is more open, however not as open as in endoglucanase. Nucleophilic glutamate 207, acid/base glutamate 212 and proton donor aspartate 209 form catalytic triad of Cel7D, located in the tunnel-shaped active site, delineated with tryptophan and additional aromatic residue from tyrosine 47 at the tunnel entrance (Muñoz et al., 2001). β-Glucosidase from *B. polymyxa* is octamer, organized into α/β barrel, stabilized by fourteen hydrogen bonds. Loops A, B and C connect individual parts of the α/β barrel. Length and chemical nature of these loops governs substrate specificity of β-glucosidase. Most significant differences were observed in the loop C, a part of the substrate-binding cavity whose end is in a close proximity to the non-reducing end of cellobiose. Substrate-binding cavity of β-glucosidase A is wider and more extended, so that it can accommodate larger substrates than cellobiose. Interesting mechanistic attribute of glucosidases, including β-glucosidase, is the ability to catalyze synthesis of disaccharides and oligosaccharides from glucose in transglucosylation. Hydrolysis *vs* transglucosylation is regulated by the water content in the reaction mixture (Pavlović et al., 2013; Veličković et al., 2014). Concerted action of individual cellulases in cellulose hydrolysis is depicted in Figure 2.

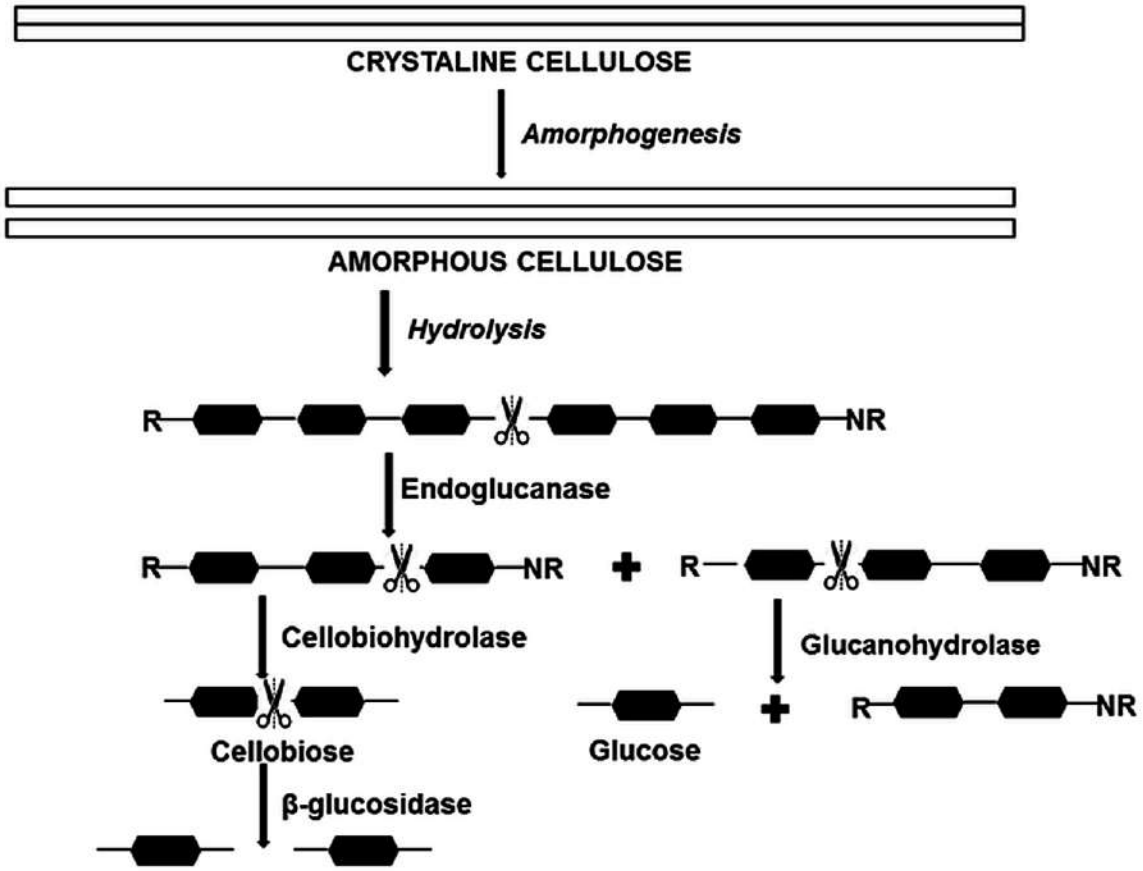
Figure 2. Enzymatic hydrolysis of cellulose
Source: (Adegboye et al., 2021; Barcelos et al., 2015; Ejaz et al., 2021; Horn et al., 2012; Mohanram et al., 2013; Tiwari et al., 2018)



Cellulose hydrolysis is initiated by random attacks of internal sites in amorphous regions in cellulose by endoglucanase, resulting in rapid depolymerization (Barcelos et al., 2015; Ejaz et al., 2021). Exoglucanases then attack non-reducing or reducing ends of the glucan chain, releasing cellobiose or glucose, respectively (Adegboye et al., 2021). Exoglucanases acting on non-reducing ends are called cellobiohydrolases and they are the dominant component of cellulase cocktails *(*Adegboye et al., 2021; Horn et al., 2012*)*. Exoglucanases, acting on reducing ends are called glucanohydrolases (Mohanram et al., 2013). In the final step, β-glucosidase attacks the non-reducing end of cellobiose, yielding glucose. Hydrolysis of cellobiose is the rate-limiting step of the overall process, making β-glucosidase the key regulatory enzyme in cellulose hydrolysis (Tiwari et al., 2018). β-Glucosidase is strongly inhibited by glucose, with the exception of β-glucosidase from *Aspergillus oryzae* (Barcelos et al., 2015). Synergism of cellulases is influenced by physical and chemical heterogeneity of the substrate, access of the substrate to the active site of the cellulose-processing enzymes and ratio of individual cellulases in the enzyme cocktail. Low content of endoglucanase and high content of cellobiohydrolase provide the best synergy in the catalytic process and the highest glucose yield (Contreras et al., 2020).

Natural and genetically modified fungi and bacteria have been heavily exploited for production of industrial cellulases. Fungal cellulases are more common, due to high productivity of engineered strains (>100g protein/liter of cell culture), which secrete the enzyme to the medium for easy extraction and purification (Mohanram et al., 2013; Srivastava et al., 2015). On top of that, *Escherichia coli*, the most common host for heterologous expression of proteins, suffers from several significant limitations in cellulase production. Thick outer membrane of *E. coli* or impaired transport across the membrane due to degradation of linker sequence result in limited secretion of the target enzyme. Formation of inclusion bodies further complicates isolation and purification of the target enzyme and often leads to its inactivation. Solution can be found in genetic engineering of cellulolytic bacteria, *Bacillus subtilis* or *Clostridium thermocellum* for homologous expression of cellulases. However, high production costs and need for enriched media limit this approach (Menendez et al., 2015). On the other hand, a significant drawback of fungal systems is the deficiency of a specific cellulase. *Hypocrea jecorina* (*T. reesei*) cellulase mixture is rich in cellobiohydrolase, but low in β-glucosidase. The opposite is true for *Aspergillus niger*. Therefore, in order to produce the complete and effective cellulase system, several fungal strains need to be employed, which is not user-friendly nor cost-effective (Srivastava et al., 2015). Apart from that, bacteria have higher growth rate than fungi and produce cellulases of higher stability (Mohanram et al., 2013).

Submerged and solid-state fermentation are the two main methods for large-scale production of cellulases, using lignocellulose biomass as a growth medium for inducible cellulolytic microbial producers. Submerged fermentation is a well-established technology for large-scale production of fungal cellulases in which water is abundant in fermentation mixture, resulting in reduced oxygen, temperature and nutrient concentration gradients and facilitated enzyme recovery. However, low enzyme yield and additional costs of dewatering during enzyme purification are key limitations of this strategy. Solid state fermentation is essentially a one-pot system for cellulase fermentation and production of bioethanol from lignocellulose biomass. It is performed without free water in the system, but with ample amount of moisture. Accordingly, solid state fermentation is cost-effective and time-saving method for high-yield production of bioethanol in lower reactor volume, lower enzyme loading and lower requirement for sterile conditions. The major bottleneck of this method is reaction temperature: in saccharification step temperature is maintained at 50^{o}C, while during bioethanol production temperature is maintained between 28 and 37^{o}C. Therefore, thermotolerant enzymes are necessary to endure this process (Bhardwaj et al., 2021; Dey et al., 2020). Table 1 summarizes the leading market suppliers and characteristics of commercial cellulase preparations.

MAIN FOCUS OF THE CHAPTER

In this section following topics will be discussed in detail:

- Bioconversion of lignocellulose biomass to bioethanol
  - Fundamental aspects and the main phases of bioethanol production
  - Process parameters influencing lignocellulose bioethanol yield
- Techno-economic analysis of bioethanol as an alternative fuel
  - Economic segments of global bioethanol market
  - Impact of COVID-19 on economic viability of bioethanol
  - Co-relation of global cellulase market and global bioethanol market.

Accordingly, this section will address actual issues, which need to be taken into an account from both scientific community and industry when considering bioethanol as transportation fuel of the future.

Bioconversion of Lignocellulose Biomass to Bioethanol

Bioconversion is a complete transformation of complex lignocellulose biomass to bioethanol as a final product. It is a multiphase process, as presented at Figure 3.

Figure 3. Bioconversion of lignocellulose biomass to bioethanol

Pretreatment of Lignocellulose Biomass

The main purpose of pretreatment is to reduce the biomass recalcitrance by removal of lignin and hemicellulose and to promote amorphogenesis of cellulose to make it more accessible for hydrolysis. Methods of lignocellulose biomass pretreatment can be physical, chemical, physicochemical and biological, as indicated in Table 2.

Table 2. Pretreatment of lignocellulose biomass

Type of Pretreatment	Method	Reaction Conditions	Remarks
Physical	Mechanical comminution	Chipping, grinding, milling	Reduction of particle size to 0.2-2mm
	Pyrolysis	Intense heating above 300°C, followed by cooling and condensation	Rapid decomposition of cellulose to H_2, CO and char Leaching of char to obtain fermentable sugar
	Microwave pretreatment	High heating in a microwave oven	Inefficient separation of hemicellulose and lignin from cellulose Energy consuming and expensive for industrial applications
	Electron-beam irradiation	Continuous change of magnetic field	
Chemical	Alkaline hydrolysis	Dilute NaOH or $Ca(OH)_2$, aided with H_2O_2 60°C for NaOH, 120°C for $Ca(OH)_2$	Sequestration of lignin and hemicellulose into alkali-soluble fraction Reduction of cellulose crystallinity Lower reactor cost than in acid hydrolysis
	Acid hydrolysis with diluted inorganic acids	0.75–5% H_2SO_4, HCl, or HNO_3 120–200°C 1 MPa 2–10min	Lignin is not hydrolyzed pH neutralization is necessary High production of toxic inhibitors
	Acid hydrolysis with concentrated inorganic acids	10-30% H_2SO_4 170–190°C	Equipment corrosion Acid recovery is necessary Environmentally challenging High production of toxic inhibitors
	Organosolv	Organic solvents mixed with water, inorganic salts and inorganic acids >120°C, 20-60min	Removal of lignin and hemicellulose Environmentally challenging
	Ionic liquids	/	Efficient solubilization and removal of lignin Low hemicellulose and cellulose loss High price of ionic liquids
Physicochemical methods	Liquid hot water	170–230°C >5MPa 1-45min	Cellulose depolymerization Partial lignin solubilization High xylose recovery No toxic inhibitors
	Steam explosion (autohydrolysis)	160–300°C 0.69–4.85MPa Several seconds to minutes	High solid loads Formation of inhibitors Lignin is not solubilized High degree of hemicellulose hydrolysis
	Ammonia fiber explosion	1–2kg ammonia/kg dry biomass 90°C 1.12–1.36MPa 30min	Ammonia recovery is required No inhibitors Partial lignin solubilization
Biological methods	Enzymatic delignification	Enzymatic cocktail of laccase, lignin peroxidase and manganese peroxidases from white rot fungi	No inhibitors formed Mild reaction conditions Environmental friendly Long pretreatment time

Source: (Dey et al., 2020; Robak & Balcerek, 2020)

Mechanical comminution, alkaline hydrolysis, steam explosion and liquid hot water method are the most common physical, chemical, or physicochemical methods of lignocellulose biomass pretreatment,

Dr. Ashok Rathoure (asokumr@gmail.com)

respectively. The most significant limitation of all pretreatment methods, except biological, is formation of toxic inhibitory byproducts: phenolic compounds, furfural, 5-hydroxymethylfurfural, formic, acetic and levulinic acid. These compounds interfere with microbial growth, inhibit yeast alcohol dehydrogenase, induce cell membrane damage and chromatin destruction, compromising fermentation productivity and bioethanol yield. Hence, it is of utmost importance to detoxify the substrate mixture prior to hydrolysis by membrane filtration, absorption on activated charcoal, solvent extraction or ion-exchange (Dey et al., 2020; Robak & Balcerek, 2020).

Hydrolysis of Polysaccharides

Hydrolysis of cellulose and hemicellulose is otherwise known as saccharification, indicating depolymerization and hydrolysis of polysaccharides into a mixture of corresponding monosaccharides (fermentable sugar). Hydrolysis can be chemical and enzymatic. In chemical hydrolysis polysaccharide mixture is treated with inorganic acids. Diluted acid hydrolysis facilitates step-by-step separation of hemicellulose and cellulose monomers, whereas hydrolysis with concentrated acids mainly yields hemicellulose monomers. Acid hydrolysis is characterized by high saccharification yield (70-100%, depending on the acid concentration). However, environmental concerns, equipment corrosion and glucose decomposition are significant limitations of this method (Dey et al., 2020).

Enzymatic hydrolysis provides selective conversion of lignocellulose polysaccharides in mild reaction conditions with a saccharification yield of 75–85%. Depending on the pretreatment technique, cellulases or mixtures of cellulases and hemicellulase are necessary for complete hydrolysis. Hemicellulases are complex enzyme cocktails that hydrolyze hemicellulose to a mixture of pentoses (xylose, arabinose) and hexoses (galactose, glucose, mannose). Commercial development of hemicellulases is not as advanced as for cellulases, since the predominant substrate for enzymatic hydrolysis is the biomass pretreated with diluted inorganic acids, where hemicellulose is removed before saccharification (Mohanram et al., 2013). Large-scale enzymatic saccharification of lignocellulose polysaccharides is most commonly performed in fed-batch bioreactor, which relies on sequential time-dependent addition of substrates for complete hydrolysis in each step. Most common disadvantages of this method are batch-to-batch oscillations, frequent startup and shutdown problems, high cost of labor and problem of enzyme recovery (Dey et al., 2020).

Thermostable cellulases are ideal biocatalysts for cellulose bioprocessing, because higher temperatures increase the reaction rate, diffusion coefficient, bioavailability and solubility of the substrate, while decreasing viscosity and minimizing the risk of microbial contamination (Srivastava et al., 2015; Trbojević Ivić et al., 2016). Thus far, *Thermoascus aurantiacus*, *Humicola grisea* var *thermoidea*, *Chaetomium thermophilum*, *Geobacillus* sp. HTA426, *Sporotrichum thermophile*, *Thermomonospora curvata*, *Scytalidium thermophilum*, *Clostridium staminisolvens* and *Pyrococcus furiosus* were reported as producers of thermostable cellulases (Ejaz et al., 2021).

Fermentation of Monosaccharides to Bioethanol

Industrial bioethanol fermentation is usually performed with *S. cerevisiae* and bacteria *Zymomonas mobilis* (Robak & Balcerek, 2020). Significant disadvantage of *S. cerevisiae* is its inability to ferment pentoses, therefore, for efficient fermentation of mixed pentose and hexose substrate, a microbial co-culture would

Dr. Ashok Rathoure (asokumr@gmail.com)

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

be preferred (Lamichhane et al., 2021; Verma & Kumar, 2021). Also, with the upgrade of fermentation techniques implementation of thermostable microorganisms can result in better bioethanol yield.

The typical method of bioethanol production in batch fermentation is the Melle-Boinot process. It consists in broth preparation (pH adjustment, 14–22% by mass) and sterilization, followed by yeast fermentation. Fermented broth is centrifuged and bioethanol is separated from supernatant, while the yeast biomass is recycled for the next fermentation. The process can be repeated until the activity and viability of yeast cells is lost after which fresh inoculum is added (Bušić et al., 2018). From this basic set-up, several upgraded technologies emerged, summarized in Table 3.

Table 3. Advancement in bioethanol fermentation techniques

Fermentation Method	Characteristic	Remark
Separate hydrolysis and fermentation	Independent enzymatic hydrolysis and fermentation	Each stage is performed under its optimal conditions Enzyme hydrolysis is unaffected by bioethanol inhibition Surfactants must be added to reduce β-glucosidase inhibition by glucose High cost of separate bioreactor system
Simultaneous saccharification and fermentation	Simultaneous enzymatic hydrolysis and fermentation	Lower production cost Reduced enzyme inhibition by simultaneous end product removal Lower requirement for sterile conditions (bioethanol is produced immediately with glucose conversion) Thermotolerant microbes must be used
Simultaneous saccharification and fermentation with short pre-saccharification	Pre-hydrolysis at 50°C, followed by fermentation	Reduced viscosity of fermentation substrate Higher productivity of fermentation
Simultaneous saccharification and co-fermentation	Simultaneous saccharification and fermentation of pentose/hexose mixture	High bioethanol yield Pentoses and hexoses can be fermented Recombinant thermotolerant microbes, capable of fermenting both monosaccharides are necessary
Consolidated bioprocessing	One-pot production of hydrolytic enzymes, hydrolysis of pretreated biomass and fermentation of all types of soluble sugars	Cost-effective More efficient hydrolysis Reduced risk of microbial contamination Specialized microbes must be used (recombinant *E. coli* or *Fusarium oxysporum*)

Source: (Dadwal et al., 2020; Dey et al., 2020; Hoffman et al., 2021; Lamichhane et al., 2021; Liu et al., 2016).

After fermentation bioethanol is extracted from fermentation broth and purified. Distillation is the conventional method for separation and partial purification of bioethanol from aqueous fermentation broth, based on the difference of the boiling points of bioethanol and water (78.3°C and 100°C, respectively). Continuous distillation column system is conventionally used in large-scale processes (Robak & Balcerek, 2020). Lately, membrane technology has been employed in bioethanol recovery. Pervaporation was used to purify bioethanol from bioethanol-water mixture, but also from more complex lignocellulose broth (Abels et al., 2013; Gaykawad et al., 2013). Membrane extraction of bioethanol from fermentation broth

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

was performed with around 80% of the product recovery (Chang et al., 1992). High purity bioethanol (99.7% v/v) is obtained only by dehydration (Robak & Balcerek, 2018).

Factors Influencing Bioethanol Yield

Composition of lignocellulose biomass, enzyme and substrate loading and mixing are the major factors to consider in the hydrolysis step. Lignin and hemicellulose are the main contributors to biomass resistance to hydrolysis, therefore better results could be achieved by the careful selection of raw material with lower percentage of lignin and hemicellulose, such as rice husk, saw dust or pinewood (Preethi et al., 2021). Higher enzyme and solid loadings favor higher saccharification yield. However, high solid loading can also increase viscosity, heat and mass transfer limitations and inhibition by toxic components during fermentation (Dey et al., 2020; Robak & Balcerek, 2020). Inappropriate mixing will negatively affect saccharification yield, either due to insufficient aeration when the mixing is poor, either due to enzyme denaturation by the shearing force. Non-ionic surfactant Tween 80, non-catalytic protein bovine serum albumin or polyethylene glycol prevent non-productive adsorption of cellulase to lignin, with no effect on enzyme catalytic activity and are common additives during hydrolysis and fermentation (Robak & Balcerek, 2020).

Fermentation requires more complex regulation, since it must provide optimum conditions for growth of microbial cell mass and utilization of fermentable sugars. Temperature and pH range of industrial fermentation are adapted to *S. cerevisiae* and have to be optimized for any other microorganism. Higher glucan loading exhibits positive dose-dependence to the bioethanol yield. However, high sugar concentrations induce osmotic pressure on yeast and plasmolysis. Steering speed and reaction time are inversely proportional variables: at higher agitation speed fermentation will be completed in shorter reaction time. Too intense agitation can cause microbial cell disruption. At a low biomass density (optical density at 600 nm=1) the yeast cell viability is compromised by the substrate's inhibitory effect, while at the excessively high biomass density (optical density at 600 nm=8) yeasts consume more glucose, which is converted into the microbial biomass instead of bioethanol (Robak & Balcerek, 2020). Bacterial contamination during fermentation is a common cause of low bioethanol yield. Antibiotics are traditionally used to control contamination; however, they can be detected in the final product. Alternatively, microbial contamination can be prevented by using antimicrobial natural products, lysozyme and bacteriophages and by the proper selection of fermentation method (*i. e.* simultaneous saccharification and fermentation, Table 3) (Lamichhane et al., 2021; Verma & Kumar, 2021).

Techno-economic Analysis

Bioethanol market is segmented by feedstock type, application, and geography. In 2020 approximately 100 billion liters of bioethanol were produced globally, with projected compound annual growth rate (CAGR) >4.5% between 2021 and 2026 (Mordor Intelligence, 2016).

Bioethanol Market by Feedstock Type

Majority of global bioethanol production arises from food crops: maize (60% share, main producer USA), sugarcane (25% share, main producer Brazil), molasses (7% share, main producer India), cereals and sugar beet (4%, main producer the European Union) (Flach et al., 2019; Ibeto et al., 2011). Global

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

production of lignocellulose-derived second-generation bioethanol is 400 million liters per year, but is expected to increase in the future (Mizik et al., 2020). Significant step forward is the opening of processing plants for production of bioethanol from bagasse, rice straw, wood chips, corn stover and straw in Finland, Italy, Australia and Serbia, respectively (Dey et al., 2020; Martinov et al., 2015).

The price of feedstock represents 40-75% of the total bioethanol production costs. According to Devi, only 3% of global annual production of lignocellulose biomass accounts for all of its derivatives (bioethanol, bio-based chemicals, non-food products) (Devi et al., 2022). Paradoxically, food crops are more cost-effective feedstock than lignocellulose biomass (US$0.2 - US$0.3/L for bioethanol from sugar cane, compared to US$0.8 – US$1.2/L for bioethanol from lignocellulose material) (Bušić et al., 2018). The rationale behind this is the non-uniform composition of the lignocellulose biomass components, depending on the source. Biomass with higher lignin content requires additional costs of pretreatment for lignin removal, than biomass in which cellulose and hemicellulose are more abundant (Preethi et al., 2021; Verma & Kumar, 2021).

Bioethanol Market by Application

Approximately 80% of globally produced bioethanol is used as transportation fuel, followed by the food, pharmaceutical, and cosmetics sector (Mizik et al., 2020). As a transportation fuel, bioethanol is mixed with gasoline at volume fractions 5, 10 or 85% of bioethanol (fuel codes E5-85). Only E5 and E10 can be directly used in the existing motors without modifications, hence they represent the largest share in the market (Bušić et al., 2018). Recently, efforts are also being made to implement bioethanol as bio-jet fuel in aviation transport (Han et al., 2019).

Bioethanol Market by Geography

The leading global producers of bioethanol are USA, Brazil, the European Union, China, India and Canada (Bušić et al., 2018; Mordor Intelligence, 2016). In Europe, Sweden, Germany, the United Kingdom, France and Italy have primacy in bioethanol production. Collectively, European countries produce annually more than 2 billion liters of bioethanol, while in the USA production capacity is 66 billion liters bioethanol/year (Robak & Balcerek, 2018). The USA and Brazil are the leading global consumers of bioethanol, whereas the top three European bioethanol consumers are Germany, the United Kingdom and France (Flach et al., 2019). The Asia-Pacific region is considered to be the fastest-growing market, with China and Japan as regional leaders.

Impact of COVID-19 on Global Bioethanol Market

The COVID-19 pandemic has affected the bioethanol economy dramatically. From April-June 2020 global consumption and bioethanol price decreased by 40%, or US$3.4 billion (Renewable Fuels Association, 2021). The USA was most seriously affected, with US$2.9 billion losses in the bioethanol sector. Pandemics had no measurable impact on the European bioethanol market (Mizik et al., 2020). This interesting observation can be explained by the regional differences in feedstock for bioethanol production: USA relies predominantly on corn, while in Europe cereals and sugar beet are the dominant raw material. Reduction in biofuels demand has also sharply increased market prices of bioethanol value-added by-products as a result of a cutback in supplies (Renewable Fuels Association, 2021). The negative effect

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

of the pandemics is even more pronounced in the middle-income countries where agriculture is a more significant contributor to the GDP, however the long-term effect of the pandemic will be comprehended only after the COVID-19 crisis passes (Shruthi & Ramani, 2021).

Co-relation of Global Cellulase Market and Global Bioethanol Market

It is estimated that the global biofuel enzymes market will reach US$2.0 billion by 2026. Cellulase market follows the similar pattern as bioethanol market. Around 40–49% of the total cost of bioethanol production is attributed to cellulase. Novozymes and Genecor, market leaders in the production of industrial enzymes, have contributed to the significant decrease in price of industrial cellulases (Srivastava et al., 2015). Nevertheless, to improve bioethanol production economy, further decrease of the price is necessary to the projected value of US$0.026/L (Acharya & Chaudhary, 2012). Cost-reduction can also be achieved by the careful choice of the fermentation method. By switching from separate to simultaneous saccharification and fermentation (Table 3) costs could be reduced from US$1.2/L to US$0.6/L (Dey et al., 2020).

SOLUTIONS AND RECOMMENDATIONS

Solutions and perspectives for the issues presented in the previous section will be considered in this section from the following aspects:

- Increasing the economic value of lignocellulose biomass
- Tailoring of cellulases for efficient production of bioethanol.

Increasing the Economic Value of Lignocellulose Biomass

As discussed previously, the price of lignocellulose raw material contributes most significantly to the overall price of bioethanol. These expenses can be compensated by production of other valuable by-products. Accordingly, subject of great attention in recent decades is design and development of biorefineries for integrated production of bioethanol and other valuable products from cellulose, hemicellulose and lignin, as a base of circular bioeconomy. Other than bioethanol, cellulose is a source of sorbitol, levulinic and succinic acid, additives in food and pharmaceutical industry. Lactic acid, xylitol, xylo-oligosaccharides, furfural, hydroxymethylfurfural and polyhydroxyalkanoates, obtained from hemicellulose, are used in pharmaceutical, chemical and food industry. Furfural and hydroxymethylfurfural are precursors of pesticides and fertilizers. As mentioned previously in this chapter, these two compounds are inhibitors of cellulose hydrolysis. Therefore, their sequestration represents a double gain. Lignin can be used directly as fuel to boilers for pulp production, but it is even more important as a source of lignol and vanillyl alcohol (Devi et al., 2022). Vanillyl alcohol exhibits antioxidant and antimicrobial activity, but also can be used as a flavoring agent in food and cosmetic industry. In a recent study it was used for synthesis of capsinoids, small molecules with wide array of physiological activity (Trbojević-Ivić et al., 2017).

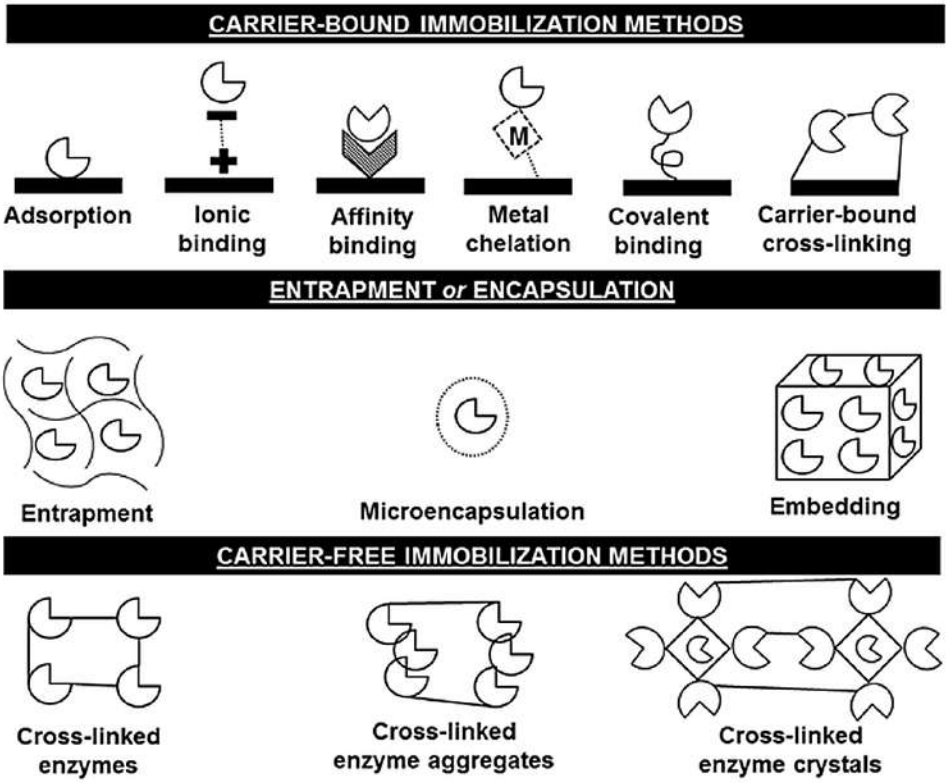
Tailoring of Cellulases for Efficient Production of Bioethanol

Biorefinery process requires biocatalysts with high catalytic efficiency on insoluble substrate, stable at higher temperature and pH, and resistant to end-product inhibition (Mohanram et al., 2013). This section will highlight how these requirements can be met by enzyme immobilization.

Fundamental Aspects of Enzyme Immobilization

Enzyme immobilization is sequestration of enzymes in a limited, well-defined space with preservation of its catalytic activity. This is unique technique of biocatalyst tailoring that combines simultaneous stabilization, reusability and easy separation of the enzyme from the reaction mixture. Additionally, multiple enzymes with different catalytic activities can be simultaneously immobilized into unique biocatalyst machinery for one-pot biotransformation. An overview of enzyme immobilization methods is represented at Figure 4.

Figure 4. Techniques of enzyme immobilization
Source: (Datta et al., 2013; Sheldon, 2007)



Carrier-bound techniques and entrapment have the most practical significance. In physical adsorption, ionic and affinity binding and metal chelation enzymes are reversibly bound to the carrier *via* weak non-

covalent bonds. Enzyme immobilization carriers can be of different origin, chemical structure, particle morphology and size. Natural immobilization carriers, polysaccharides and proteins, are biocompatible and non-toxic, which is relevant for medical applications, pharmaceutical or food industry (Trbojević-Ivić et al., 2018). Eupergit-C, Sepabeads-EC, Amberlit and Purolite A109 are frequently used synthetic polymers for enzyme immobilization (Mihailović et al., 2016; Milosavić et al., 2012; Trbojević-Ivić et al., 2018; Žuža et al., 2009). Among inorganic materials, silica-gel, metal oxides and ceramics are most common. Recently, immobilization of lipase from *Candida rugosa* on hydroxyapatite *via* metal chelation resulted in an improved biocatalyst with interesting novel applications (Trbojević-Ivić et al., 2017; Trbojevic Ivic et al., 2016). Entrapment is an irreversible immobilization method, in which an enzyme is confined inside the carrier matrix but the two entities do not interact chemically. Alginate gels are the most popular matrixes for entrapment (Dimitrijević et al., 2011). In microencapsulation concentrated enzyme solution is confined in micelles or reverse micelles, which enables better catalytic efficiency (Trbojević-Ivić et al., 2018).

Immobilization efficiency is governed by the immobilization method (Figure 4) and immobilization carrier characteristics. In covalent immobilization, enzymes are irreversibly chemically attached to the carrier so enzyme leakage is minimized. However, problems arise if enzymes are bound *via* an active site. Physical adsorption is a popular technique, because high immobilization yield is achieved in a short time. However, a significant limitation of this method is enzyme leakage. In encapsulation and entrapment enzyme leakage is minimum, however these methods are unsuitable for enzymes processing polymeric substrates, such as cellulases.

Nanomaterials in Enzyme Immobilization

Nanomaterials are next generation of immobilization carriers with high surface area, distinctive morphology, architecture and porosity (Altinkaynak et al., 2016). Enzyme is bound covalently or non-covalently to silica-based, polymer-based, metal-based or carbon-based nanomaterials, forming nanobiocatalyst system. Magnetic nanoparticles are most common in practice. They consist of magnetic core (iron, nickel, cobalt), which enables easy separation in magnetic field, while chemical coating provides functional groups for enzyme immobilization and additional functionalization. Polymer-based nanomaterials can be easily produced at high quantities and have plethora of functional groups for immobilization and modification. However, their mechanical stability is low. Carbon-based nanomaterials are suitable for physical adsorption, but can also be used for covalent immobilization after additional functionalization (Misson et al., 2015).

Cellulase Nanobiocatalyst Systems

Nanomaterials have become an essential tool in tailoring cellulase activity for production of bioethanol. Strategies to immobilize particular cellulase or mixture of several cellulolytic enzymes are described in the literature (Husain, 2017; Perwez et al., 2017; Zanuso et al., 2022). Among individual cellulases, the most common are those from *T. reesei*, *A. niger*, *A. fumigates*, *A. nidulans* or *T. viride* and commercial cellulases Cellusoft CR, Cellic CTec2 (Husain, 2017; Jabasingh, 2011; Lupoi & Smith, 2011; Simon et al., 2018). In multi-enzyme preparations, endoglucanase is co-immobilized with β-glucosidase, cellobiohydrolase and xylanase, while β-glucosidase can also be co-immobilized with glucose oxidase or cellobiohydrolase. Silica-based, magnetic and metal-oxide nanoparticles are the most common carri-

ers for immobilization of cellulases. Functionalization of these materials with polymers, polyalcohols, glutaraldehyde, carboxyl and amino groups enables efficient covalent binding or physical adsorption. Nanomaterials with small pores and encapsulation are unsuitable for cellulase immobilization, due to significant diffusional limitations of bulk substrate, such as pretreated biomass (Husain, 2017).

Efficiency of the applied immobilization protocol is determined through immobilization yield, temperature and pH stability and optima and reusability. In most cases, regardless of the method and support choice, immobilization yield was between 60–95% (Husain, 2017; Jabasingh, 2011; Manasa et al., 2017; Sillu & Agnihotri, 2020; Simon et al., 2018). Immobilization commonly resulted in the shift of the optimum pH and temperature to higher values and improved temperature stability (Lupoi & Smith, 2011; Manasa et al., 2017; Sillu & Agnihotri, 2020). The most prominent feature of immobilized cellulase is reusability: immobilizate could be used in more than ten consecutive cycles of carboxymethyl cellulose hydrolysis without significant loss of activity (Husain, 2017; Jabasingh, 2011; Lupoi & Smith, 2011; Manasa et al., 2017; Zanuso et al., 2022). Storage stability of cellulase was also significantly improved at 4^{o}C upon immobilization (Simon et al., 2018; Zanuso et al., 2022).

Industrial potential of immobilized cellulase was assessed by hydrolysis of lignocellulose biomass after different pretreatments. *T. reesei* cellulase covalently immobilized on zinc ferrite nanoparticles effectively hydrolyzed sonified and alkali-pretreated sun hemp biomass, with hydrolysis yield of 53% (Manasa et al., 2017). Cellic CTec2 cocktail, immobilized on chitosan-coated magnetic nanoparticles, hydrolyzed hydrothermally pretreated corn cob with hydrolysis yield of 65% (Zanuso et al., 2022). Cellulase-halloysite-metal-oxide nanobiocomposites hydrolyzed bagasse extracted with ionic liquids with 50.2% hydrolysis yield (Sillu & Agnihotri, 2020), while cellulase from *T. viride*, physically adsorbed on silica nanoparticles, was successfully implemented in simulation of simultaneous saccharification and fermentation of bioethanol from microcrystalline cellulose (Lupoi & Smith, 2011).

FUTURE RESEARCH DIRECTIONS

Bioethanol is technologically, economically and environmentally viable alternative to fossil fuels. However, major issue is the production of bioethanol at a competitive price. Efficient selection and pretreatment of raw material, together with circular bioeconomy concept will reduce the total cost of lignocellulose bioethanol production by co-generating other valuable products. However, a good biorefinery is the one that leaves minimum or no waste during a process. Therefore, zero-waste biorefinery needs the skills and proficiency from different interdisciplinary fields such as chemistry, biochemistry, chemical engineering, biology, biomolecular engineering and materials sciences. Genetic modification of microbial producers of cellulase and biocatalyst tailoring are aimed at reducing biocatalyst price by increasing its catalytic efficiency and stability for industrial reaction conditions. Immobilization provides an endless field of possibilities to improve cost-effectiveness of cellulases in bioconversion of lignocellulose biomass to second-generation bioethanol. Plethora of well-established immobilization protocols, innovative immobilization carriers and development of nanotechnology will lead to design of reusable nanobiocatalysts of high stability and activity for large-scale processes. It is believed that these solutions combined will significantly contribute to price competitiveness of bioethanol on the global fuel market.

CONCLUSION

Modern society must find a long-lasting solution to depletion and environmental concerns caused by extensive use of fossil fuels. Lignocellulose biomass is the most abundant raw material in the biosphere, giving rise to second-generation bioethanol, the most promising alternative to fossil fuels. Bioconversion of lignocellulose to bioethanol is a complex process of selection and pretreatment of biomass, hydrolysis of cellulose, fermentation and purification of bioethanol. Hydrolysis of cellulose is the key phase of the process and is governed by synergistic activity of cellulase multi-enzyme complex. Mesophilic and thermophilic fungi and bacteria are the main industrial producers of cellulases. Price of raw material and cellulase affect the overall cost of bioethanol production from lignocellulose biomass and need to be reduced to make bioethanol more concurrent on the global fuel market. Reducing cellulase price is considered crucial to increase bioethanol market competitiveness. Important feature, which contributes to cost-effectiveness is biocatalyst recycling or reusability. This can be achieved only by enzyme immobilization. Immobilization of enzymes is a well-known and well-established strategy with a myriad of elaborate protocols and immobilization methods available to choose from. By proper selection of the method and carrier a superior catalyst can be designed with high stability and activity, which can be reused many times without significant activity loss and can be easily separated from the product. Recently, nanomaterials are considered as innovative immobilization carriers with unique characteristics and a whole new field of research and application of nanobiocatalysts has emerged. Silica, magnetic and metal-oxide nanoparticles are the most common carriers for cellulase covalent and non-covalent immobilization. Upon immobilization, temperature stability and reusability of cellulases were significantly improved, which resulted in successful pilot-scale implementation of immobilized cellulases in hydrolysis of biomass with glucose yield above 50%. Issues addressed in this chapter can provide a good starting point to research and applied sectors in devising a production strategy for more efficient and cost-effective production of cellulosic biofuels.

KEY TERMS AND DEFINITIONS

Cellulase: A multi-enzyme complex, consisting of endoglucanase, exoglucanase, and β-glucosidase, which act synergistically for efficient hydrolysis of cellulose to glucose.

Enzyme: A protein of unique structure, which accelerates chemical reactions in biological systems with high substrate specificity. Also referred to as biocatalyst.

Enzyme Immobilization: Confinement of enzyme in a limited, well-defined space, with preserved catalytic activity, resulting in enzyme stabilization, activation, and easy continuous use.

Enzyme Reusability: Continuous use of enzyme in more than one reaction cycle without significant loss in activity. The most significant parameter of efficiency of the enzyme immobilization method.

Fermentable Sugar: Mixture of monosaccharides, obtained after hydrolysis of carbohydrate polymers in lignocellulose biomass. They are converted to bioethanol by metabolic machinery of specialized microorganisms in well-defined, tightly controlled conditions.

Lignocellulose Biomass: A complex material, composed of lignin, cellulose, and hemicellulose, which strengthens and protects plant cells from pathogens and mechanical damage. The most abundant and renewable raw material for production of bioethanol.

ABSTRACT

Sustainable development is a key aspect of modern-day development. Reducing fuel cost and emissions is considered as the most important research area in sustainable development. Biodiesel has the potential to reduce the requirement of petroleum diesel if blended in suitable proportion. Various feedstocks are being explored for biodiesel production. Oils derived from neem and jatropha can be utilized for biodiesel production. In the current investigation, optimum parameters for the production, namely catalyst proportion, temperature, and oil-to-alcohol ratio were optimized. Experiments were carried out at different blend proportions to study fuel properties, namely kinematic viscosity, aniline point, diesel index, flash and fire points, specific and API gravity, cetane number, and ASTM distillation characteristics.

INTRODUCTION

Sustainable development is key aspect of modern-day development. Reducing fuel cost and emissions is considered as the most important research area in sustainable development. Most commonly fuels used across the world for vehicles, railways, boilers and majority of industrial applications are derived from fossil fuel. These fossil fuels are non-renewable. Alternative fuel sources are being explored such as wind and solar energy, hydrogen fuel, tidal energy and biodiesel from renewable feedstocks like

vegetable oil, cellulose, fats and chitosan. Viability of biodiesel synthesis depends on raw material and biodiesel properties. Waste food, vegetables, nonedible crops are suitable raw materials for biodiesel synthesis. Advantages of biodiesel include reduced toxicity, improved emission, rapid degradation and high flash point (Romano and Sorichetti, 2011). Predojevic et al. utilized Linoleic and oleic sunflower oils for biodiesel by (Predojevic et al.,2012). They used calcium oxide as solid base catalyst (Predojevic et al.,2012). Low-cost feed stocks are important for economic viability of biodiesel synthesis. Waste minimization through energy synthesis can serve the sustainable development goal (Ray et al., 2013; Stephane Bungener, 2016). Selection of appropriate catalyst is also very crucial aspect. Use of strong basic catalyst such as zeolite is being explored as promising method for transesterification (Ejikeme et al., 2010). Sodium methoxide and sodium hydroxide found to have good catalytic properties(Foon et al., 2004). Use of waste cooking oil for biodiesel can serve twin purpose, one of disposal and other of the raw material (Raqeeb and Bhargavi, 2015).

The fatty acid alkyl esters have characteristics very similar to diesel derived from fossil fuel (European Tech. and Innovation Platform, 2022). Acid or base catalysts can be used for the transesterification (Patel and Shah, 2015). The functional group of the catalyst attacks the carbonyl carbon. Catalytic and non-catalytic pathways are available for transesterification (Patel and Shah, 2015). Transesterification temperature depends on the raw material (Mekala et al., 2014). High temperature favors reaction but need to be controlled to avoid denaturation.

Neem is a tree in a mahogany family found in abundance in India (Elkadi et al., 2013). It has pesticidal and insecticidal application. Neem seeds find application in remedial therapy. Neem oil is extracted from the fruits and seeds of the neem. This neem oil is being explored for its use as a feedstock for synthesis as the alkyl ester by transesterification process. The composition of the oil depends on processing method. The neem oil yield that can be obtained from neem seed kernels varies widely from 25% to 45% (Anya et al.,2013; Sathya and Manivannan, 2013). Jatropha grows widespread in world in the tropical and subtropical areas. Jatropha oil finds applications in soapmaking. *Jatropha curcas* oil plays important role in cosmetic industry (Pandey et al., 2012). For transesterification, homogeneous catalysts such as NaOH, KOH can be employed (De Oliveira et al., 2009; Wang et al., 2006, Berchaman et al., 2010). The two-step method with an acid and basic-catalysed reactions can be used to produce biodiesel from oil containing high amount of free fatty acid (FFA) such as Jatropha oil (Choudhury, 2013; Ngo et al., 2008). Before the investigations, parameters for the production, namely catalyst proportion, temperature, oil to alcohol ratio were optimized. Experiments were carried out at these optimized parameters with different blend proportions to study fuel properties namely kinematic viscosity, aniline point, diesel index, flash and fire points, specific and API gravity, cetane number and ASTM distillation characteristics.

METHODOLOGY

Oil Extraction

Neem Oil

Transesterification by alkali catalyst is one of the most effective methods (Ibrahim et al., 2021.; Ramasubramanian *et al.,* 2017). Hexane was used as solvent and Soxhlet apparatus was used for extraction. 200 ml of hexane and neem powder (70 gm thimble) was taken in Whitman paper. Round bottom flask

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

and condenser were installed in Soxhlet apparatus. The solvent was heated to maintain the temperature of 65-70 ^{0}C. As the liquid boils, the vapors are condensed. The condensate of n-hexane falls down and wets the thimble. n-hexane extracts the neem oil. The mixture n-hexane and oil is collected in the same round bottom flask. Four cycles were repeated for extracting more neem oil. The oil was separated from the solvent by using distillation. This oil was used for the transesterification process. Oil was heated in a three neck round bottom flask to 110þC for removal of water and then cooled. 0.5 gm of KOH and 300 gm of methanol were added to the oil. The mixture was stirred to blend with KOH. The oil was warmed to 60þC & mixed with potassium methoxide. The reaction was carried out for 5 hours at temperature 67þC. The resultant mixture changed to light green shade. The fishy scent indicated formation of ester and glycerol layers. Traces of glycerol, unreacted methanol and impurities were removed by adding 200 ml of warm water. Finally, a clear light biodiesel was obtained. Neem oil biodiesel blends with diesel were prepared. The blends were analyzed for specific gravity, density, kinematic viscosity, aniline point, pour point, flash point and cetane number.

Jatropha Oil

Pellets of potassium hydroxide were taken in a measuring cylinder and methanol was added in required proportion. Proper blending of oil with the methanol was ensured by shaking, warming and stirring. Blending and warming was continued for 2 hrs at temperature of 64 ^{0}C. The mixture changes to a turbid orange tan color in 5-10 minutes. Then it changed to a reasonably transparent dark shade. Sweet smell indicated the finishing stage. Blending and warming was continued for another 60 minutes. Two distinct phases are formed once blending and warming is halted. In the ester phase, likely impurities are glycerol, unreacted methanol and traces of soap. These impurities are removed by adding 100 ml of warm water to the ester. Then it was passed through the calcium hydroxide pellet for removing moisture content properly. The other phase was glycerol as a byproduct. The jatropha ester was blended with petroleum diesel fuel in several proportions and the analysis was carried out. The blends were analyzed for acid value, specific gravity, density, kinematic viscosity, aniline point, pour point, flash point and cetane number.

As indicated in table 1, optimum parameters obtained from optimization experiments were used to carry out experiments for studying properties of oil derived biodiesels and their different blends.

Table 1. Optimum parameters

Parameter/Factor	Parameter Value
Neem oil	
process temperature	67^{o}C
Catalyst concentration	0.5 gm
Oil: methanol ratio	1:6.5
Jatropha oil	
process temperature	64^{o}C
Catalyst concentration	0.35 gm
Oil: methanol ratio	1:5.5

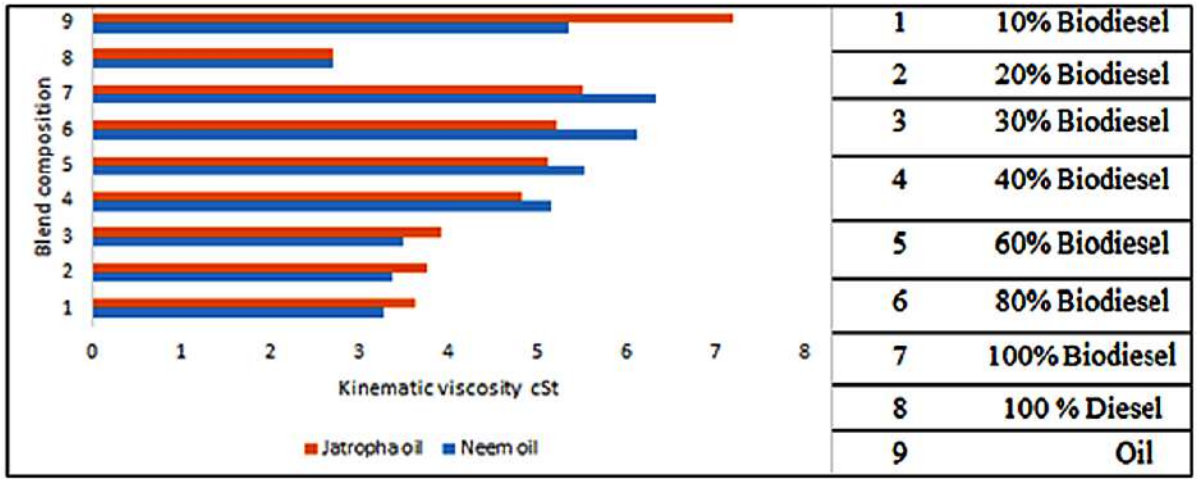
RESULTS AND DISCUSSION

Calorific values for neem oil biodiesel and jatropha oil biodiesels were 7439.91 kcal/kg and 9121.8 kcal/kg respectively. Blends of these biodiesels with petroleum diesel can be used with improved calorific values. The diesel fuel has calorific value 10800 kcal/kg. The BIS specified range is 9900-10,500 kcal/kg. Other fuel properties are discussed in following sections or biodiesels and their blends.

Kinematic Viscosity

The kinematic viscosity at 40 ^{0}C for high-speed diesel must 2.5 to 7.5 cSt (centistokes) as per the standard specification of BIS. For pure neem oil, kinematic viscosity was found to be 5.34 cSt, well within the permissible range. Pure diesel has kinematic viscosity 2.75 cSt while neem oil biodiesel, 6.32 cSt. The viscosity of 10%, 20%, 30%, 40%, 60%, 80% blends of methyl ester of pure neem with diesel are 3.28, 3.36, 3.48, 4.53, 5.15, and 6.12 cSt respectively(Figure1). Viscosity increased with increase in percentage of biodiesel in the blend. For pure biodiesel, viscosity was within the range, but high. To avoid improper ignition, lower blends (20%, 30%) having the kinematic viscosities bellow 4 cSt can be used. The kinematic viscosity of the jatropha oil methyl ester was 5.5 cSt, higher compared to diesel(2.7 cSt). The viscosities were observed to be 3.63, 3.76, 3.91, 4.81, 5.11 and 5.22cSt for 10%, 20%, 30%, 40%, 60% and 80% blends respectively (figure 1). First three blends had suitable viscosity for fuel application. It can be observed from the figure that pure biodiesel from neem oils had higher viscosity. Need oil biodiesel blends had lesser viscosity than corresponding jatropha oil biodiesel for 10, 20 and 30% biodiesel blends. For higher blends, jatropha oil biodiesel had lesser viscosity than neem oil biodiesel.

Figure 1. Kinematic viscosity for different blend compositions



Aniline Point

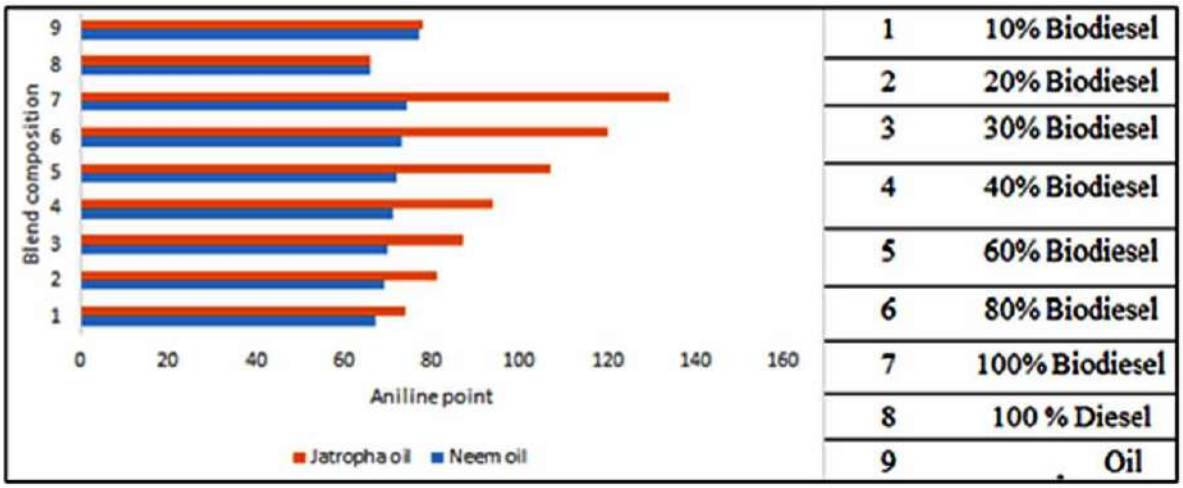
High aniline point indicates that the fuel is highly paraffinic and has high diesel index indicating good ignition quality. High speed diesel has an aniline point of 68 ^{0}C whereas 100% biodiesel has an aniline

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

point of 77 ^{0}C. Blends of neem oil methyl ester and high speed diesel have a higher aniline point when compared to high speed diesel. It can be seen from Figure 2 that the aniline point increases with biodiesel percentage in the blend. Thus the blending is advantagious as per aniline point characterization.

In case of jatropha oil derived biodiesel, 100% biodiesel had high aniline point (134 ^{0}C). The blends of jatropha methyl ester and its blends had higher aniline point compared to high speed diesel. Aniline points for various blends have been shown in figure 2. Larger the aniline point, larger the diesel index, which leads to superior quality of ignition in diesel engine. When the fuel is rich in aromatic content, it has low values of aniline point and the ignition is poor. Jatropha oil derived biodiesel is better alternative from ignition point of view.

Figure 2. Aniline point for different blend compositions



Diesel Index

The BIS specified value of diesel index is 45. The high speed diesel has a diesel index of 57.14. The diesel index of the neem oil is approximately 37.75 which is far below the prescribed limit of BIS specification. Consequently utilization of pure neem oil as a fuel will bring about an extremely poor ignition quality. A diesel index of 51.72 is obtained by using 100% methyl ester of neem oil, above the BIS specified of 45. By blending different amount of diesel and methyl ester from neem oil, diesel indices were found to decrease slightly. The diesel index for blends containing 10%, 20%, 30%, 40%, 60% and 80% biodiesel were 53.65, 57.40, 56.80, 56.50, 55.86 and 55.53 respectively, well above the specified value,45.

Pure jatropha biodiesel diesel index is approximately 81.03. For the different blends of 10%, 20%, 30%, 40%, 60% and 80% of methyl ester, the obtained diesel index values are above specified value and hence had better ignition property(figure3). Jatropha oil biodiesel was better choice than neem oil biodiesel considering diesel index.

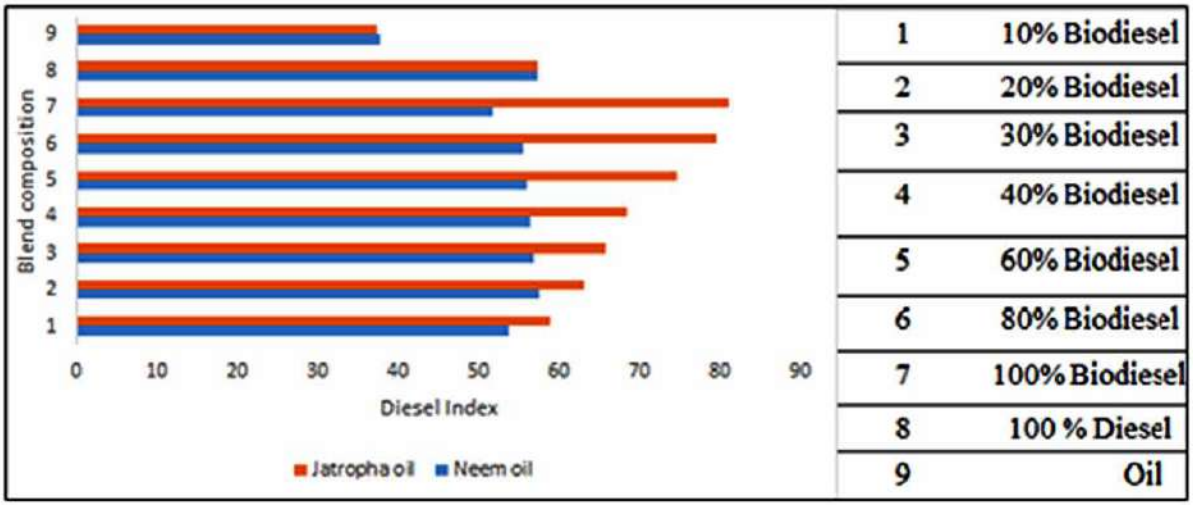
Figure 3. Diesel index for different blend compositions



Flash and Fire Point

The flash and fire points indicate possible fire hazards during transportation, handling and storage of diesel fuel. For the diesel fuel, the flash and fire points was 68 ^{0}C and 71^{0}C respectively. For 100% neem oil methyl ester, these value were 181^{0}C & 184^{0}C.As the blend percentage increases, the flash and fire point also increases. For 10, 20, 30, 40, 60 & 80%, the values of flash and fire point was obtained as 79 & 82, 89 & 92, 105 & 108, 126 & 128, 142 & 146, 162 & 165^{0}C respectively. The blending of biodiesel in petroleum diesel improves the flash point properties which is needed for better performance of fuel in terms of storage, handling and transportation.

Flash and fire points of jatropha biodiesel was 153 & 156 ^{0}C respectively. Increase in flash and fire point temperature is observed as jatropha biodiesel concentration in diesel blend increases. Flash and fire points for 10%, 20%, 30%, 40%, 60% and 80% blends were 81 ^{0}C & 84 ^{0}C, 87 ^{0}C & 89 ^{0}C, 92 ^{0}C & 95 ^{0}C, 98 ^{0}C & 101 ^{0}C, 118 ^{0}C & 120 ^{0}C, 130 ^{0}C & 133 ^{0}C respectively. The flash point study suggests that use of jatropha oil methyl ester in diesel will improve fuel efficiency. Jatropha oil biodiesel had lower flash and fire points compared to corresponding neem oil biodiesel blends. Figure 4 and 5 depicts flash and fire points for biodiesel derived from two oils.

Figure 4. Flash point for different blend compositions

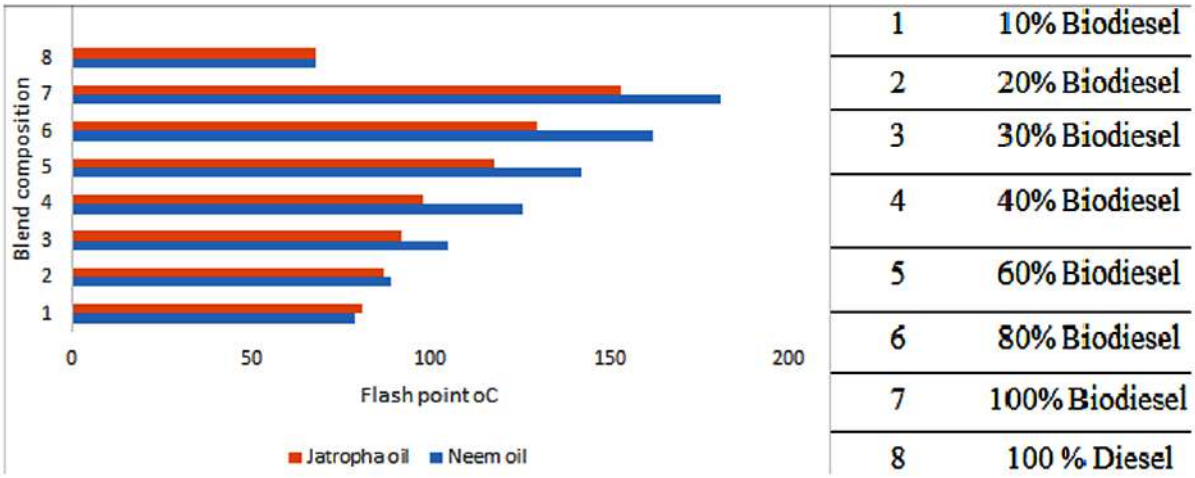

Figure 5. Fire point for different blend compositions

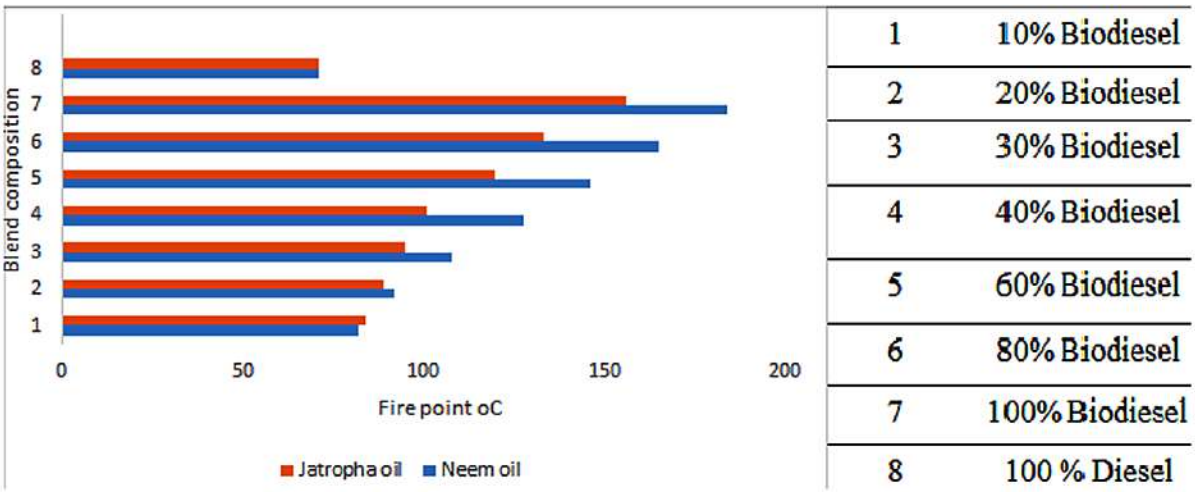

Specific and API Gravity

The specific gravity of the diesel was noted 0.835. Its value for 100% jatropha oil methyl ester was 0.89 and that for neem oil biodiesel was 0.87. The specific gravity values increased marginally with the blends proportion. Values for 10, 20, 30, 40, 60 and 80% biodiesel blend in diesel were found to be 0.838, 0.842, 0.846, 0.855, 0.862, 0.872 and 0.839,0.841,0.845,0.848,0.852,0.855 respectively for jatropha and neem oil biodiesel(figure 6 and 7). The specific gravity values are used for calculating API gravity. High specific gravity indicates high diesel index.The API gravity and aniline point values are useful for calculating diesel index by well-known relation

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Diesel Index=(0.018×Aniline point °C+0.32)×API gravity

For neem oil, The API gravity pure biodiesel was found 37.96 and 31.14.Here the reduction of API gravity with blend proportion rise were observed. Jatropha oil biodiesel was better option considering this property.

Figure 6. Specific gravity for different blend compositions

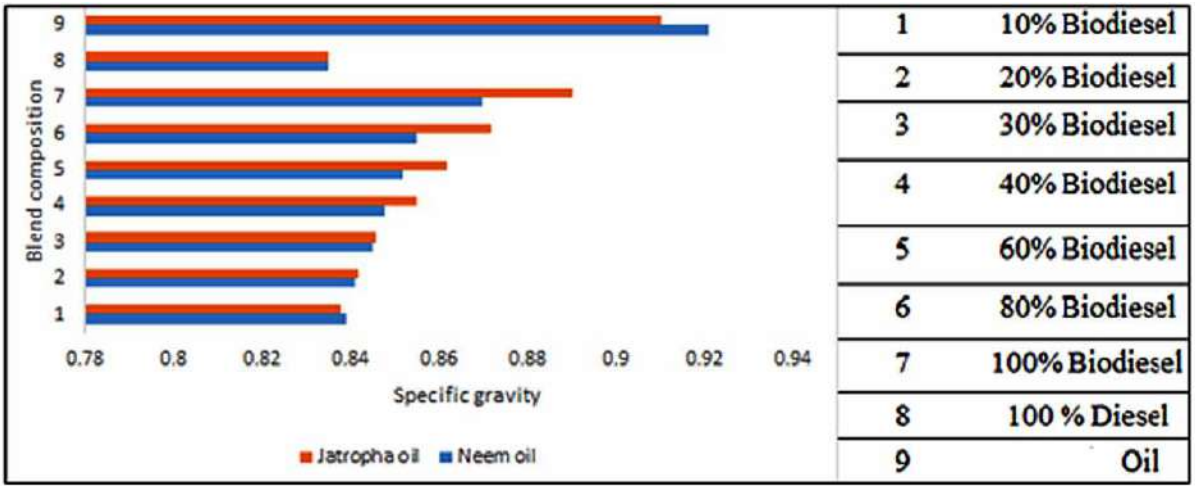

Figure 7. API gravity for different blend compositions

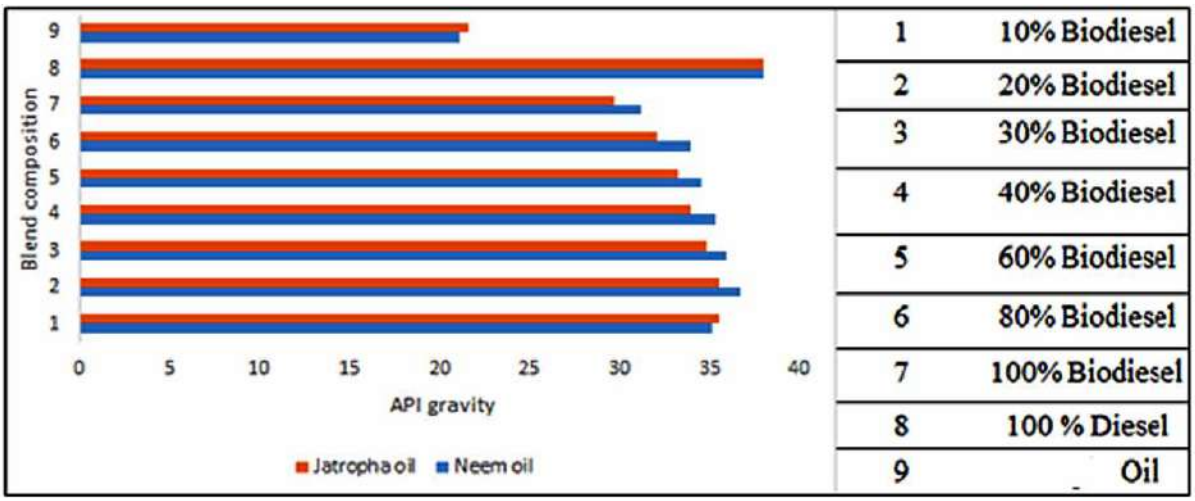
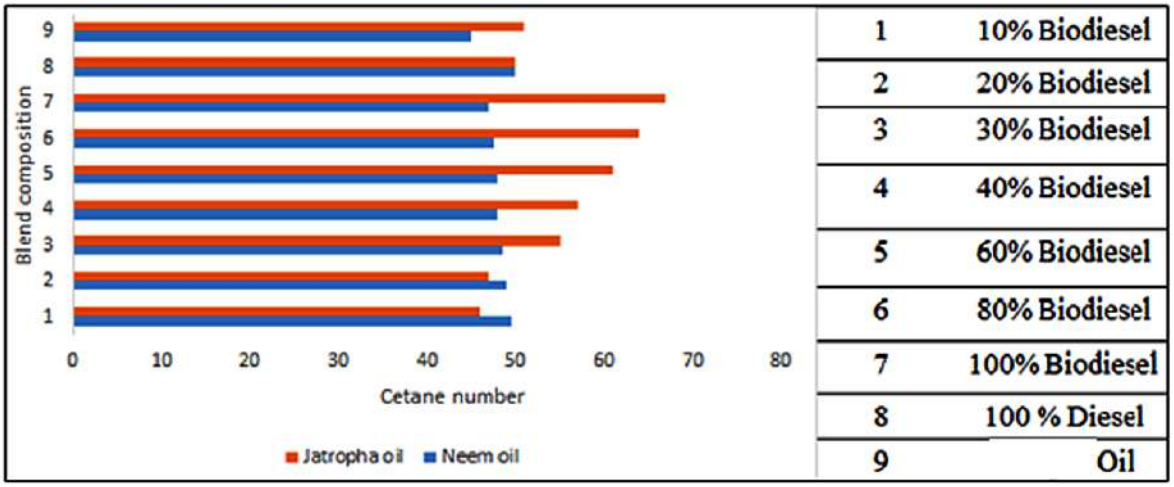


Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

Cetane Number

The Cetane number is directly proportional to diesel index. The cetane numbers for pure diesel and neem oil biodiesel were 50 and 47 respectively(figure 8). For jatropha oil biodiesel it was 67. As the blend percent increased from 10 to 80%, Cetane values decreased. Cetane numbers for neem oil biodiesel almost remained same for all blends. Cetane number for all blends was satisfactory compared to pure diesel.

Figure 8. Cetane number for different blend compositions



Initial Boiling Point

Initial boiling point(IBP) was 92 ^{0}C for 100% diesel and 125 ^{0}C for 100% biodiesel (neem oil methyl ester). It was 132^{0}C for jatropha oil biodiesel. As shown in figure 9, initial boiling point increased as the proportion of biodiesel increased. The ease of engine start-up is governed by initial boiling point for the 10% recovery in ASTM distillation. Lower IBPs are preferred for cold climates. Very low IBPs are responsible for vapor locking tendency in the diesel engine. IBPs for all the blends are in the acceptable limits for diesel fuel.

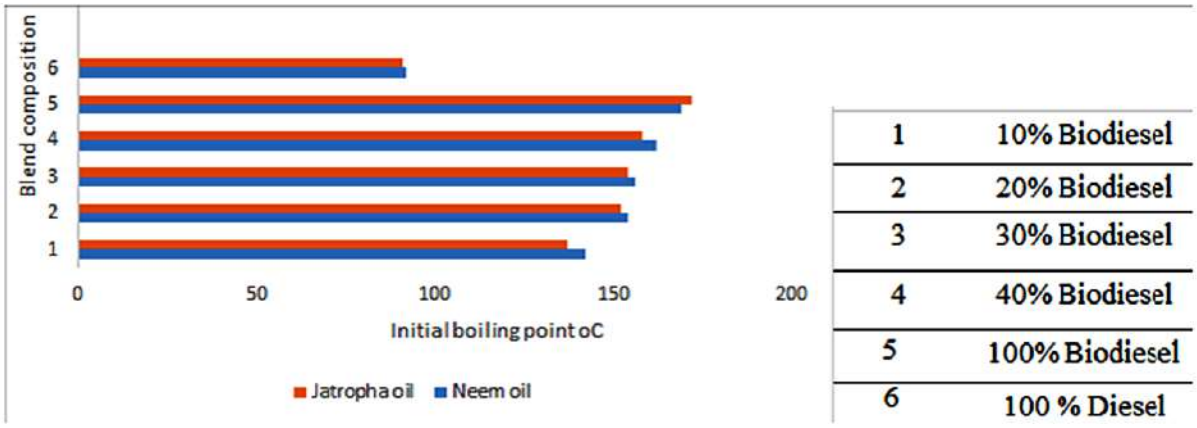
Figure 9. Initial boiling point for different blend compositions



Final Boiling Point

Need oil biodiesel blends for both 10% biodiesel and 20% biodiesel yielded 92% recovery and the final boiling points(FBP) 368 and 369^{0}C respectively indicating good distillation characteristics(Figure10). While for higher blends and pure neem and jatropha oil methyl esters, the FBP was not obtained due to cracking.

From the experimental study it was observed that for 10% jatropha biodiesel blend, the FBP was 363^{0}C with distillate recovery 92%, for 20% biodiesel blend, FBP was 365 ^{0}C with distillate recovery 92%(figure 10). For higher blends cracking was observed. As per ASTM distillation technique only 10% and 20% jatropha oil methyl ester blends in diesel is feasible.

Comparison With Past Work

Many investigators have investigated biodiesel synthesis using different oils. Table 2 summarizes significant past work for synthesis and characterization of biodiesel for different types of oils. The biodiesel synthesized using waste cooking oil can be made suitable for vehicles with use of deep eutectic solvent (DES) in the local moderate temperature climate (Khan et al.,2021). Biodiesel production from edible oil faces challenges due to cost of oil. Use of low cost oil can reduce this problem to considerable extent (Abdelrahman, 2020; Shaah et al., 2021).Feedstocks such as vegetable oils, nonedible oils, oleaginous microalgae, fungi, yeast, and bacteria have been utilized in various investigations(Chintagunta et al., 2021). Management of waste frying oil can be additional benefit of its use as starting material for biodiesel synthesis(Topi, 2020).Various aspects of biodiesel synthesis such as process design and simulation, sustainability evaluation, optimization and supply chain management needs to be studied and investigated further to render viability to the oil derived biodiesel(Pasha et al., 2021).There is higher emphasis for sustainability in fuel synthesis in the production of the third generation of biofuels(Vignesh et al, 2021). Advanced oil extraction technologies for biodiesel along with supercritical and microwave-assisted transesterification and novel catalysts are being explored(Zulqarnain et al., 2021; Jamil et al., 2021; Pikula et al., 2020).

CONCLUSION

Utilizing 100% methyl ester of neem oil or jatropha oil in diesel motor is unrealistic. Studies in recent past indicate that provide up to 40% oil yield per seed based on weight(Riayatsyah et al., 2022).Blends of 10% and 20% methyl esters of neem oil and jatropha with diesel meet the kinematic viscosity, pour point, diesel index and ASTM refining temperatures according to BIS values. So utilizing 10% and 20% blends of methyl ester of neem oil or jatropha oil with diesel may reduce 20% diesel requirement of the nation. Blends of 30% methyl ester of with diesel meet the kinematic viscosity(neem and jatropha oil biodiesel) and pour point(neem oil biodiesel, ASTM refining properties(jatropha oil derived biodiesel) according to BIS. However, it doesn't meet the diesel index(neem oil derived biodiesels), kinematic viscosity(jatropha oil biodiesel) and ASTM refining properties(neem and jatropha oil biodiesel). Use of 20% biodiesel blends of both types of biodiesels(neem oil and jatropha oil) can reduce petroleum diesel requirement by 20%.

Chapter 16
Characterization and Comparison of Various Blends of Honge Oil Methyl Ester (Biodiesel) With Diesel Fuel

ABSTRACT

The Honge oil, known as pongamia oil, is one of the most widely used lamp oils around the world. It is also used in leather tanning, in soap making, and as a lubricant. The Honge oil methyl ester can be used as an alternative fuel for diesel. The transesterification of methanol and Honge oil in the presence of base catalyst results in Honge oil methyl ester. In the current work, the Honge oil methyl-ester known as biodiesel was produced. It was mixed with petroleum diesel fuel in different proportions. Various physical and petroleum properties were investigated for Honge oil biofuel and also for various diesel and ester mixtures. The optimum parameters were temperature was 65^{o}C, catalyst quantity, 0.4 grams and oil: alcohol ratio, 1:6. The blends of 10%, 20%, and 30% compositions were most suitable as potential alternative fuel. Different proportions of biodiesel ester in diesel fuel have been also compared with petroleum diesel fuel to identify a suitable blend having good engine fuel potential.

INTRODUCTION

Worldwide economy runs on energy and with increase in population, the fuel demand is increasing rapidly (Natarajan and Venkatesh, 2012; Ahmad et al. 2009; Kumar et al., 2013; Patil et al., 2008; Hayyan et al., 2010). These needs, coupled with environmental changes, increasing costs and exhaustion of fossil fuel have motivated investigators to discover new energy assets (Georgianna and Mayfield, 2012; Ramadhas et al., 2004; A. Kumar and P. Kumar, 1984; Khan et al., 2007). Biodiesel has been considered to be one the best option forfuture fuel needs.Itcan be renewed because of its biodegradability (Bobade and Khyade, 2012; Santana et al., 2012; Ma and Hanna, 1999). Biodiesel creation from a renewable source can fulfill goals of a balanced environment and manageable monetary quality (Bobade and Khyade, 2012; Hossain and Salleh, 2008). Advantages of biodiesel are, its biodegradability and no requirement of alteration of engine to accommodate the fuel (Ahmad et al. 2009). Biodiesel can be smoothly blended (Anya et al., 2012; Saribiyik et al., 2010; Hribernik and Kegl, 2007). Any alternative fuel should be characteristically achievable, agreeable and financially feasible.

The source of Honge oil is the seeds of the Millettia pinnata tree. Karanja oil (in Hindi), Honge oil (in Kannada), Kanuga oil (in Telugu) and Pungai oil (in Tamil) are different terms used for this oil, Pongamia being the generic name. The Pongamia tree is around 40 feet tall after complete growth. Pink and white flower are grown on their branches. These mature and develop into brown seed pods (Allen O and Allen E., 1981). They grow in temperature range 0 to 40°C.Also they can survive in 5–25 cm annual rainfall. This tree grows wild on soil that is rough and hard (Meher, et al., 2004). The plant is nonedible, has harmful properties and can cause harmful effects on body if injected orally. However, it finds applications in the traditional medicines via its fruits, flowers and seeds (Bobade and Khyade, 2012). Honge plant derived oil and juices are effective on skin disease and have pest control abilities. Complete growth of this plant takes 10 years and it takes 5 years only to develop pods. A single tree can yield oil in the range of 10 to 50 kilograms depending on its size (Meher et al., 2004). Different methods like extraction and pressing (expeller and cold) can be used for Pongamia oil for its extraction from seeds. Pongamia oil is antiseptic and resistant to pests. The bitter flavonoid constituents results in disagreeable taste and odor and also has a high content of triglycerides.

In the recent years Pongamia oil industry has caught great attention in the global market. India, being one of the largest Pongamia producers, has a very important role in it. Pongamia pinnata (the Derris Indica trees) has been identified a definite source of next generation fuel. This plant can grow on barren and unused land. The plant has no food applications and hence its use as a source of biodiesel doesn't affect food requirement. High oil recovery is another important advantage of this source. All these advantages makes Honge oil, even more attractive alternative. This plant can minimize nitrogen requirement of soil as it can fix nitrogen from atmosphere.

Meng et al. (Meng et al., 2008) optimized the reaction temperature at 65^0C whereas Freedman et al. (Freedman et al.., 1986) suggested that optimal catalyst concentration is generally between 0.5 wt. % to 1.0 wt. %. The effect of ratio of oil to alcohol was also optimized experimentally at 1:6 by Alia and Taya (Alia and Taya, 2013). The major objective of the current investigation is to prepare the biodiesel from Honge oil and to study its petroleum properties, compare with pure petroleum diesel. Initially parametric studies were performed and parameters were optimized for experiments on different blend compositions. Prepared biodiesel and its blends were analyzed by comparing their properties with pure diesel. The words Honge oil and Pongamia oil are used in the investigation interchangeably.

MATERIAL AND METHOD

Material

Honge oil alkyl ester was synthesized with base catalyzed transesterification reaction. The oil was obtained from market and was provided by Jinendra Scientifics, Jalgaon. Potassium hydroxide used was manufactured by Hi-Pure Rankem Chemicals and Methanol provided was for laboratory use only of AR grade.

Method

The setup used for the synthesis of biodiesel is shown in figure 1. The synthesis of ester was carried out in the equipment using methanol and KOH. Optimum values of the parameters are indicated in table 1. By using waste vegetable oil(WVO), WVO oil to methanol ratio 1:12, 1% wt/wt of NaOH, reaction time 90 minutes were found to be optimum parameters by Elkady et al. (Elkady et al.,2015). Degfie et al. obtained 1:8 WCO(waste cooking oil) oil to methyl alcohol, 90 minutes reaction time, 0.01 weight fractionpotassium hydroxide loading rate as optimum parameters(Degfie et al., 2019). In another investigation, maximum yield was obtained at alcohol to oil molar ratio 6.18:1, 1% wt/wt KOH as catalyst and 66.5^0C(Kawentara and Budiman, 2013). The catalyst was properly shaken and mixed with the alcohol using stirrer. Proportion of hydroxide pellets and methanol was obtained after analysis of effect of various proportions on the yield. The Honge oil was exposed to high temperature to remove moisture content and mixed with methanol and potassium hydroxide mixture. The mixture was heated and agitatedfor 180 minutes and at 63 to 67 ^{o}C (Average 65 ^{o}C). The reaction mixture became turbid and changed to orange colour after 15 to 18 minutes. The colour became transparent with time. Completion of the reaction was identified from a sweet fragrance of the mixture. The mixture was then agitated and subjected to high temperaturefor 60 minutes more. The mixture was taken into a separating funnel to obtain layers ester and glycerol. Warm water was used to separate glycerol, soap and other impurities from the mixture. It was then treated with calcium hydroxide medium to minimize moisture level. The ester portion is the Honge oil biodiesel. The petroleum properties were studied of pure Honge oil ester and blends of this ester and diesel sample. The performance of blended samples was analyzed and compared with the pure diesel fuel properties.

Analysis of Biodiesel

The analysis of biodiesel and its various blends with diesel thus obtained is important in order to understand the properties and to compare them to diesel fuel in order to know its feasibility and viability. Various properties were studied from the analysis of biodiesel obtained from Honge oil. These include kinematic viscosities, diesel index, aniline point, flash and fire point, ASTM distillation properties,

specific gravity, API gravity. The determinations of these properties and their values along with the methodologies have been described extensively in the result and discussion section.

RESULT AND DISCUSSION

Evaluating Kinematic Viscosity Requirement

Kinematic viscosities for different blends are shown in figure 2. For any fuel used in diesel engine, the desired range of viscosity is necessity and prime requirement since it directly affects the ignition characteristics. According to ASTM D6571, the liquid fuel need to have the viscosity in the specified limit. The limit for diesel for its efficient and safe use is viscosity 1.9mm^2/s minimum to 6.0 mm^2/s maximum. The kinematic viscosities of diesel and biodiesel samples were determined by viscometer. The diesel has a kinematic viscosity of 2.5 mm^2/s at 40^{0}C while pure Honge oil has a viscosity of 7.25 mm^2/s. Viscosity of the Honge oil methyl ester was comparatively less than vegetable Honge oil (5.03 mm^2/s). The viscosities of 10%, 20%, 30%, 40%, 60%, 80% blends of methyl ester of Honge with diesel were obtained as 2.91mm^2/s, 3.26 mm^2/s, 3.81mm^2/s, 4.22 mm^2/s, 4.52 mm^2/s and 4.87 mm^2/s respectively. Up to 30%, Honge oil ester blends have comparable viscosity with Petro diesel.

Evaluation of Ignition Quality With the Help of Diesel Index

Ignition property of the liquid fuel is well represented by the diesel index. The optimum value should be closed to 45 as per mentioned specification of BIS. By knowing aniline point and specific as well as API gravity, diesel index can be calculated as:

Diesel Index value = Aniline point^{0}F x degree API Gravity / 100

Market purchased diesel fuel has a diesel index between 58 to 60 which is well above the specified value of 45. On the other hand, the diesel index of the Honge oil is approximately 16.2 which is far below the specification. Diesel index values for different blends are plotted in figure 3. A diesel index of 23.1 was observed for pure ester synthesized from Honge oil. Thus, use of pure Honge oil or its methyl ester in place of diesel will result in very poor ignition characteristics. Hence, Honge oil and its methyl ester alone doesn't have appropriate fuel characteristic from ignition perspective. It can be blended with diesel fuel. An addition of 10% methyl ester of Honge oil results in diesel index to 51.27 and 20% methyl ester of Honge oil has a diesel index of 48.1 which is above the specified value, indicating superior ignition property. For the different blends of 60% and 80% of methyl ester, the obtained diesel index is below the specified value and hence will result in very poor ignition property.

Evaluation of Aniline Point Property

Aniline point was determined to study fuel properties. A test tube with thermometer and stirrer was filled with dry sample and aniline. Sample and aniline mix completely. After cooling, the mixture become opaque. For determination of the aniline point, 5 ml of a carefully dried sample and aniline were filled in a test tube fitted with a thermometer and stirrer. On stirring, the sample and aniline are completely miscible. The apparatus is then cooled until the mixture is opaque. Then the temperature in increased slowly until the thermometer bulb is visible. Aniline point is the lowest temperature at which equal volume proportion mixtures of aniline and oil are completely miscible. Aniline point is indicator of aromatics present. Lower the aniline point, higher are aromatic compounds in the oil.

High values of aniline point temperature indicates that the fuel has high paraffinic hydrocarbon and hence has high diesel index, which is good ignition quality(figure 4). Determining aniline point is important in determining diesel index properties. Aniline point of diesel is 68 °C whereas that of 100% biodiesel is 29 °C. Aniline points of the blend of Honge oil methyl ester and high-speed diesel are lower compared to high-speed diesel. Compared to pure biodiesel obtained from Honge oil, these values were higher.

Evaluating Pour Point Properties

The pour point temperature evaluation is necessary for fuels to analyze their behavior in cold weather climatic conditions and their storage handling. The flow characteristics of liquid vanishes at pour point and liquid ceases to flow. A tube with flat bottom with dimensions 3 cm diameter and 12 cm height is

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

used for measuring pour point characteristics. It is kept in air jacket. The jacked in placed in a jar that contains the freezing mixture (Ice + $CaCl_2$). The tube is filled up to 50 percent height. A thermometer is inserted in the tube through cork. The temperature falls with cooling due to freezing mixture. For every 1 ^{0}C drop, the mixture is taken out and observed for cloudiness. Cloudiness is indicator of decrease in flowability. After every 3^{0}C drop in temperature, the sample was titled to check oil flow characteristic. Pour point is identified when the oil doesn't flow, even after complete horizontal tilting of the tube for 5 seconds.The Honge oil biodiesel at the minimum temperature of ambient condition will be free flowing. Pour point of Honge oil was -5°C which is far below the requirements. Pour point of methyl ester of Honge oil (100%) and 10%, 20%, 30%, 40%, 60% and 80% blends of methyl ester of Honge oil with diesel were experimentally obtained as 2°C, 5°C, 4°C, 4°C, 4°C, 3°C and 3°C respectively. Thus, increasing amount of Honge oil biodiesel in diesel, decrease in the pour point temperature was estimated. So, values of any blend of pour point temperature can be used since all values are close to diesel pour point value which is 5°C.

Evaluating ASTM Distillation Properties

Using standard ASTM Distillation apparatus, the initial and final boiling points and the temperatures for various percent recoveries of distillates were determined. Initial boiling temperature for diesel was 88 ^{0}C while for Honge oil biofuel it was 128 ^{0}C. There was rise in initial boiling point for 10 to 40% Honge oil biofuel blends in diesel (figure 5). The initial boiling temperatures were 130^{0}C,140^{0}C,142^{0}C and 146^{0}C for 10 to 40% Honge oil biofuel blends respectively. The initial boiling temperature represents ease of starting of an engine. The lower value of initial boiling temperature is desirable especially in chilled weather climates. However, it causes vapor locking problems. Greater values of Honge oil biofuel blends protect the diesel engine from vapour locking. For the 10% blend of Honge oil biofuel, the final boiling temperature was 362^{0}C (recovery 92%), for 20% blend, the temperature was reduced to 348 ^{0}C at same distillate recovery and for 30% biofuel blend, maximum boiling temperature was found slightly higher 352 ^{0}C (recovery 90%). For the next proportion of 40 percent Honge oil biodiesel blend, 8% recovery of distillate was recorded at temperature 278^{0}C. For higher honge oil methyl ester blends, cracking phenomenon was observed. Only the lower blends of honge oil ester would have proper ignition in diesel engine. Figure 5 and 6 depict initial and final boiling points for different blends.

under test is filled up to the mark in the oil cup. It was heated in the air bath by a burner. Flame was introduced for a moment, for every degree rise in temperature. The flash point is identified by appearance of distinct sound and light. The test flame is applied and heating is continued for some more time. The fire point of the oil is obtained by observing the test flame which burns continuously for minimum five seconds. Flash point of oil is about 5 to 40 ^{0}C lower than its fire point. The diesel fuel flash and fire points by open cup method were 68^{0}Cand 70^{0}C respectively.

The pure Hong oil biodiesel had higher values of 130^{0}C and 134^{0}C respectively. The flash and fire point values increased as the Honge oil methyl ester blend percent in diesel increased by every ten percent like 78^{0}C and 81^{0}C, 84^{0}C and 87^{0}C, 91^{0}C and 95^{0}C, 98^{0}C and 101^{0}C, 112^{0}Cand115^{0}C, 125^{0}C and135^{0}C respectively. Flash and fire points are indicators of possible fire hazard during the transportation of the fuel material and also in the storage and handling condition.

Specific Gravity and API Gravity Measurement

The specific gravity of diesel and Honge oil ester was 0.836 and 0.890 respectively. Figure 9 depicts specific gravity at different blend compositions. Specific gravities obtained for the blends were 0.837,0.841,0.853,0.867,0.878 and 0.890 in increasing order of their compositions(for every ten percent addition of ester in petrodiesel like 10,20,30,40,60 and 80 percent respectively). Higher values of specific gravity leads to higher values of diesel index. 10 and 20% blends were most suitable from diesel index analysis. The API gravity for diesel was 37.75 and for pure biodiesel it was 27.42. There was decrease in API gravity with increase in biodiesel proportion in the blend (Figure 10).

Cetane Number and Calorific Value Analysis

The samples were analysed for cetane number and calorific value(Table 2). These properties are very important as identification of good fuel.

Table 2. Cetane number and Calorific value

Cetane Number	52.1
Calorific Value	3780 kcal/kg

Cetane number, indicates speed of fuel burning. It also indicates the amount of compression required. For satisfactory operation of diesel engine, cetane values should be in the range, 40 to 55. Vegetable oil sources yield esters which have a cetane number range of 46 to 52. Size of the carbon chain is indicator of the calorific value. There is direct relation between the Cetane number and diesel index.Pure diesel has Cetane number of 50. Cetane values decreased with increase in biodiesel proportion in the blend(figure 11). For first four samples, up to 40% biodiesel content, the cetane number was found to be within satisfactory range(near 40).

Figure 11. Cetane numbers at various blend compositions

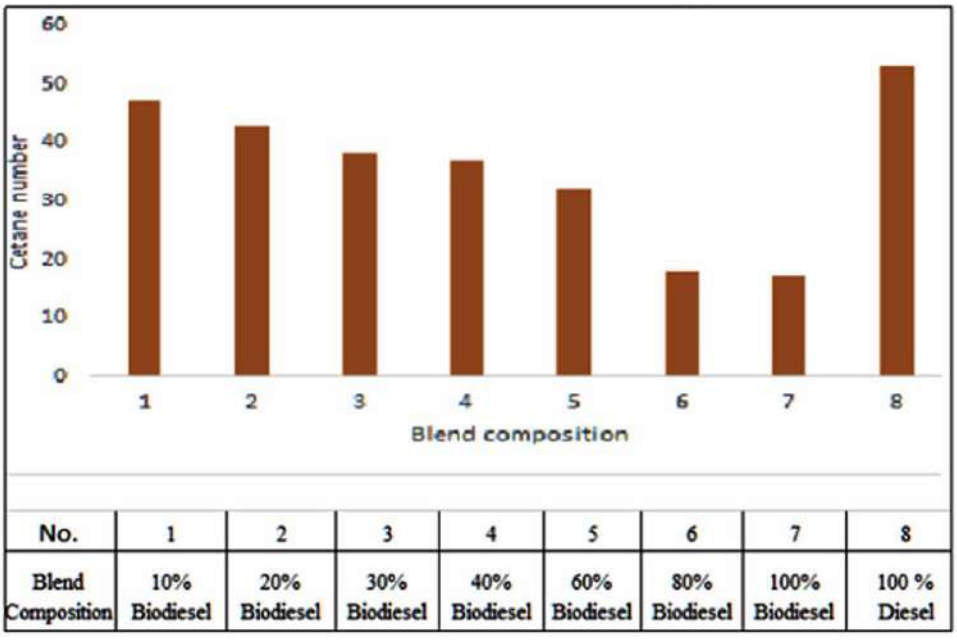

Table 3 summarizes the past work for synthesis and characterization of biodiesel for different types of oils. It can be observed that the optimum parameters and biodiesel characteristics are in the range of

Cotton seed oil	----------	Specific gravity0.890, Viscosity 3.6 mm^2/sec, flash point 155 °C, Cetane number 50.4, Calorific value 40000 kJ/kg	Singh et al., 2015

CONCLUSION

Use of pure Honge oil methyl ester as an alternative fuel for diesel will not be advisable as 100% Honge oil biodiesel because of viscosity. It can be used as 10, 20 and 30 percent blends and can be very useful alternate fuel. The higher blends like percent 40 and above have high values of viscosity and can create

Dr. Ashok Rathoure (asokumr@gmail.com)

ignition difficulties. The results obtained for kinematic viscosity, ASTM properties, specific gravity, aniline point, cetane number, flash point, fire point were in agreement with earlier investigations.(Natarajan and Venkatesh 2012; Ahmad et al. 2009; Kumar et al. 2013;Mamilla et al.2012). As per diesel index analysis and aniline point determination, the 10 and 20% blends were most useful. The specific gravity, flash and fire point and pour points of all the Honge oil ester blends were within the limits. The distillation property also recommends the use of lower blends up to 20 percent. The 20% Honge oil biodiesel has potential to reduce diesel usage by an equivalent amount and minimize environmental footprints.

ACKNOWLEDGMENT

Authors express their gratitude towards their affiliated institutes for their support and cooperation. Both the institutes (KBC NMU University Institute of Chemical Technology and Gharda Institute of Technology) have played motivational role in experimentation and preparation of this book chapter.

Chapter 17
Explicit Conceptual Design Approach to Adapt a Biomass-Fed Anaerobic Digester and Status Indicators in Semi-Arid Areas

Yusto Mugisha Yustas
Sokoine University of Agriculture, Tanzania

ABSTRACT

The mitigation of adverse climate change requires holistic strategies. The strategies include the proper handling of biomass wastes such as cow dung. The handling of the wastes has to be efficient using appropriately designed anaerobic digesters. In addition, the operating status of these digesters has to be monitored for detection of any fault of the digesters. Unfortunately, existing approaches for designing and monitoring the working condition of digesters have limitations. This chapter presents the innovative and explicit conceptual design approach of adapting the biomass-fed anaerobic digester and the digester operating-status-indicators in semi-arid areas. The approach is recommended to the renewable energy system designers. Finally, the appropriate indicators are recommended to be applied by the biogas plant operators or users.

INTRODUCTION

The performance improvement of biomass-fed anaerobic digesters for sustainable bioenergy generation is essential. Several ways of employing engineering design approaches are available for digester design improvement. In addition, the approaches are useful in adapting the anaerobic digester (AD). Adaptation refers to modifying the existing AD design to get its improved design with high performance (Divya *et al.*, 2015). The existing designs of the biogas plants have some pitfalls, which render poor plant performance. The pitfalls oblige the adaptation of the biomass-fed AD design. The adaption process involves

comprehensive engineering designing procedures, including conceptual design explained by Andreasen *et al.* (2015). The shortcomings noted in the methodologies presented by researchers, including Wu (2013) and Al *et al.* (2019), who applied the approaches for AD designing, impose the investigation of the innovative but explicit conceptual design approach. The faults of biogas plants harm the financial base of users, e.g. failing to attain the predetermined net present value, and polluting the environment. Additionally, the pollution of the environment due to the biogas plant faults, like biogas leakage, exacerbate the adverse climate change. Wu *et al.* (2019) and others have proposed several methodologies of monitoring the biogas plant working conditions intending instantly to track the faults. However, the methodologies have some limitations, including late detection of the faults resulting in the search for novel biogas plant working-status-monitoring methodology with appropriate indicators. Therefore, this chapter aims to demonstrate i) the development and application of the innovative but explicit conceptual design approach for adapting biomass-fed digesters and ii) the establishment of the novel biogas plant working-status-monitoring appropriate indicators.

BACKGROUND

Biomass is a renewable energy resource that harvests solar energy and stores that energy in the form of chemical energy. It includes animal, agricultural, and municipal wastes. Various ways are available to convert biomass into bioenergy, e.g., biogas. The conversion of biomass may be done through the anaerobic digestion process. The process is run without air while employing microbial degradation to produce biogas, among other by-products. The process is a proven technology. Several factors, including temperature, influence the technology of sustainable biogas generation and the state of feedstock applied (Theuerl *et al.*, 2015). Other factors affecting the efficient production of biogas from anaerobic digesters (ADs) include substrate pH, Carbon-Nitrogen ratio of feedstock, feedstock loading rate and particle size, hydraulic retention time and additives. The essential and critical factor, especially in batch-fed ADs, is temperature. It significantly affects biogas generation and other factors (Adekunle and Okolie, 2015). Here below is the information on the temperature relative to the biogas generation. The mesophilic state requires AD temperature to be within 20°C to 45°C. However, keeping the AD at a constant temperature, around 35°C, increases biogas generation. The biogas microbes survive optimally at a temperature variation of 0.5°C/day; henceforth, keeping ADs at temperature variations approaching this value is important (Rowse, 2011). Usually, biogas microbes can sustain temperature variation of ±3°C/day. Therefore, devising a simple temperature control system to reduce temperature variation of biogas digester toward 0.5°C/day is of paramount importance for sustainable biogas generation.

The feedstock employed in biogas generation may consist of dry matter of up to 15% wet basis for the liquid state digestion, i.e. liquid anaerobic digestion (LAD) or above 15% wet basis for the solid-state digestion, i.e. high solid anaerobic digestion (HSAD) (Li *et al.*, 2011). The HSAD feedstock has a much longer retention time and lacks control over the biological process (Li *et al.*, 2011). Therefore, it produces more biogas and needs less or no addition of water compared to the LAD feedstock. However, the HSAD feedstock needs a large amount of inoculum for exciting biogas generation (Yang *et al.*, 2015).

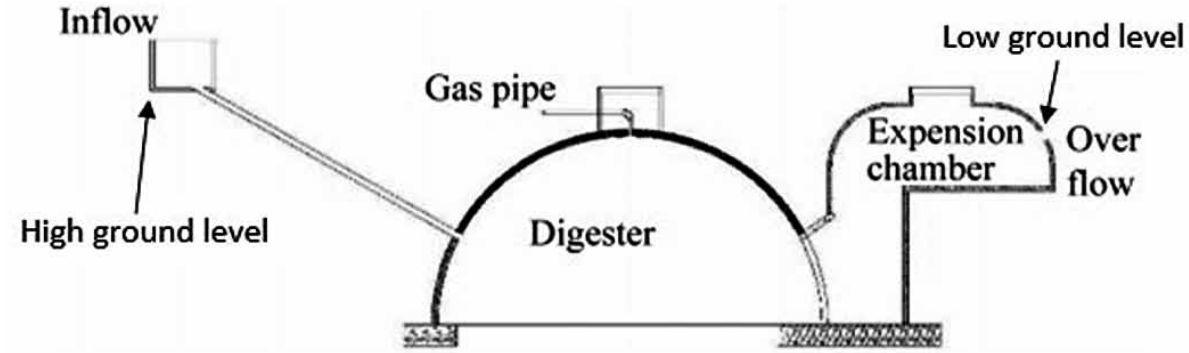
Biogas generation technology is essential for the sustainable energy supply to communities and conserving the environment (Surendra *et al.*, 2014). The technology is relevant in rural areas of economically growing countries of most sub-Saharan African regions. In these countries, Tanzania inclusive, the energy insufficiency rate, especially for cooking, is increasing (Kusekwa, 2011). The energy insufficiency is

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

caused by dwindling forest acreages resulting from the following: an expanded search for fuelwood, a traditional source of energy; enormous pressure exerted by population growth for habitation, and the surging expansion of agricultural and pastoral land (Ordway *et al.*, 2017). The effects of energy insufficiency are exemplified in rural semi-arid areas (RSAAs). The areas are found in central regions, for the case of Tanzania.

Strategies to abate the effects of the energy insufficiency in Tanzania involved introducing biogas technology in RSAAs under a subsidy scheme facilitated by non-governmental organisations (Wawa, 2012). The introduced technology was the continuous fed underground fixed dome digester ranging from 4 to 6 m^3 in size. It was a modified Chinese-type digester design, mainly known in Tanzania as the Centre for Agricultural Mechanisation and Rural Technology (CAMARTEC) type digester (Mrema *et al.*, 2011). Figure 1 illustrates this design. In addition, CAMARTEC has two biogas plant designs, one for humid regions and another for semi-arid areas. Troubleshooting faults, like leakages, in this biogas plant is challenging as they are underground installed. Besides, they are fed with feedstock of biomass and water at a ratio of one to one (Oloche *et al.,* 2017).

Figure 1. CAMARTEC digester design found around the study site
(Melinda et al., 2013)



Apart from the large-sized digesters, portable small-sized digesters are available in Tanzania. For example, Kusekwa (2011) reported the portable small-sized plastic digester design of about 200 litres capacity developed by the Dar-es-Salaam Institute of Technology in Tanzania. However, its performance and dissemination of information are not available. Furthermore, in 2012 a Netherland-based company, SimGas BV with Silafrica Company, introduced in Tanzania the small-sized biogas system, alias GesiShamba (Figure 2), with a minimum capacity of 2 m^3 and fed continuously with biomass and water at a 1:1 ratio (SimGas, 2018). The GesiShamba is made of cheap plastic material, making it portable, unlike the conventional biogas plant.

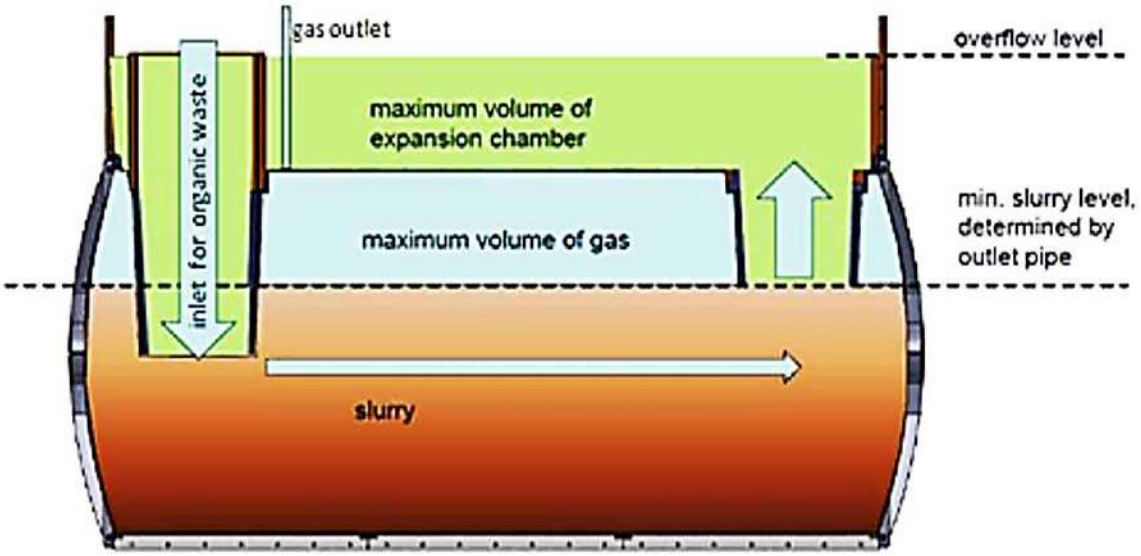
Figure 2. GesiShamba system design
(WB, 2015)



Aside from the designs mentioned above, other AD designs are used in Tanzania and other parts of the world. They include a floating drum (India type), separate storage (Sri-Lanka type), and plug flow digesters (Mrema *et al.*, 2011). Furthermore, by mode of operation, digesters are classified into batch-fed, semi-batch-fed, and continuous-type digesters. The batch-type digester for handling HSAD is simple and cheap in design compared to the others, although it has clogging problems (Kranert *et al.*, 2012).

The biogas, among others, contain methane (CH_4) content, which indicates biogas quality (Poulsen and Adelard, 2016). The high CH_4 content means high quality of biogas (Siefers *et al.*, 2010). Su *et al.* (2015) described techniques for improving the quality. The techniques include reducing impurities (Carbon dioxide, hydrogen sulphide, water vapour and ammonia) from biogas. The biogas plant auxiliary components for reducing the impurities include water traps and scrubbers filled with water, steel wools or other organic and inorganic materials like steel wools and activated carbon (Kulkarni and Ghanegaonkar, 2019; Awe *et al.*, 2017). Affordable auxiliary components facilitate the uptake of biogas technology in low-income communities in RSAAs. Enormous-sized biogas plants, for industrial application, of 100-m^3 capacity and 10 000-kPa pressure, support the biogas' purification up to 95% CH_4 content (Achinas *et al.*, 2017). The small domestic biogas plants of fixed dome or floating drum type mostly operate at low pressure, which may hardly reach 16 kPa because of being open to the atmospheric pressure at the substrate outlet (Zalm, 2017). However, for a batch-fed AD design, which is well sealed and the biogas outlet valve is closed, its pressure may rise above 16 kPa. Furthermore, the biogas flow rate in the low-pressure systems may decrease to 0.025 m^3/h. On the other hand, most applied standard biogas cooking facilities operate at a moderate biogas flow rate of 0.45 m^3/h (Zalm, 2017). Therefore, applying the low biogas flow rate directly while cooking is challenging. Therefore, cheap biogas storage is vital when operating small domestic biogas plants at low pressure and flow rate due to the prevailing weather conditions in semi-arid areas.

Several researchers have adapted the biogas plant designs using strategies explained by Divya *et al.* (2015). The adaptation involves connecting the mixing and recycling of leachate in the digester, adding

Dr. Ashok Rathoure (asokumr@gmail.com)

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

fixed-film on the surface inside the digester periphery walls, and/or adding pieces of inert materials (plastics, nylon, and sponge) in the feedstock to increase the contact surface area of biogas microbes' growth. In addition, it includes minimising the abrupt changes in temperature inside the digesters. Furthermore, the digester designs alteration for biogas quality increment and handling may be done by adding improved auxiliary components like a water trap for carbon dioxide gas and water vapour screening, a scrubber for hydrogen sulphide trapping, and separate robust biogas storage for releasing the biogas efficiently (Muñoz *et al.*, 2015). However, some of these adaptations are expensive, energy-intensive, and result in biogas plant operating challenges (Karellas *et al.,* 2010). Moreover, on-ground installed small-sized (200 - 1000 litres) ADs operated in individual households are unavailable in RSAAs to address the above-stated developmental and research gaps. Besides, limited literature is available on the small-batch type system to easily release biogas from the interior of substrates of high solid anaerobic digestion. Therefore, adapting batch-type AD for domestic purposes, which addresses the fore-explained challenges, is considered.

The system adaption process involves two main design procedures: detailed and conceptual design approaches (Al *et al.,* 2019). The systems designers that deal with various types of ADs apply both approaches. However, the approaches presented by Sánchez and Cardona (2012) are obscure, involve sophisticated and complicated tools (Wu, 2013), and models which do not adequately reflect the existing physical condition of the system being developed (Al *et al.,* 2019). In some cases, results based on these approaches are prone to biases by the designers. Moreover, understanding the monitoring of biogas plant working conditions reduces the risk of plant upset to generate the biogas sustainably. Several researchers have proposed methodologies for monitoring the status of ADs (Wu *et al.,* 2019). They proposed methods to monitor the digester conditions, including checking the substrates properties, percentage of biogas constituents, physical condition of the plant, and pressure variation. Other methods include checking the physical condition of the plant for damages or biogas leakage. However, the methods are time-consuming before identification of the faults, while some are difficult to implement depending on the design and installation of the biogas plant (Iswanto *et al.,* 2021). In addition, there is a lack of standard digester pressure curves indicating the leakage and the proper indicators of biogas microbes' activities inside the small-sized digesters. The challenges related to the adaptation process necessitate developing an adaptation approach for the digester design that is relatively clear, simple but effective and efficient biogas to facilitate sustainable biogas generation. In addition, the approach, which indicates the biogas plant's working condition at the appropriate time, is essential.

Therefore, this chapter presents and demonstrates the explicit conceptual design approach of adapting biomass-fed AD and the novel working condition indicators of the adapted anaerobic digestion system. The adapted AD may fit into any other renewable energy system to produce useful energy and bio-slurry.

EXPLICIT CONCEPTUAL DESIGN APPROACH OF ADAPTING THE BIOMASS-FED ANAEROBIC DIGESTER AND THE DIGESTER OPERATING-STATUS INDICATORS

There are several ways of adapting biomass-fed AD to produce biogas and bio-slurry. However, the approaches for adapting the digester based on the engineering design methodology presented by many researchers have several shortcomings, as noted in Sánchez and Cardona (2012) and Al *et al.* (2019). Additionally, a quick and reliable approach to identifying the faults of biomass-fed ADs facilitates a rapid

Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

remedying of malfunctioning ADs. However, systematic methods proposed for monitoring the digester operating status have limitations, as Wu *et al.* (2019) and Iswanto *et al.* (2021) explain. Furthermore, there is a lack of standard digester pressure curves indicating the leakage and appropriate indicators of biogas microbes' activities inside the digesters. These indicators are vital, as they closely reflect the working condition of the digester. The solutions to these shortcomings and limitations reinforce the theme of Biomass and Bioenergy Solutions for Climate Change Mitigation and Sustainability.

With that briefing, this chapter provides the explicit conceptual design approach of adapting the biomass-fed AD and demonstrates its application. The approach's demonstration involves adapting the batch-fed AD for effective cow dung degradation for sustainable biogas generation. Besides, the appropriate digester operating-status indicators are established and presented.

The research area of this study included the Department of Engineering Sciences and Technology at Sokoine University of Agriculture (SUA), located in Morogoro, Tanzania. In addition, it involved Chamwino District, Dodoma region Tanzania. The region represents semi-arid areas.

Formulation and Demonstration of Conceptual Design Approach of Adapting the Biomass-Fed Anaerobic Digester

After a thorough review of literature related to engineering design approaches and frameworks, intuitively, the AD adaption approach was formulated. Figure 3 illustrates the approach. The approach employs the adapted engineering procedural and research techniques. These guide the adaptation process of the biomass-fed AD design. Authors executed several tasks during the adaptation process in the field than in laboratories and workshops of research centres. In addition, the approach involves input, processing and output phases. The inputs phase includes reviewing the literature on the functionality of various existing designs of digesters, developing design criteria to be achieved by the intended components or system to be adapted/re-designed, synthesising the working principles (WPs) or concepts as per design criteria, and selection of the best working principle (WP).

The processing phase comprises the conceptual design of the selected best WP, fabrication, fixing of the fabricated components, and assembly of the digester system using materials and tools available in the workshop. Finally, the assembled system enacted the output phase as the intended biomass-fed digester; the digester was adapted batch AD for this study.

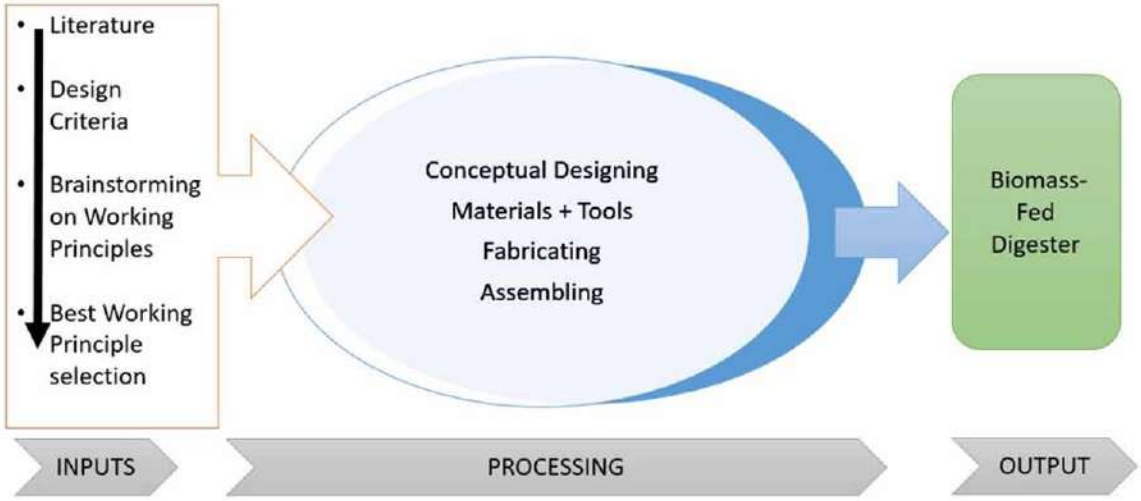
Figure 3. The framework of adapting the biomass-fed AD



The Inputs Phase of the Adaption Framework

After a thorough literature review of various digesters' designs and operations (Garfi *et al.,* 2016), the authors selected the batch-fed anaerobic digestion system for use. The design simplicity, low cost and ease of operation guided the selection of the system. However, this system needed an adaptation to offer the intended service of increased generation of quantity and biogas quality. The basis of achieving this result was the design criteria explained in the subsequent sub-sections and the approach shown in Figure 3.

The Batch Anaerobic Digestion System Design Criteria

The criteria formulated as a basis for devising the intended system are the ability to withstand the pressure of about 16 kPa; biogas tight seal capacity/airtight sealing by 100%; self-mixing during operation; possible self-leachate re-circulation during operation, and increased contact surface area of biogas microbes. Other criteria include easy passage of biogas from the interior of substrates; easy to operate; ensuring no biogas outlet clogging; availability of raw materials locally; less cost involved; more durable and easy manufacturability.

Synthesis and Selection Approach of Best Working Principle

1. Synthesis of the Working Principles

Based on the criteria, the authors generated WPs of all batch anaerobic digestion system components. The components include the digester, the water trap, the scrubber, biogas storage and the piping system. Table 1 shows details of the generated digester WPs. The unscaled drawing in Figure 4 illustrates the generated digester WP with various types of top cover.

The WPs of biogas storage thought of are the following: inflatable plastic bag (BSWP1), inner tyre tube - of various sizes (BSWP2) and inflatable plastic bag covered with clothes (BSWP3). The consideration of the WPs of the piping system was to comprise one, two or three types of pipe. Authors of this chapter assumed a total length of 1.7 m of the piping system without including fittings for computing the percentage of the length of the type of pipe in the whole system. The percentages and combinations of types of pipes differentiate the WPs generated. Table 4 shows the intuitively generated WPs of the piping system.

2. Selection Methods of the Best Working Principle

Best concept selection techniques are available. They involve Decision Matrix Analysis (DMA)/grid analysis, ABC analysis, and Pareto analysis; Analytic Hierarchy Process (AHP) based approach, anonymous voting technique, cost-benefit (CB) analysis, and Failure Modes and Effects Analysis (FMEA). Other concept selection techniques include Plus-Minus and Interesting (PMI) analysis, Kano model, nominal group technique, Sticking dots, and "Strength, Weakness, Opportunity and Threat" (SWOT) analysis (Mardani *et al.*, 2015). The following criteria are applied in choosing an appropriate selection technique of the best WP: its simplicity in application, ability to single out one best option, quick sorting of more than three options and diverse application in different disciplines, which include designing renewable energy systems.

With the procedure mentioned above, the authors found that CB analysis, SWOT analysis and Kano model are discipline-specific for financial, business, and marketing analysis, respectively. Additionally, the ABC analysis utilisation intends to prioritise one among the three options only and for controlling inventories. Furthermore, Pareto analysis uses the 80/20 rule, i.e. only 20% of options influence 80% of the same options. Therefore, it renders the analysis unable to single out one best option. The Analytic Hierarchy Process (AHP) based approach is complex to apply. It requires special software tools to perform the calculations, which involve the concept of Eigen-vectors, to get the best option.

The anonymous voting technique is very subjective and based on individuals' opinions. Additionally, FMEA was found to fit in identifying potential failure modes, determining their effect on the operation of the product, and identifying actions to mitigate the failures (Rebernik *et al.*, 2008). However, it is complex to apply, as it is impossible to anticipate every failure mode. The PMI analysis employs finding positive, negative and interesting points of an idea leading to its decision being entirely subjective regarding the most appropriate idea screening technique. The Nominal Group Technique is useful for prioritising ideas and projects rather than choosing one best option. At the same time, the Sticking dots analysis found is the quick method for determining priorities by voting. The Sticking dots analysis is useful for collecting opinions early in the idea selection process.

The review of DMA showed that the technique evaluates an idea as per criteria (Mardani *et al.*, 2015). It is simple and allows quick sorting of options/concepts by identifying their relative strengths and weaknesses. The DMA is applied in different areas of study, including designing renewable energy systems (Abu-Taha and Daim, 2011). However, the careful setting of scoring criteria is necessary for

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

the expected useful results (Abu-Taha and Daim, 2011). Therefore, this study opted for the application of the DMA method.

3. Application of the DMA Method

The best WPs were selected using the DMA method as applied by Olabanji and Mpofu (2014). In this procedure, the weight values assigned to design criteria are based on their importance to ensure the component or the system needs to meet the requirement set. Experts in renewable energy, system design, and mechanical engineering assigned a weight to the design criteria. The selection of experts to participate in the weight values assignment exercise was made intuitively by considering the expert's experience to design and operate renewable energy systems and machines involving fluid systems. The authors contacted twenty experts to participate in this exercise, but only thirteen were effectively ready. Therefore, eight renewable energy system developers and five mechanical engineers were involved based on their readiness to participate in this task.

The fore-mentioned weight assignment process produced the weight values in brackets. The presentation of assignment results is as follows: the ability to withstand the pressure of about 16 kPa (0.21), biogas tight/airtight at 100% sealing (0.4), and self-mixing during operation (0.01). Others were the following: possible self-leachate re-circulation during operation (0.01), the increased surface area of contact for biogas microbes (0.03), easy passage of biogas from the interior of substrates (0.08), easy to operate (0.1), ensuring no biogas outlet clogging (0.05), availability of raw materials locally (0.04), less cost involved (0.03), more durable (0.02), and easy manufacturability (0.02).

Moreover, factors with their corresponding rating on Likert factor scale values in the bracket needed to determine the possibility of the WPs meeting each design criteria were intuitively set as follows: not at all able (1), lowly able (2), moderately able (3), highly able (4), and very highly able (5). Furthermore, the weighted score of the WPs relative to each design criterion was determined as the product of design criteria weight and the rating on Likert factor scale values. Finally, the total weighted score for each WP was determined by summing up the weighted scores.

Above mention analysis produced plots of the total weighted score against the WPs. The authors selected the WP with the highest total weighted score as the best. However, for those WPs that did not produce conclusive weighted scores, testing results interpretation of the prototypes was a basis for their selection. For instance, this happened when WPs assignment of the same rating of at least three for the highly weighted design criterion that weighs more than 0.21. The authors fabricated the prototypes as no cheap and reliable alternative way to evaluate them was feasible at that particular time and place.

4. Selection Results of the Best Working Principle

In this subsection, the authors present the results of selecting the best WP of the ADS components. The tested fabricated prototypes are the water trap, scrubber, and biogas storage, regarding the purpose of the best option selection. This exercise considered the leakage problems where the prototype was filled with air to a safe pressure of 8 kPa. Any sign of leakage was detected by immersing the prototype in water or pouring water on it. The selected best options resisted 100% of the leakage at the stated pressure. If more than one option passed the test, the authors applied the prototypes' total weighted score for the selection. Additionally, the authors considered another new WP for conceptual designing if all options failed the test.

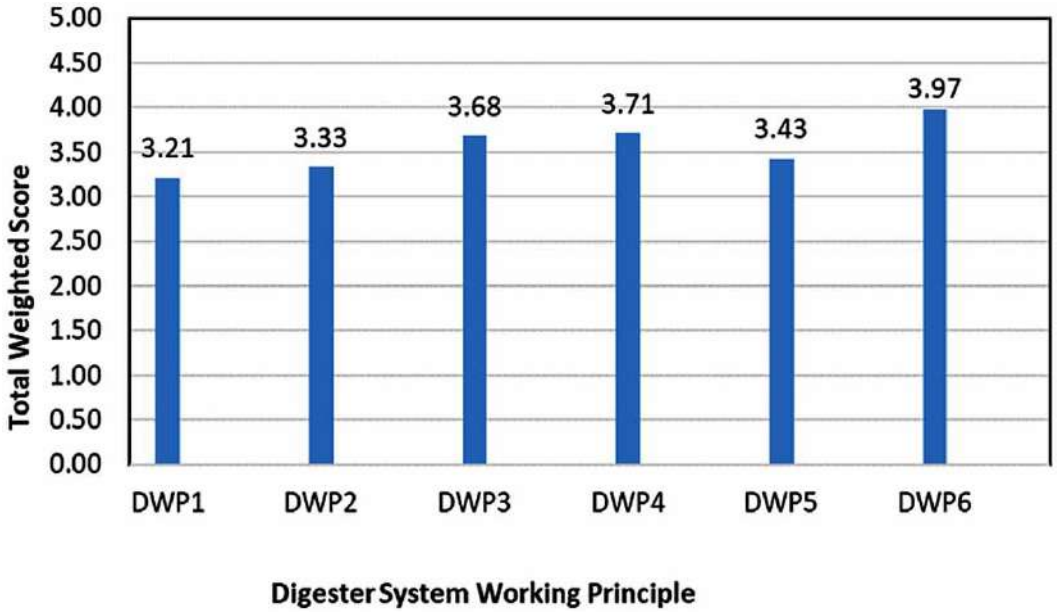
1. Selection of the working principle of the digester

The results obtained and shown in Figure 5 reveal that a working principle DWP6 secured the highest total weighted score of 3.97 and was then selected, meaning it was the best of all WPs. Note that a frame of flat iron bars encases the plastic drum.

Figure 5. Decision matrix analysis results for digester working principles



The score of 3.97 by DWP6 was based on the high likelihood of the following: the gasket rubber to offer an airtight sealing and withstanding 16 kPa pressure, and the central core and its four wings to allow easy passage of biogas from the interior of the substrates. The ease of passage of biogas from the interior reduces the possibility of building up a biogas mass at the bottom of the digester, pushing the substrate mass up, and leading to system clogging.

The central core offers a space for releasing the leachate into the bottom centre of the digester, as it is perforated and not filled with cow dung during digester feeding. Additionally, the leachate may rise to wet the above substrates through the perforated wall of that central core and its wings as the digestion process continues. Authors assumed that as the leachate mass finds space in the central core, the solid substrates drop down to occupy its space. In doing so, kneading solid substrates by the central core wings is possible.

Moreover, the provision of the central core and its wings results in increased contact surface area for the growth of the biogas-generating microbes in the central mass of the substrate. There was a likelihood of increased biogas microbes as they would be away from the possible rapid changes of temperature near the wall of the digester. The rapid temperature changes affect the performance of the microbes adversely.

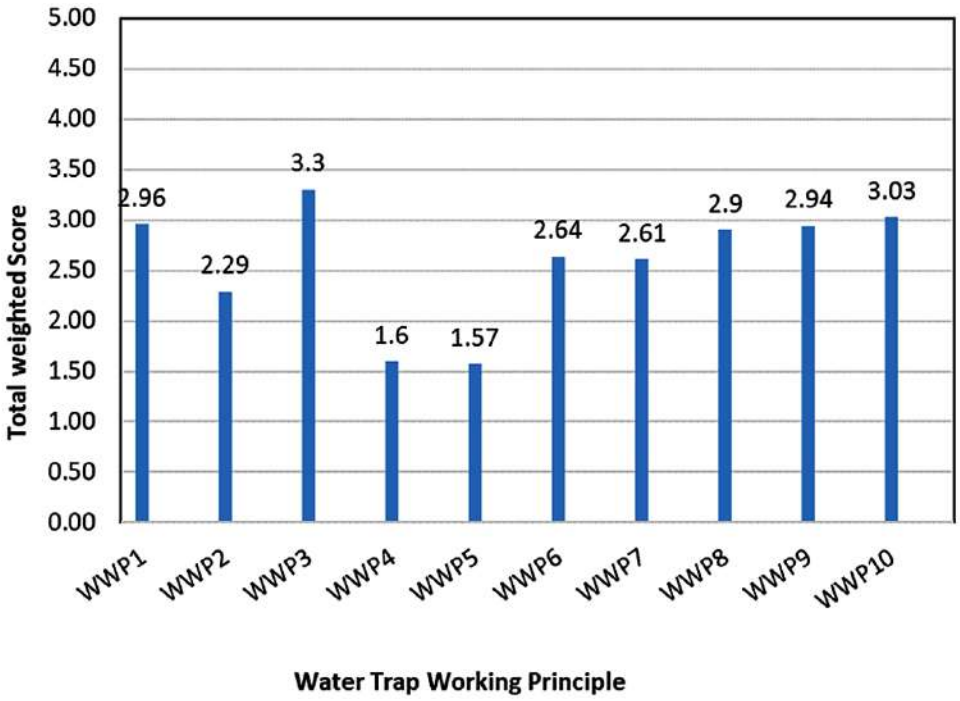
Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

The iron bar frame supports the gasket for airtight sealing as it holds together the top lid and the plastic drum of the digester, even above 16 kPa pressure. According to Tubecon (2018), a flat bar may withstand more than 16 kPa under tension, a factor of safety exclusive.

2. Selection of the water trap working principle

The DMA results were inconclusive regarding the high-weighted design criterion for the water trap WP. Therefore, the authors fabricated the three water-trap prototypes for leakage testing. The concepts in question are WWP1, WWP3, and WWP10. All three concepts had equal-weighted scores for the high-weighted design criterion of withstanding airtight sealing. Therefore, WWP3 was best option selected for sealing the leakages by 100% and having the highest-scoring of the total weighted score after the leakage test, as shown in Figure 6.

Figure 6. Decision-matrix analysis results for water trap working principles



The authors filled the water trap with a 140 ml volume of freshwater. Then, the authors applied trial and error methods to determine the volume while ensuring no water and air inflow to the digester and outflow beyond the water trap on the accidental opening of the system to air. As a result, water enhances moisture and Carbon dioxide (CO_2) trapping. Note that, by assuming the annual mean atmospheric pressure of 101.9 kPa at the study site (TDA, 2018) and pressure and temperature of both 6 kPa and 28°C, respectively, in the water trap, the authors considered the solubility of CO_2 in water as 15 ml of CO_2 per one gram of water (Diamond and Akinfiev, 2003). Therefore, a process removes about 2.1 litres of CO_2 from the 7 litres of biogas (assuming biogas contains 30% of CO_2) passing through the water trap.

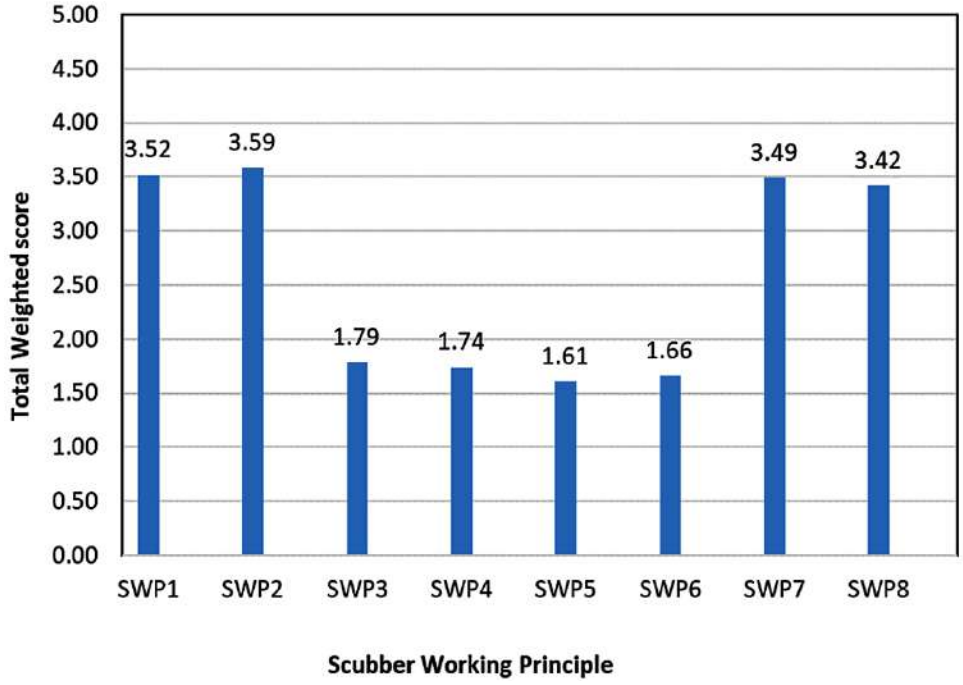
3. Selection of the working principle of the scrubber

The authors subjected the SWP1 and SWP2 to the leakage test while parked with iron wools. Both concepts were not leaking at all under testing conditions. Therefore, the selection is based on the total weighted score shown in Figure 7. Following these results, the authors selected the SWP2, with a score of 3.59, as the best scrubber design to be incorporated in the intended anaerobic digestion system.

Figure 7. Decision matrix analysis results for scrubber working principles



4. Selection of the working principle of the biogas storage

Three concepts of biogas storage facility under the subjection of the DMA produced results shown in Figure 8. The two concepts, the inflatable plastic bag (BSWP1) and the inner tyre tube (BSWP2), further passed leakage tests after fabrication prototypes. However, the BSWP1 performed poorly; therefore, the authors selected the BSWP2 as biogas storage's best option and included it in the list of components of the ADS. The used tyre tube sizes were 7.5-15 (TR174A), 8.25-16 (TR177A), 9-20 (TR177A) and 12-24 (TR177A.).

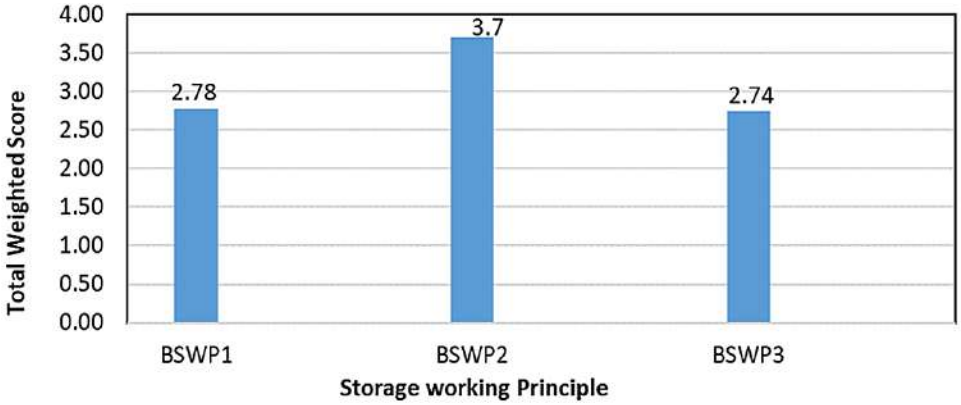
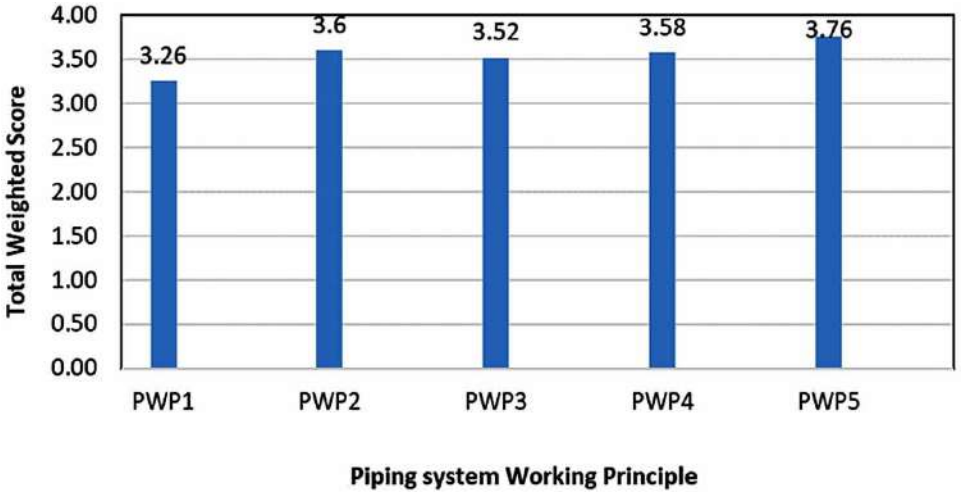
Figure 8. Decision matrix analysis results for biogas storage concepts



5. Selection of the working principle of the piping system design

The results from the DMA, as shown in Figure 9, guided the selection of the best piping system option. The option PWP5 (IPS plastic pipe (70%) + other flexibles (25%) + horse pipe (5%) + IPS fittings) secured the total weighted score of 3.76, which was the highest, leading to its selection as the best option.

Figure 9. Decision matrix analysis results for piping system concepts



The Processing and Output Phases of the Adaption Framework

The authors did the conceptual designing of the selected WPs in the processing phase. After that, using predetermined materials and tools, they fabricated and assembled all the conceptual designed components to produce the wholly anaerobic digestion system. Finally, the fully assembled system activated the output phase.

1. Materials and Tools Applied for Fabrication of the System

The materials used were fabrication consumables and items, including IPS plastic pipes (50 mm, 38 mm, and 13 mm diameter); standard plastic pipes (25 mm and 100 mm diameter. Other materials were the 240-litre plastic drum (2.2 mm wall-thickness), IPS fittings (13-38 mm diameter), bolt and nuts of N10 (8 mm diameter), flexible tube clamps, and a Grade S235JR - 25 x 2 mm flat bar (EU standard); 13 mm diameter flexible water pipes and thread seal tapes. Other materials used were putty sealants, gasket rubbers, plastic sheets, and pieces of inner tyre tubes. Additional materials were the 2.5 mm square wires and butyl tyre inner tubes (Korean Standard, made in India) of sizes: 8.25- 16, 9-20, and 12-24, all with valves type TR177A and 7.5-15 with valve type TR175A. The metalwork and plumbing workbench tools were used during the fabrication.

2. Fabrication and Assembly of the ADS and Its Components

Authors fabricated all selected components of the system except those selected during the second stage of selecting the WP, as their prototypes were utilised directly. Then the final finishing of all components was done. Afterwards, they were assembled by connecting the batch-fed digester, water trap, scrubber, biogas storage and biogas cooking stove to produce the whole ADS. Next, the steel wool and 140 ml of soft water were filled into the scrubber and water trap to end the processing phase. Finally, the complete ADS with the digester, the water trap, the scrubber, the storage, and the piping system was ready for use in the output phase of the approach as the adapted batch-fed anaerobic digestion (ABFAD) system. Figure 10 illustrates the complete connected ABFAD system ready for use or incorporated into the integrated renewable energy system.

The Formulation and Demonstration of Digester Operating-Status Indicators

The authors reviewed the literature related to the assessment of the working condition of the biogas plants to collect information regarding the challenges of the monitoring process of the plant indicators applied. In addition, they considered the application of biomass-fed digesters in the semi-arid areas of least developing countries. The review outputs resulted in selection variables representing the indicators for demonstration using the assembled ABFAD system. The selected variables are piping system and digester temperatures, system pressure, methane content, pH and dissolved oxygen (DO).

Furthermore, the authors demonstrated the application of the ABFAD system by conducting experimental testing involving data collection. The testing involved using biomass waste, which is cow dung. The cow dung had the following properties: dry matter (DM) and Carbon Nitrogen ratio (C/N ratio) of 228.93 g/kg of feed (standard deviation of 5.21 g/kg) and 19.30 (standard deviation of 0.56), respectively.

Instrumentation and Measurements for ABFAD System Testing

A list of essential instruments and tools used during this study include the following:

1. UGT Humidity and temperature (thermocouple Type-K) sensor with Relative Humidity (RH) measuring range of up to 100%, humidity accuracy of ± 2% and temperature measuring range of -30.00 - +70.00°C with the accuracy of 0.01°C. The sensor connects, picks signals, and transfers them to the UGT DL 386 data logger. The authors set the sensor to sample ambient air temperature values at the one-hour interval.
2. Micro Footprint Dissolved Oxygen (DO) monitoring subsystem equipped with the DO circuit of Version 4.0 for hardware and firmware (*Atlas-Scientific.com*), with a full range of DO readings from 0.01 to +35.99 mg/L and the accuracy of ± 0.2, set to sample data after 15 minutes interval,
3. The device applied to measure the acidity or alkalinity of the ageing substrate in the digester was the Micro Footprint pH-monitoring subsystem. The device is equipped with a pH circuit Version 4.0 for hardware and firmware (*Atlas-Scientific.com*), with full range pH reading from 0.01 to 14.00 and accuracy within two significant figures (XX.XX); set to sample data after 15 minutes interval.
4. Ultrasonic biogas flow meter Version BF-2000 with a flow range of 0.025 – 4.000 m^3/h, methane (CH_4) content percentage to the total volume of the biogas measurement range of 30-100% (accuracy is 0.01%), temperature measurement ranges from -20°C to 60°C (accuracy being 0.01°C), the working pressure of less than 100 kPa and explosion-proof grade of Ex ibiiat4 Gb; CH_4 content was measured at three-hour interval, and
5. Simgas pressure gauge encased in plastic material with a measuring range up to 16 kPa with an accuracy of 0.5 kPa.

A Solar PV module with a battery bank powers all electronic instruments. Furthermore, the authors calibrated all the instruments for measuring pH, DO, digester temperature, room temperature, ambient air temperature, CH_4 content, pressure and piping system temperature and fixed them to the ABFAD system. In addition, the authors inserted probes for measuring pH, DO, and the digester temperature deep to 0.7 m from the top of the digester and axially 0.1 m away from the central core. The probe insertion was followed by feeding the digester with cow dung—Figure 11 illustrates the experimental setup.

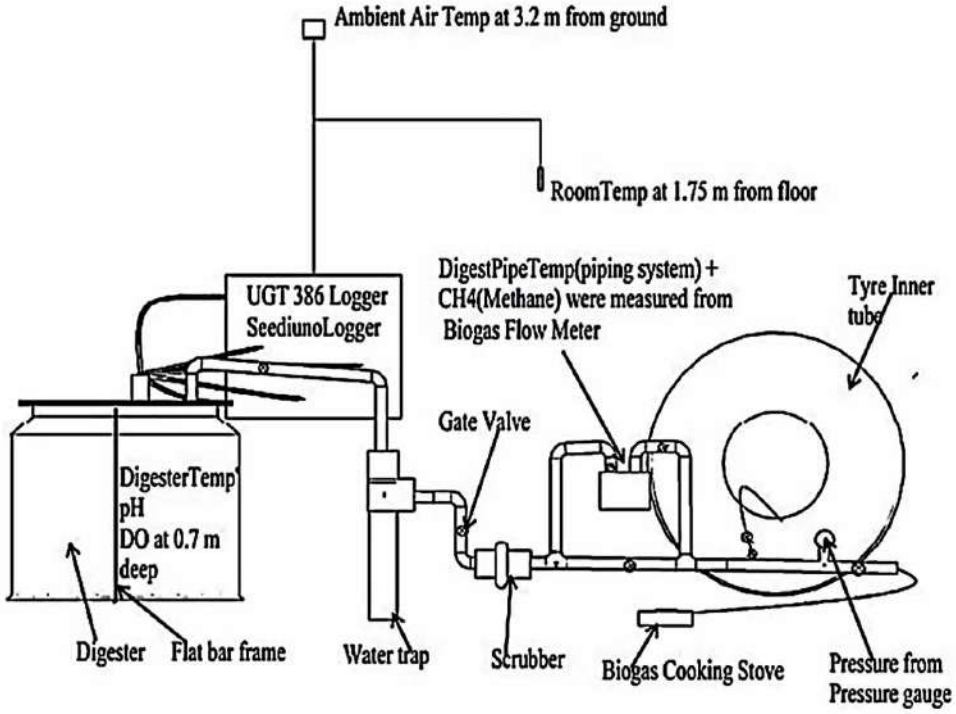
Figure 11. Experimental set up of adapted batch anaerobic digestion system



A room with a wall thickness of 0.3 m made of muddy materials (sandy clay soil) and lined with cement mortar accommodated the experiment. The inside, front and part of the outside left sides' room surface were lined. The room was slant roofed by corrugated iron sheets (gauge 30) with low and high heights of 2.5 m and 3.1 m, respectively. Its floor plan had 3.7 m by 5.1 m dimensions. The room had a screening floor (0.15 m thickness). Furthermore, the room had a window (0.6 m by 0.5 m dimensions) made of wooden frames and fitted with glass (2 mm thick). The room door (1.8 m by 0.8 m in dimensions) was made of timber and a corrugated iron sheet (gauge 30).

Furthermore, the collected data was analysed to get the average temperature, standard deviations, and rate of change of temperature (^{o}C/h) values. The rate of temperature change was determined by dividing the standard deviation temperature by the mean of a given factor by 24 hours of a day.

Experimental Test Results and Discussion

The results include the independent variables: ambient air temperature, temperature response variables of room, digester and piping system. In addition, the results included the CH_4 content in the biogas, pH, DO inside the digester and pressure of the whole system. These parameters are essential for the technical evaluation and running of the system.

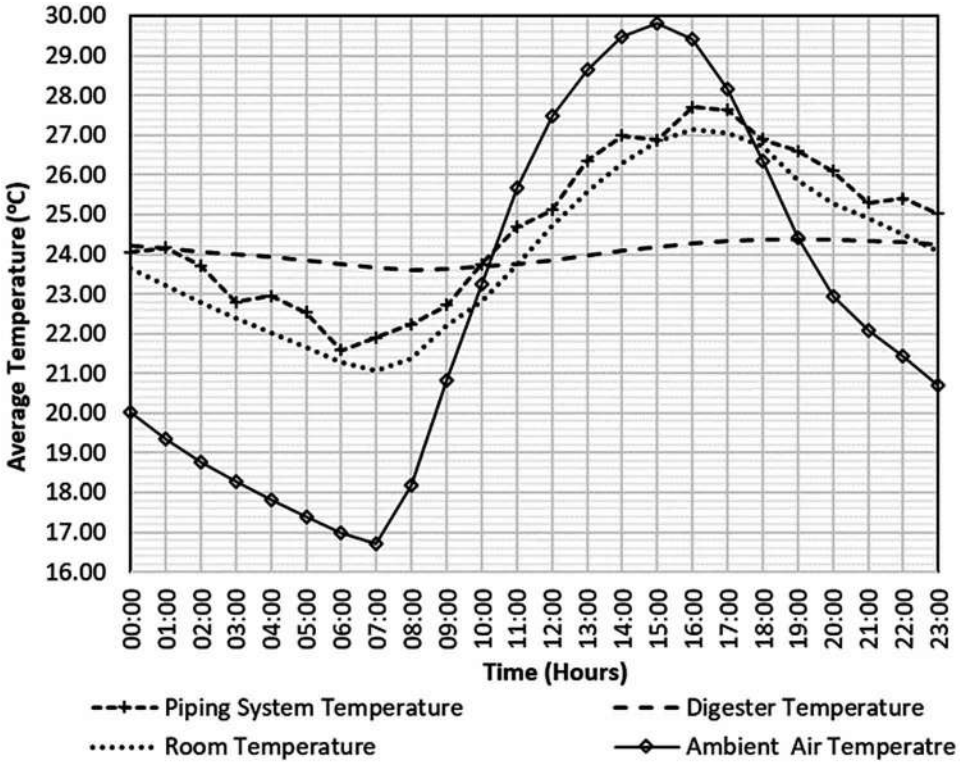
Temperature and CH_4 Content of the ABFAD System

The similar trends of the proportional relationship among temperature of the piping system, room, the digester and ambient air are shown clearly in Figure 12. The figure shows an analysis of the temperature data on an hourly basis within a day. Moreover, the figure shows that the piping-system temperature curve is not smooth compared to the other curves. The piping-system temperature curve indicates that temperature oscillates as it follows the trend of room temperature. The oscillation may be due to the intermittent flow of varying amounts of biogas at a low-temperature level through the piping system from the digester. Usually, the digester has a lower temperature compared to the piping system most of the time.

Figure 12. Hourly average temperature variations in ABFADS (Jun 16 - Oct 1/ 2017)



The authors computed the temperature change rate based on standard deviation from the mean temperature of the piping system, room, digester and ambient air. Table 5 shows the values of factors obtained for each of the ABFADS parameters. It shows that the temperature change rate inside the digester was the lowest with the value of 0.01°C/h, while ambient air was highest at 0.18°C/h. This revelation indicates that any ADS installed outside must be away from ambient air temperature variation, which has been the case for all biogas plants installed outside. The high-temperature variation affects biogas microbes adversely.

Table 5. Temperature rate of change and other factors of ABFADS's parameters

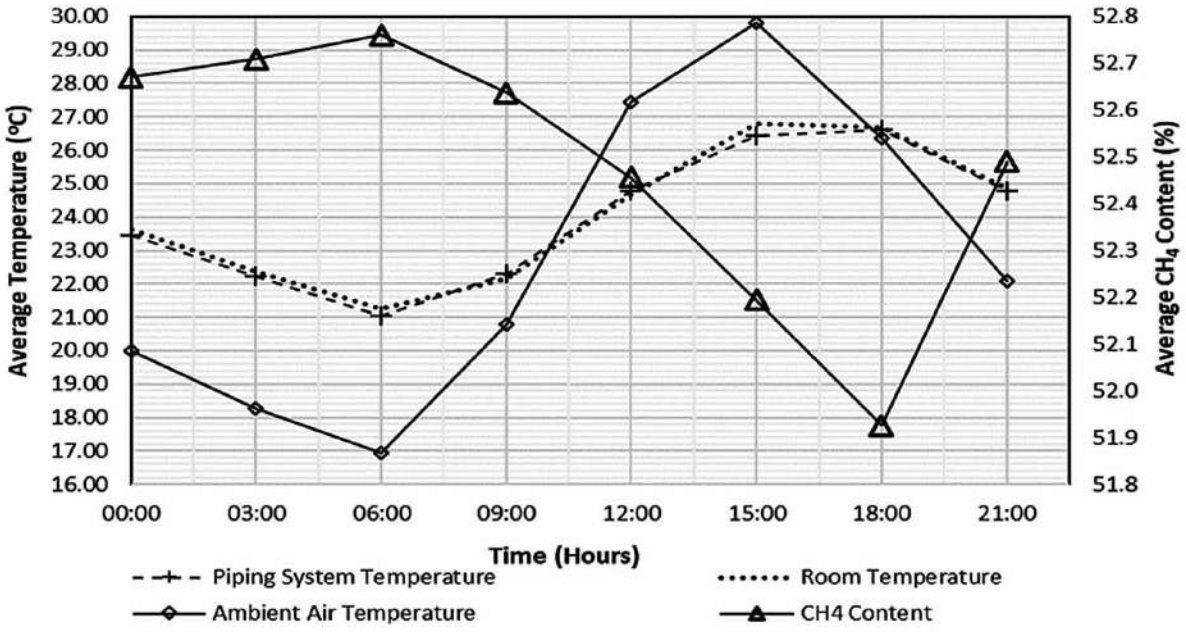
Factor (unit)	Parameter			
	Piping System	Digester Temperature	Room Temperature	Ambient Air Temperature
Mean temperature (°C)	24.71	24.04	24.05	22.67
Standard deviation (°C)	1.86	0.26	1.95	4.38
Temperature rate of change (°C/h)	0.08	0.01	0.08	0.18

Additionally, the average digester temperature of 24.04°C shown in Table 5 indicates that the AB-FADS was operating in the mesophilic phase of temperature, i.e. 20-39°C of anaerobic digestion. The optimum temperature for mesophilic microbes' performance is 35°C.

The digester's low temperature change rate indicates that the substrate mass exhibited insulation behaviour towards the center of the digester. This situation seems true, as the temperature probe for measuring digester temperature was close to the central digester core. Moreover, the room walls and air-insulated the digester from an extreme variation of ambient air temperature regarding the experimental setup. The phenomenon is evident from the closeness of temperature trends of room and digester piping systems and their rate of change (Figure 12 and Table 5).

The ambient air, room, and piping system temperatures are inversely proportional to CH_4 content between 00:00 and 15:00 hrs (Figure 13). Furthermore, the temperatures decrease at the different slopes with CH_4 content between 15:00 and 18:00 hrs before the ambient temperature decreases fast than a room and piping system temperatures. In contrast, CH_4 content increases fast to 52.65% in a range of 18:00-00:00 hrs.

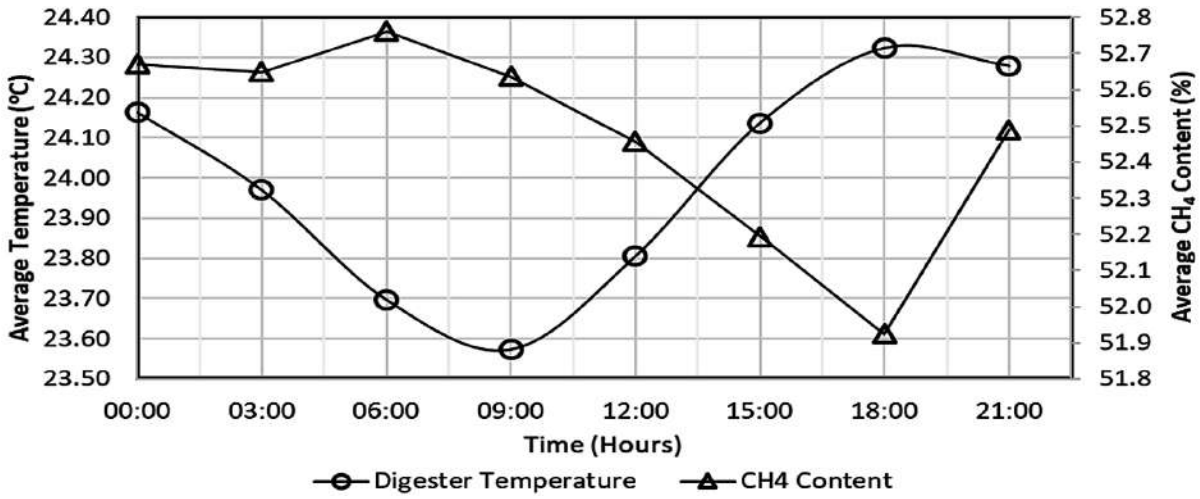
Figure 13. CH_4 content and piping system, room and ambient air temperatures (Jun 25- Oct 1/ 2017)



Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

The digester temperature is directly proportional to CH_4 content in the 00:00 - 3:00 hrs and 6:00 -9:00 hrs. Between 18:00 and 00:00 hrs, the digester temperature slowly descends to 24.15°C while CH_4 content quickly ascends to 52.65%. In the remaining time ranges in Figure 14, digester temperature and CH_4 content are inversely proportional.

Figure 14. CH_4 content and digester temperature relationship (Jun 25- Oct 1/ 2017)



The average CH_4 content in generated biogas from 25/06/2017 to 01/10/2017 was 52.4%, with a standard deviation of 2.9%. Figure 14 shows that the room temperature and digester piping system increased as the average methane content decreased and vice versa.

CH_4 content was higher (averagely 52.8%, with a standard deviation of 0.3%) in the morning when the temperature was very low. Then CH_4 content decreased to 51.9% at 18:00 hours when the temperature inside the digester and the digester piping system was in the high range. This phenomenon may be due to the high solubility of carbon dioxide (CO_2), one of the principal constituents of biogas in the water at low temperatures. The solubility is given as moles of solute, i.e. CO_2 per 100 grams of solvent, e.g. water. Wu *et al.* (2006) reported that CO_2 has half of the solubility at 60°C compared to the same quantity of CO_2 when the temperature was 35°C and found this phenomenon after a laboratory-scale experiment. The aim was to assess the influence of temperature fluctuation on thermophilic anaerobic digestion of municipal organic solid waste. Therefore, this study's relationship between CH_4 content and temperature is supported scientifically.

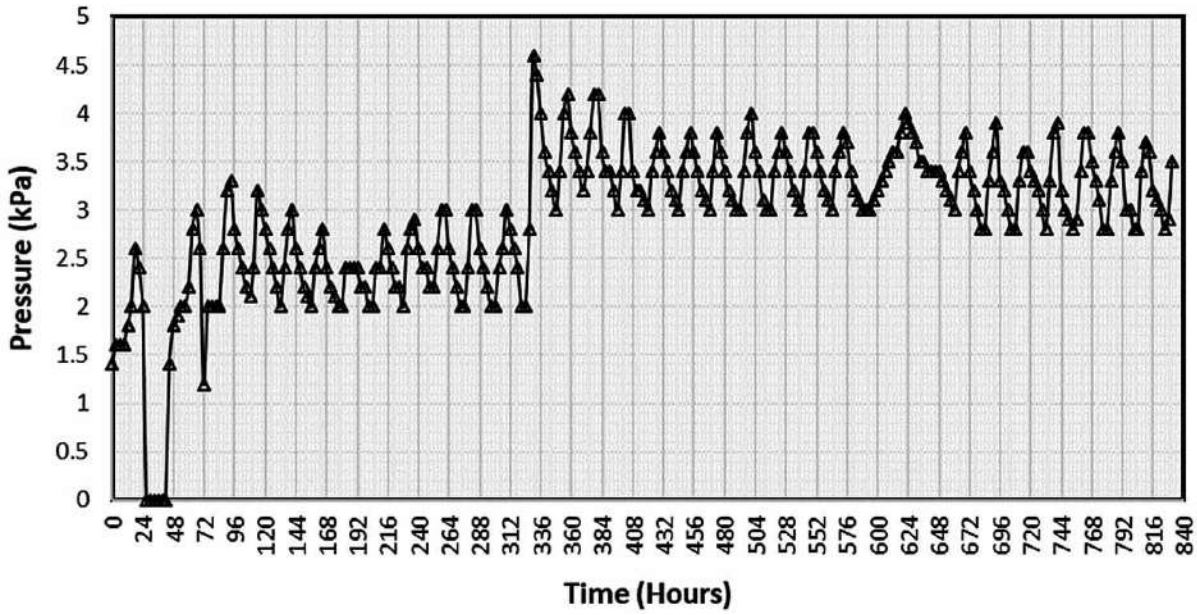
Pressure, DO, and pH in the ABFAD System

There are various indicators of the functionality of the anaerobic digestion system, including pressure inside the digester. Pressure can indicate whether the system is leaking or not, as it was described by Oloche *et al.* (2017) on testing the underground ADS. In addition, pressure indicates the amount of biogas in the system. Figure 15 shows pressure variations of the ABFADS when the system leaks due to the failure of some pipe fittings. Pressure rose to maximum levels between 15:00 and 18:00 hours

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

and then decreased afterwards before rising again from 9:00 hours. This phenomenon is indicated by the peak and trough of the pressure curve in Figure 15. Besides, the phenomenon is shown clearly in the expanded view in Figure 16. The curves in both figures (Figures 15 and 16) indicate leakage of biogas from the ABFADS, calling for immediate remedial measures.

Figure 15. Pressure variation of ABFADS (08/07/2017 (21:00 hours) - 10/08/2017)



Furthermore, the rising pressure in the daytime at high temperatures indicates more biogas generation than biogas leakage from the system. This condition may also imply that biogas generation microbes are very active, producing biogas at high temperatures, as shown in Figure 16. As temperature decreases, the generation of biogas declines. It implies the reduced activity of microbes to generate biogas, while the rate of biogas leakage is higher than the rate of biogas generation; hence, the pressure in the system drops. In the phenomenon of system leakage, the pressure was hardly above 4.5 kPa.

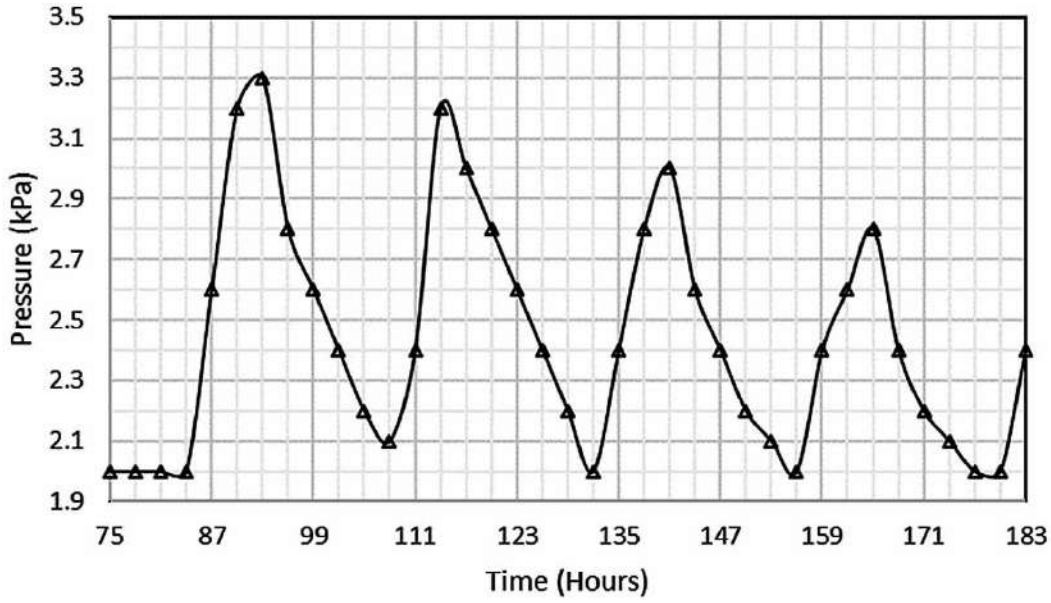
Figure 16. Pressure variation of ABFADS (12/07/2017 (00:00 hours) - 16/07/2017)



Window 24-48 hours, 75-81 hours, 321-327 hours, and 588-594 hours in Figure 15 indicate the time of remedying the fault pipefittings identified after troubleshooting. The pressure rise after window 321-327 hours indicates the improvement of sealing the biogas leakage. However, rising and falling pressure levels continued afterwards. Finally, at 831 hours, the pressure recording was stopped, and the piping system of ABFADS was disassembled and reassembled to replace all of its faulty pipe fittings. Generally, both pressure curves in Figures 15 and 16 have a shape similar to a sinusoidal curve presented by Kuhi *et al.* (2019).

Figures 17 and 18 illustrate the pressure variation in the ADS after fixing the faults causing leakage. The leakage occurred on the top lid. The rubber gasket of 2 mm thickness was replaced with that of 4 mm thick. In this case, a pressure drop did not occur without releasing biogas for the boiling test and replacing the biogas storage. The sudden drop in pressure seen in Figure 17 indicates the event of releasing generated biogas from the storage or replacing the biogas storage. In Figure 17, the pressure drops within windows of 12-24 hours and 228-240 hours were due to the change of biogas storage with the empty biogas storage. At the same time, the rest occurred due to boiling tests. However, the pressure rising rate decreased as the pressure level increased in the ABFADS (Figure 18). The situation might have been caused by the biogas compressibility, digester's biogas generating rate, and or physical elasticity property of the biogas storage. The biogas storage, i.e. inner tyre tube, was proven to safely withstand a pressure of up to 10.8 kPa (Figure 17 at 228 hours). Generally, the shape of increasing pressure curve before the pressure drop in the system is similar to that of the logarithmic curve (Figures 17 and 18). Grossman-Ponemon *et al.* (2019) have described the logarithmic curve.

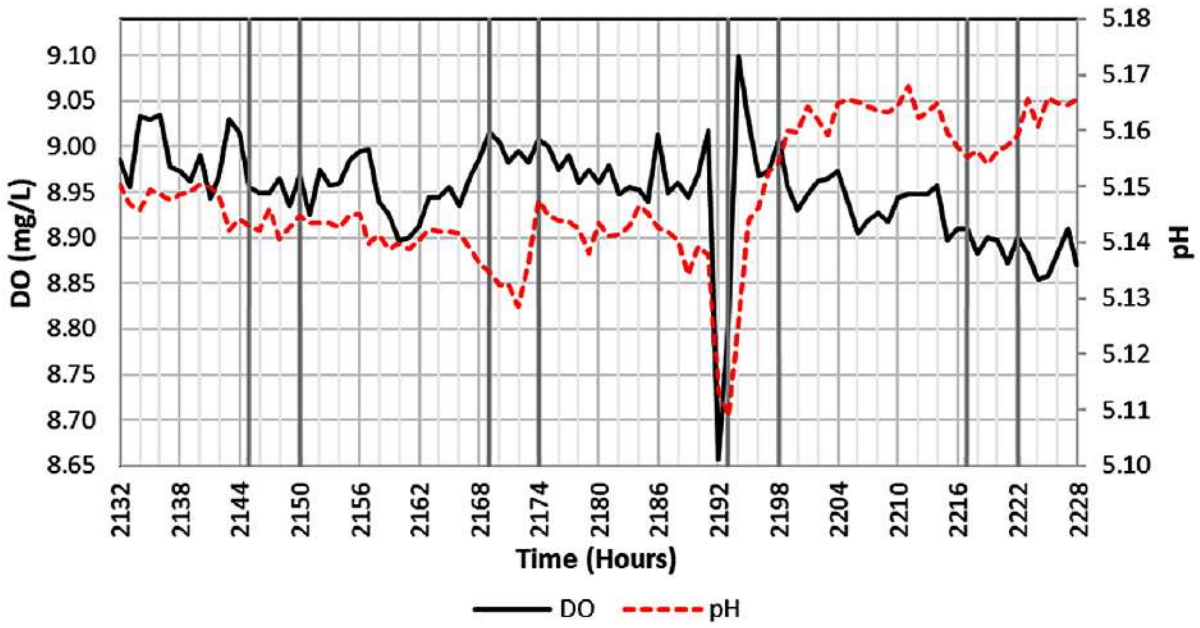
Generally, Figure 19 shows that pH dropped when the temperature was high in the afternoon. This condition is shown in windows 2144-2150 hours, 2168-2174 hours, 2192-2198 hours, and 2216-2222 hours, indicated with bolded vertical lines in the same figure. However, DO was not constantly dropping in the afternoon as pH did. This phenomenon is shown in windows 2192-2198 hours and 2216-2222 hours of Figure 19. Referring to the same figure and Figure 19, both DO and pH values were high when the digester temperature was low, i.e. from 19:00 to 11:00 hours. The digester's pH variation appeared to be influenced more by the digester temperature than the temperature did to DO. Generally, DO in the digester during testing was between 8.8 and 9.0 mg/L while pH was 5.11-5.15 range.

Figure 19. DO & pH versa time of ABFADS (13/09/2017 (00:00 hours) - 17/09/2017)



Although not tested, the durability of the ABFADS was envisaged to be more than 15 years if kept away from ultraviolet radiation and physical damage. However, the replacement of a valve made of iron-based material, located between the water trap and digester of ABFADS, is expected to occur after at least seven years (Sun and Nesic, 2007). The replacement is needed because biogas contains a trace of Hydrogen sulphide (H_2S) gas, which corrodes iron materials. The corrosion is caused by the reaction of iron with Sulphur found in H_2S.

SOLUTIONS AND RECOMMENDATIONS

The formulated approach of adapting the biomass-fed digestion system enables the development of the small-sized (with a digester of 0.24 m^3) ABFAD system. The system addresses designs and operational constraints when applying conventional biogas generation systems in RSAAs. Additionally, the system has the following features: no clogging of system biogas flow; easy handling of its auxiliary components

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

like replacing of iron wool and portable biogas storage; withstanding appreciable pressure (10.8 kPa), and self-squeezing capability for easy release of quality biogas with a methane content of 52% ready for use.

The biogas leakage detection in the system using the pressure curves is reliable. The sinusoidal curve shape indicates system leakage, while the logarithmic curve form indicates no system leakage. The pressure values can be measured instantly using pressure gauge tools. The online pressure data collection and curve generation are done with the simple Arduino integrating circuit available in the market. Dissolved Oxygen and pH are indicators of the working condition of the ABFAD system's digester. However, pH is a more reliable indicator of the microbial activities in the system than DO, as the pH. Nevertheless, the DO-value tool can be applied in the absence of the pH-value indicator tool. Simple tools/devices are available for instant online measurement of pH and DO values inside the digester. Therefore, the pressure curves and pH values are appropriate for indicating the working condition of the biogas plant.

The following are recommended to system designers: applying the formulated approach of adapting the biomass-fed digestion system and integrating other renewable energy systems (solar and wind energy-based systems) with the ABFAD system for cooking energy and electricity generation. Also, the households in RSAAs to utilise the ABFAD system. Other recommendations are applying the ABFAD system's pressure in the sinusoidal-curve shape (leaking) and the logarithmic-curve form (not leaking) for identifying the system's operating status, and the system operators to utilise the pH parameter as a reliable indicator of the operating status of the ABFAD system or similar systems

FUTURE RESEARCH DIRECTIONS

The focus of this chapter unlocks future research potential on biomass and climate change issues. The research potentials are investigating the simple-cheap materials, optimising their amount fed in the auxiliary parts of the ABAFAD for improving the quality of the biogas generated, and studying the established operating status indicators of the ABFAD system using other types of biomass.

CONCLUSION

The challenges related to the existing design of the biomass-fed digester and the digester operating status indication are considered in this chapter. In addition, the solutions to address the challenges are devised and demonstrated. The solutions are the formulated explicit conceptual design approach for adapting the biomass-fed digester and the appropriate indicators of the operating condition of the digester for immediate fault detection. The solutions support the theme of Biomass and Bioenergy Solutions for Climate Change Mitigation and Sustainability. The solutions are recommended to the designers and operators of the digester, similar to the ABFAD system.

ACKNOWLEDGMENT

The German Federal Ministry of Education and Research (BMBF) and the Federal Ministry for Economic Cooperation and Development (BMZ) supported this research through the Trans-SEC project, with Project ID No.: 031A249 A-G. The above are ushered with gratitude for this vital support. However,

KEY TERMS AND DEFINITIONS

Adaptation: The reference to a process of varying the system or structure design to get its improved design with high performance for the betterment of the user or community.

Conceptual Designing: An act of extensive outlining of purposes and forms of a system or structure to be established for facilitating the conception of a clear user interface to understand and interpret the system or structure.

Detailed Designing: The process in which the generated system design is refined where plans, specifications and estimates are created and ready for manufacturing or construction.

Rural Semi-Arid Areas: In the sub-Saharan Africa context, a land of marginal crop production potential, quick maturing cereals, and carrying natural vegetation of Acacia-Themeda association but including dry Brachystegia woodland. It is a potentially productive grazing area, limited by bush encroachment, leached soils, and inadequate water.

Chapter 18
Pretreatment of Lignocellulosic Biomass and 2G Ethanol

Hitesha J. Panchal
Parul University, Vadodara, India

Krishan Kumar
Parul University, Vadodara, India

ABSTRACT

Rapid depletion of fossil fuel-based energy sources increased the demand for alternate energy sources. Lignocellulosics-based 2G ethanol can be used as an alternative sustainable source that presents in ample amount. Sources of lignocellulose biomass are wood, food-agriculture wastes, and forest residues. Cellulose, hemicellulose, and lignin are the core components of lignocellulosic biomass. Cellulosic and hemicellulosic biomass are enzymatically hydrolyzed to produce the monomer sugar (such as glucose or xylose) which is further converted into ethanol using fermentation process. The presence of lignin provides physical barrier that limit the access of enzymes required for saccharification. Pretreatment helps in removing the lignin from biomass and reducing recalcitrance. Pretreatment can be done by conventional methods, which are chemical, physical, and biological. This study covers the different methods of pretreatment including their disadvantages and benefits along with saccharification and fermentation processes.

INTRODUCTION

Globally, the rapid use of energy causes the rapid reduction of fossil fuel-based energy sources. Also, the chief concern with its frequent use is that it releases harmful (unfavourable) gases like methane, CO, CO_2, nitrous oxide, etc. which are known as greenhouse gases (Houghton, 2005). Since these energy sources are vanishing, we need to emphasis on finding its sustainable alternative source. The goal should be to develop a long-term sustainable energy source that emphasizes “recovery and reuse” of bio-derived raw materials.

Lignocellulosic biomass (LCB) has acknowledged a lot of interest as a renewable, sustainable energy source. LCB has the potential for meeting future energy requirements while posing no environmental risks (Ahmad *et al*.,2020). Wheat straws, rice husk, sugarcane bagasse, forest and agricultural wastes, industrial and urban trash might all be good sources of lignocellulosic biomass (LB) (bioethanol) (Zheng *et al*., 2014; Amin *et al*., 2017).

Traditionally, sugar and starch-based feedstocks including sugarcane juice and molasses, as well as corn, have been used to make bioethanol (Balan *et al*., 2013). Bioethanol is currently being generated on a commercial scale using lignocellulosic feedstocks (Balan *et al*., 2013). LBM is the most abundant raw material found in nature which includes sources like hardwood, grasses, softwood, agricultural wastes, etc. Newsprint, office paper, municipal solid wastes, and other raw materials might be of interest as well. Starch is a simple substrate, whereas lignocellulosic biomass is more complicated. Second generation (2G) ethanol is less trending when compared to the first generation ethanol, and it is still less economical due to its high cost (Furlan *et al*., 2013; Macrelli *et al*., 2014). Several research of sugarcane bagasse-based 2G ethanol production techniques have been conducted. In one study, enzymatic hydrolysis of sugarcane bagasses after diluted acid pretreatment produced fermentable sugar for high yield bioethanol production (Benjamin *et al*., 2013; Albuquerque *et al*., 2013).

Lignocellulosic biomass is made of three key components which are cellulose, hemicellulose, and lignin. In which cellulose is the polysaccharide present in great amount therefore known as the most abundant LBM. Cellulose is the linear chain of glucose linked via β-1,4 glycosidic linkages. Hemicellulose is branched heteropolymer whereas coniferyl alcohol, sinaphyl alcohol and p-coumaryl alcohol make form the three-dimensional macromolecule lignin. Lignin causes the recalcitrance in the LBM (Alonso *et al.,*2012).

Since this recalcitrance of lignocellulose biomass is being the hurdle in bioethanol production, so, it should be reduced to get efficient yield of bioethanol. The recalcitrance of biomass can be reduced by using numerous pretreatment methods like chemical pretreatment, biological and physical pretreatment. By doing pretreatment we can increase the enzyme accessibility and hydrolysis of cellulose and hemicellulose polysaccharides, which further leads to higher bioethanol yield.

LIGNOCELLULOSIC BIOMASS

Lignocellulosic biomass is ubiquitous and sustainable resource which is composed of polysaccharides (cellulose and hemicelluloses) and an aromatic polymer (lignin) (Fengel *et al*., 1984). The percentage of cellulose, hemicellulose and lignin varies with respect to sources (Table 1).

COMPONENTS OF LIGNOCELLULOSIC BIOMASS

Lignin, hemicellulose and cellulose together makes the lignocellulose biomass. The main chain of cellulose is made up of D-glucose subunits joined by β-1,4 glycosidic linkages (Fengel *et al.*, 1984). Cellulose is present in the cell wall of the plants and is the most abundant biomass. Cellulose is 'bundled' into cellulose fibrils or cellulose bundles (fig 1) and are interlinked to each other through van der Waals and hydrogen bonds (Fengel *et al*., 1984). These cellulose fibrils are generally self-contained and have just a weak hydrogen bonding connection (Fengel *et al*., 1984).

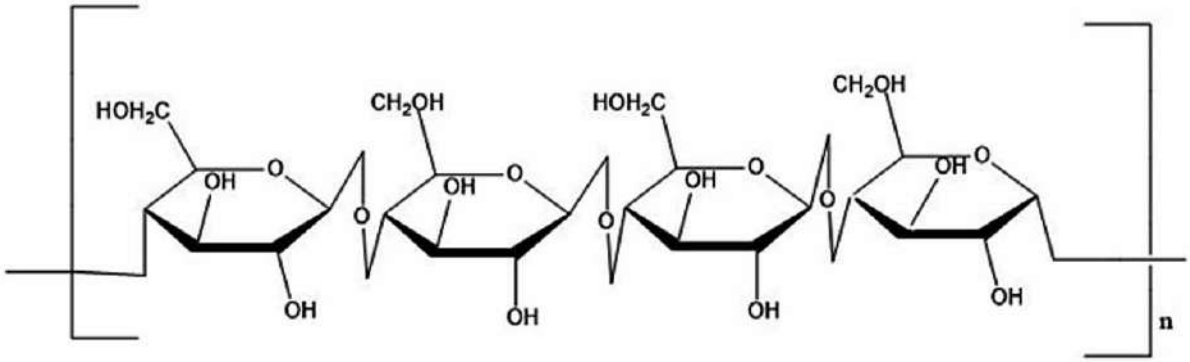
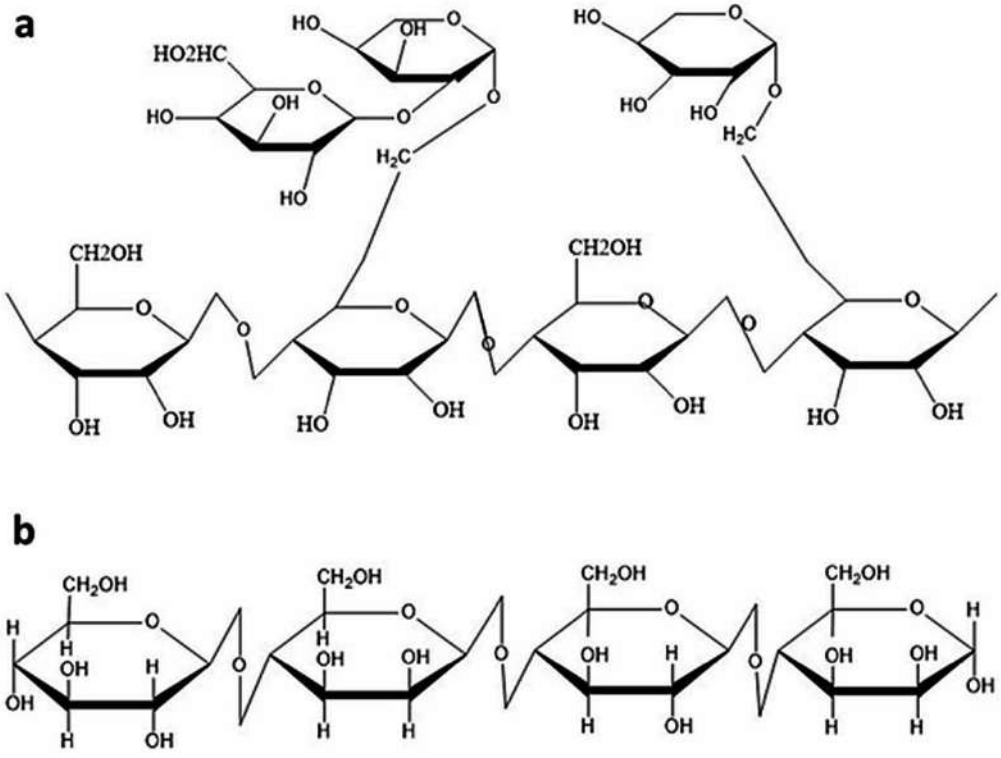
Figure 1. Structure of Cellulose



Xylose, arabinose, and other pentoses, as well as hexoses like mannose, glucose, and galactose, along with sugar acids make form the complex carbohydrate structure known as hemicellulose (fig. 2) (Grabber, 2005). In hardwood and agricultural plants like grasses and straw, xylan is the most prevalent kind of hemicellulose., whereas glucomannan is the most abundant component in softwood (Grabber, 2005). Lignin and cellulose fibers are connected with hemicellulose and this linkage increases the stiffness of the entire cellulose–hemicellulose–lignin complex (Levan et al., 1990; Winandy, 1995). Hemicelluloses are the more thermally reactive compared to cellulose and lignin, because, It's solubility increases as the temperature rises. (Levan et al., 1990; Winandy, 1995).

Figure 2. Structure of Hemicellulose a) Xyloglucan b) Glucomannan



Dr. Ashok Rathoure (asokumr@gmail.com)

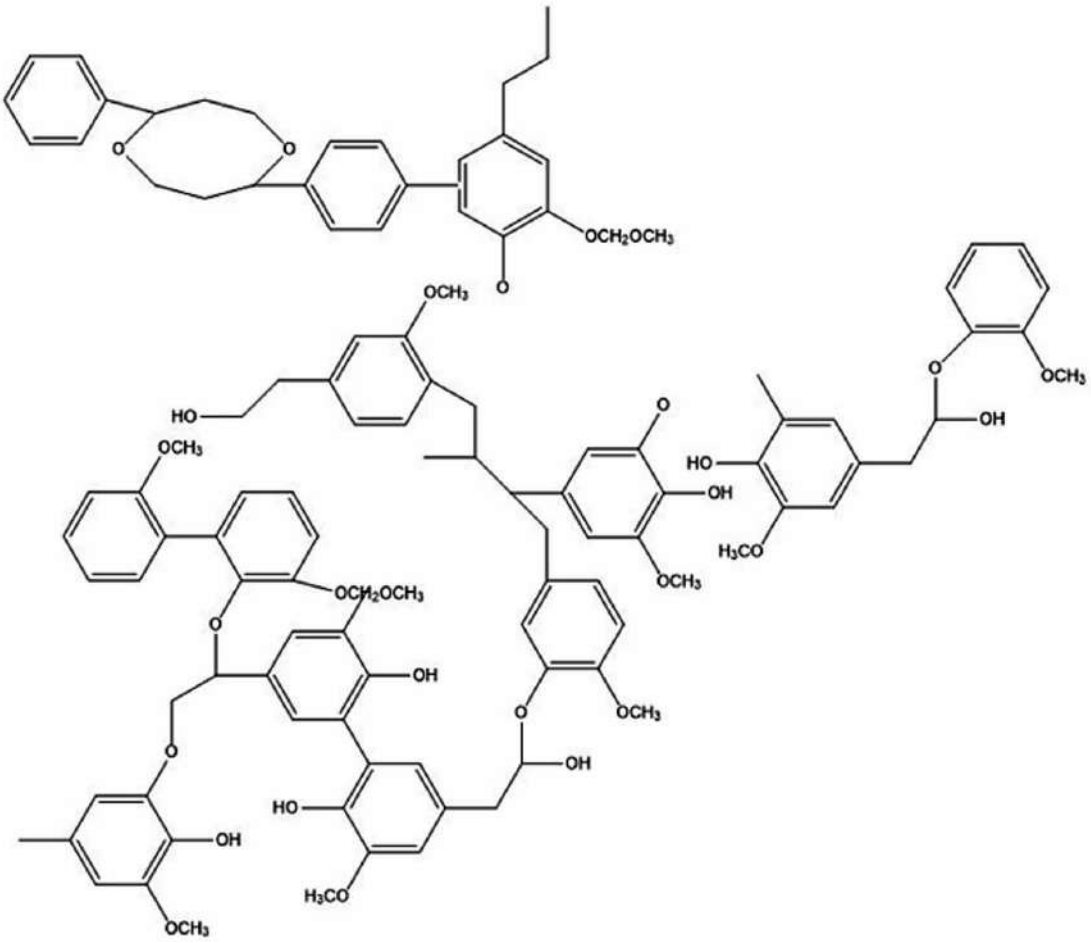
Plant cell walls include lignin, which is one of the plentiful polymer in nature (fig.3), along with hemicellulose and cellulose. Three different phenylpropane units (p-coumaryl, coniferyl, and sinapyl alcohol) together forms the amorphous heteropolymer, which are joined together by various connections (Fengel *et al*., 1984). The key role of lignin in plant cell wall is to provide support to maintain the structure of cell walls and to maintain the impermeability and oxidative stress also, it gives resistance to microbial assault (Grabber, 2005). Under neutral circumstances, lignin dissolves into water at 180^0C (Bobleter,1994). But the lignin's precursor decides whether it dissolves in an acidic, neutral, or alkaline environment (p-coumaryl, coniferyl, sinapyl alcohol, or mixtures thereof).

Figure 3. Structure of Lignin



SOURCES OF LIGNOCELLULOSIC BIOMASS

To date, the majority of ethanol produced as a biofuel has come from edible crops, either through the fermentation of sugars or the conversion of starch from corn (Hill et al. 2006; Chandel and Singh 2011). The most accessible renewable resource on earth is the cell wall of a plant. A long-term option for the

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

production of biofuels is therefore thought to be the manufacture of ethanol from non-crop plant cell walls or non-edible plant parts. Forages, in particular cultivated grasses, can be considered as significant prospects for the generation of cellulosic biomass, and they look to be very promising as a future biomass sources among the numerous kinds of biomass accessible for ethanol synthesis (Hill et al. 2006; Chandel and Singh 2011). The predominant herbaceous energy plants that have been chosen for the production of bioethanol (*Pennisetum purpureum*) include switchgrass (*Panicum virgatum*), miscanthus (*Miscanthus spp. Anderss*.), canary grass (*Phalaris arundinacea*), giant reed (*Arundo donax L.*), alfalfa (*Medicago sativa L.*), and Napier grass (Hill et al. 2006; Chandel and Singh 2011). Willow, eucalyptus, silver maple, eastern cottonwood, green ash, black walnut, sweetgum, and sycamore are a few examples of fast-growing, short-rotation forest trees that can be utilised as a feedstock for biofuels (Hadar et al., 2013). Sources of woody materials include natural forest wastes, forestry wastes including sawdust from sawmills, wood chips, and branches from dead trees, as well as short rotation energy forest plantations that use a variety of fast-growing tree species (Hadar et al., 2013). Municipal Solid Waste (MSW), which consists of paper and cardboard, food scraps, and garden waste, can be converted into biofuel, but it is not the best feedstock because of the variety of MSW components, as well as the incomplete source separation and contamination (Li et al., 2007).

Rice straw, wheat straw, maize stover, and sugarcane bagasse are the agricultural wastes that are most readily available in terms of biomass (Kim *et al*., 2004). One of the most significant agricultural crops in countries with tropical climates is sugarcane. Bagasse, the byproduct of sugarcane obtained after crushing the sugarcane to get the juice, is required for the production of sugar and ethanol. It has an advantage over other crop leftovers since it saves the time and resources (Chandel *et al*., 2012).

PRETREATMENT

Hydrolysis of polysaccharide components to soluble sugars, which may then be fermented to produce desired end products, is used to produce fuels from renewable lignocellulosic sources (Singh *et al*., 2015). Because such materials are only partially digestible in their natural state, some sort of pretreatment is usually necessary to make the carbohydrate component amenable to enzymatic hydrolysis (Singh *et al*., 2015). Degradation of lignocellulosic biomass is difficult due to its intrinsic recalcitrance. Pretreatment disrupts the lignocellulosic biomass's tightly packed structure and reveals the fibres made of cellulose and hemicellulose (Singh *et al.,* 2015). Using a mix of chemical and structural changes to the lignin and carbohydrates, the lignocellulosic material is processed in order to overcome recalcitrance (Singh *et al.,* 2015). The diverse composition and refractory nature of the cellulosic fraction of the biomass provide major challenges in the conversion strategy. Pretreatment is used to render cellulosic and hemicellulosic biomass susceptible to enzyme activity (Bharat *et al*., 2013). The main factors influencing accessibility and digestibility are cellulose crystallinity, hemicellulose disruption, accessible surface area (porosity), lignin protection, and cellulose-hemicellulose-lignin linkage.

Hemicellulose and lignin are ubiquitous polymers, while cellulose is the primary contributor to the crystalline component. Lignin serves as a barrier to prevent the deteriaration of cellulose and hemicellulose. Because lignin and hemicellulose are chemically related through covalent bonding, removing lignin will result in the elimination of hemicellulose as well. To improve the specific surface area and crystallinity of cellulose, it requires pretreatment to eliminate these amorphous polymers (Y.P *et al*.,2013).

Fractionation and delignification are two popular pretreatment methods for this lignocellulosic material. Fractionation is a process for separating the components of lignocellulosic biomass by disturbing the biopolymer pattern to enhance access to polysaccharides in lignocellulosic biomass. Delignification is used to remove lignin, although it can also separate hemicellulose fractions. To extract lignin for exposing cellulose to enzymatic hydrolysis, delignification is usually incorporated in the fractionation process. Physical, chemical, biological and physicochemical methods are some of the pretreatment methods (fig 4). Physical pretreatment method includes size reduction, microwave irradiation, etc. Chemical pretreatment method includes alkaline, acid and organic solvent methods. Physicochemical pretreatment methods are hot water, steam explosion whereas biological pretreatment methods deal with microorganisms. Advantages and disadvantages of different types pretreatment methods are shown in table 2.

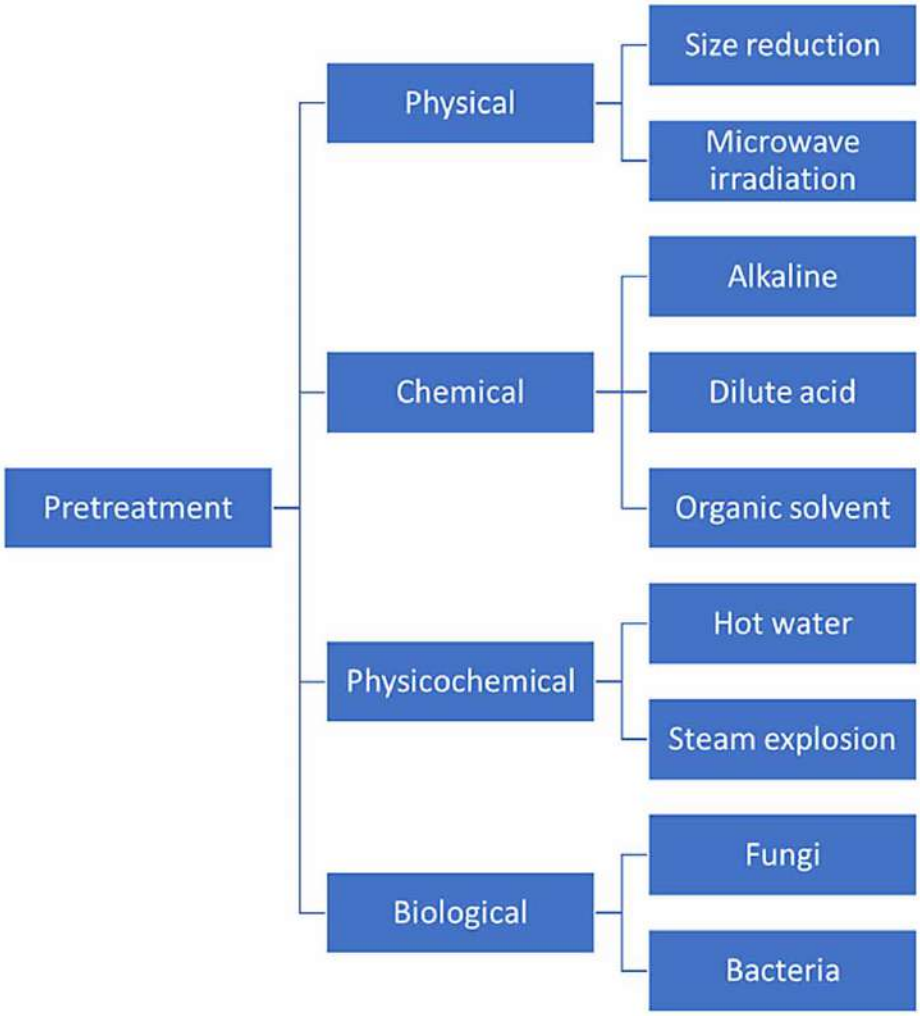
Figure 4. Types of pretreatment methods



1. Physical Pretreatment Methods

These techniques are employed to change the size of the biomass and break the crystal structure of LBM.

a) Size Reduction Pretreatment Method

Size reduction is a common approach used for pretreatment of lignocellulose biomass through which polymerization and cellulose crystallinity is lowered. The size of biomass can be reduced by employing various physical size reduction methods like milling (using a ball or hammer and vibratory rod/ball milling), shredding, chipping and grinding (J.Y *et al*., 2013). The amount of power required for mechanical size reduction is determined on the basis of the moisture content and the size of the biomass. As a result, particle size has an impact on specific energy consumption. Because of the need for high mass and heat transfer efficiency, the design of handling, transportation, and conversion facilities will

Dr. Ashok Rathoure (asokumr@gmail.com)
IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

certainly be determined by the selection of an appropriate particle size of the biomass (Barakat *et al*., 2013; J.Y *et al*., 2013).

b) Microwave Irradiation Pretreatment Method

Microwave irradiation for lignocellulosic biomass is another type of physical preparation. The remarkable heating efficiency and simplicity of this pretreatment method, which has been improved over time, are well known. Physical, chemical, and biological processes speed up as a result of heat and many collisions brought on by polar molecule oscillation and ion movement. The lignocellulosic material's performance is influenced by its dielectric properties. The ability of a material to convert electromagnetic energy into heat is measured by the dielectric loss factor, as opposed to a material's capability to store electromagnetic energy (H. Ma *et al*., 2009).

2. Chemical Pretreatment Methods

The recalcitrant structure of lignocellulose materials can also be changed by treating with chemicals. These pretreatment methods majorly include alkaline method, dilute acid method and organic solvent method to reduce the crystallinity.

a) Acid Pretreatment Method

Acid pretreatment is used primary to remove hemicellulose from lignocellulose biomass. Enzymes are more easily accessible to cellulose after pretreatment of biomass using an acidic method (Velmurugan *et al.,* 2011). Sulfuric acid, acetic acid, and phosphoric acid are the three acids that are used for pretreatment the most frequently (Rezania *et al.,*2020). Acid pretreatment can be carried out in two distinct ways: concentrated acid pretreatment at comparatively lower temperatures, and diluted acid pretreatment at higher temperatures (Rezania *et al.,*2020). By-products of acid pretreatment include 5-hydroxymethyfurfural and 2-furfuraldehyde. Peracetic acid pretreatment can also successfully remove lignin and produce hemicellulose breakdown, revealing cellulose. Acid pretreatment eliminates almost all carboxylic acid changes, including acetyl groups and uronic acids. (Park *et al*., 2012; Zhao *et al*.,2008). It removes the hemicellulose component and promotes the crystallinity of the biomass (Zhao *et al*.,2008). The residence time might last anywhere between a few seconds and minutes, depending on the pretreatment's temperature. In a stainless-steel reactor, an aqueous substrate solution is heated to the necessary temperature and then processed with warmed sulfuric acid.

b) Alkaline Pretreatment Method

For the pretreatment of biomass, hydroxides of potassium (K), sodium (Na), ammonium (NH_4), and calcium (Ca) are used in alkaline pretreatment method. This pretreatment technique causes the biomass to swell, increasing its internal surface area while decreasing its level of polymerization and cellulose crystallinity (Chandra *et al.,* 2007). Alkaline pretreatment alters the structure of lignin and removes the bonds that bind it to the other carbohydrate fractions, making the heteromatrix's carbohydrates more accessible. As the lignin is eliminated, the efficiency of polysaccharide enzyme hydrolysis rises (Galbe *et al.,* 2007). Alkali pretreatments also get rid of acetyl and other uronic acid substitutions on hemicellulose

IGI Global Platform
Downloaded: 11/24/2022 10:06:19 AM
IP Address: 223.238.231.239

that make the surface of the cellulose less accessible to enzymes (Mosier *et al.,*2005). When, compared to acid pretreatment with HCl and H_2SO4, alkaline pretreatment with NaOH generally removes more lignin (Zhao *et al*.,2008). There are no by-products of the alkaline treatments. It results in increased lignin removal, biomass porosity, and cellulose swelling. Almost all carboxylic acid substitutions will be eliminated by alkaline pretreatment (Garlock *et al*., 2011; Park *et al*., 2012; Zhao *et al*.,2008).

c) Organic Solvent Pretreatment Method

The organosolv procedure is another appealing chemical pretreatment. This method has been widely used to extract high-quality lignin. Greater biomass conversion results from the removal of lignin from the biomass because this makes the cellulose fibres available to enzymes for hydrolysis and limits the amount of lignin that cellulolytic enzymes can digest. (Wormeyer *et al*.,2011). In this process mixture of aqueous organic solvent (ethanol, methanol, ethylene glycol, and acetone) is added with or without use of catalyst (Acid, base, or salt) along with high temperature. By doing so, linakages of hemiceelulose and lignin are cleaved due to solubilization which improves the surface area overall for enzymatic hydrolysis of cellulose (Hage *et al*.,2009 ; Wormeyer *et al*.,2011).

3. Physicochemical Pretreatment Methods

a) Liquid Hot Water Pretreatment Method

This pretreatment method uses H_2O at high temperature to reduce the crystallinity of lignocellulosic biomass. Using this technique, lignin is removed and the hemicellulose is hydrolyzed along with the cellulose making them easily accessible to the enzymes. The hemiacetal linkages are broken down followed by acid liberation during the hydrolysis of biomass by hot water (Antal,1996). Because lower temperatures are used, there is less chance of degradation products forming. And since, the pretreatment solvent in this case is water, there is no need for a final washing or neutralising step. For large-scale applications, the solvent's low cost is also a benefit.

b) Steam Explosion Pretreatment Method

In Steam explosion process, before being physically treated with high-pressure saturated steam in the steam explosion process, biomass is chipped, crushed, or just left raw. Because of the high temperature, the hemicellulose breaks down and lignin is transformed, enhancing the possibility for cellulose hydrolysis (Agbor *et al*., 2011). Poplar plant chips processed by steam explosion showed enzymatic hydrolysis efficiency of 90% in 24 hours, while untreated chips showed only 15% hydrolysis efficiency (Grous *et al*.,1986). The increase in enzymatic efficiency gave the clear idea about the role of steam explosion in the LBM's pretreatment.

4. Biological Pretreatment Methods

Biological pretreatment methods include the use of Fungi and bacteria. Fungi like White-rot fungi (*Dichmitus squalens, Phlebia radiata, Rigidosporus lignosus, Phanerochaete chrysosporium,* and *Jungua separabilima*), brown-rot fungi (*Serpula lacrymans, sulfur shelf, Fomitopsis pinicola and Phae-*

IP Address: 223.238.231.239

olus schweinitzii), soft-rot fungi (*Chaetomium, Ceratocystis,* and *Kretzschmaria deusta*), and bacteria (*Clostridium thermocellum, Caldicellulosiruptor saccharolyticus, Caldicellulosiruptor bescii* (Putro *et al., 2016)* are used to change chemical composition of LBM to make it more enzymatically digestible. Fungi degrade lignocellulosic biomass in different ways. White-rot fungus breakdown lignin more aggressively, whereas brown and soft rots fungi target cellulose and showed less effect on lignin (Putro *et al., 2016*). Degradation of lignocellulosic materials has been explored using many microorganisms with thermostable or thermophilic activity such microorganisms are called thermophilic microorganisms. These microorganisms provide a number of benefits, including a faster hydrolysis time, great tolerance to low and high pH, reduced contamination risk, and cheap energy costs.

Table 2. Advantages and Disadvantages of various pretreatment methods.

Pretreatment Methods	Advantages	Disadvantages	Reference
Size reduction	Disrupt biomass crystallinity, reduces the degree of polymerization	Larger the particle size lowers the crystallinity.	Barakat *et al*.,2013; J.Y *et al*., 2013.
Microwave irradiation	Facilitate the disruption of recalcitrant structures	High cost	H. Ma *et al*., 2009
Alkaline method	Lignin structure is disrupted	Highly costly and used for small scale only.	Park *et al*., 2012; Zhao *et al*.,2008
Organic solvent method	Hydrolyses hemicellulose and lignin.	High cost	Hage *et al*.,2009
Acid method	High yield of end product (sugars)	Degradation products are generated.	Zhao *et al*.,2008
Hot water method	No need to reduce size of biomass, chemicals	Toxic compounds are formed.	Bobleter, 1994
Steam explosion method	Alters lignin and solubilize hemicellulose	Partially degrade hemicellulose	Mes-Hartree *et al.,* 1988
Biological method	No requirement of chemicals. Causes delignification	Process is slow and not very efficient.	Putro *et al., 2016;* Maurya *et al.,*2015

2G ETHANOL

The biofuel with the greatest potential to replace oil-based fuels is second-generation (2G) ethanol made from lignocellulosic biomass (Seabra *et al*.,2010). The stages involved in producing ethanol from lignocellulosic biomass are as follows: 1) pretreatment of lignocellulosic biomass 2) saccharification 3) fermentation as shown in fig 5.

Because LBM's high resistant structure restricts the accessibility of cellulose and hemicelluloses to hydrolytic enzymes and prevents the release of sugars, it hinders the enzymatic hydrolysis process. To, achieve effective and quick enzymatic hydrolysis of carbohydrates, biomass must be pretreated to change its structure (Mosier *et al*., 2005). Lignocellulosic ethanol production involves the enzymatic degradation of cellulose and hemicelluloses into fermentable sugars (Pan *et al*., 2005). The composition and structure of the feedstocks, the pretreatment technique utilised, and the kind of enzymes used are all factors that affect this stage. Enzyme costs and catalytic efficiency are a key stumbling block to enhancing the bioethanol industry's profitability. Optimizing enzyme mixtures for enzymatic hydrolysis

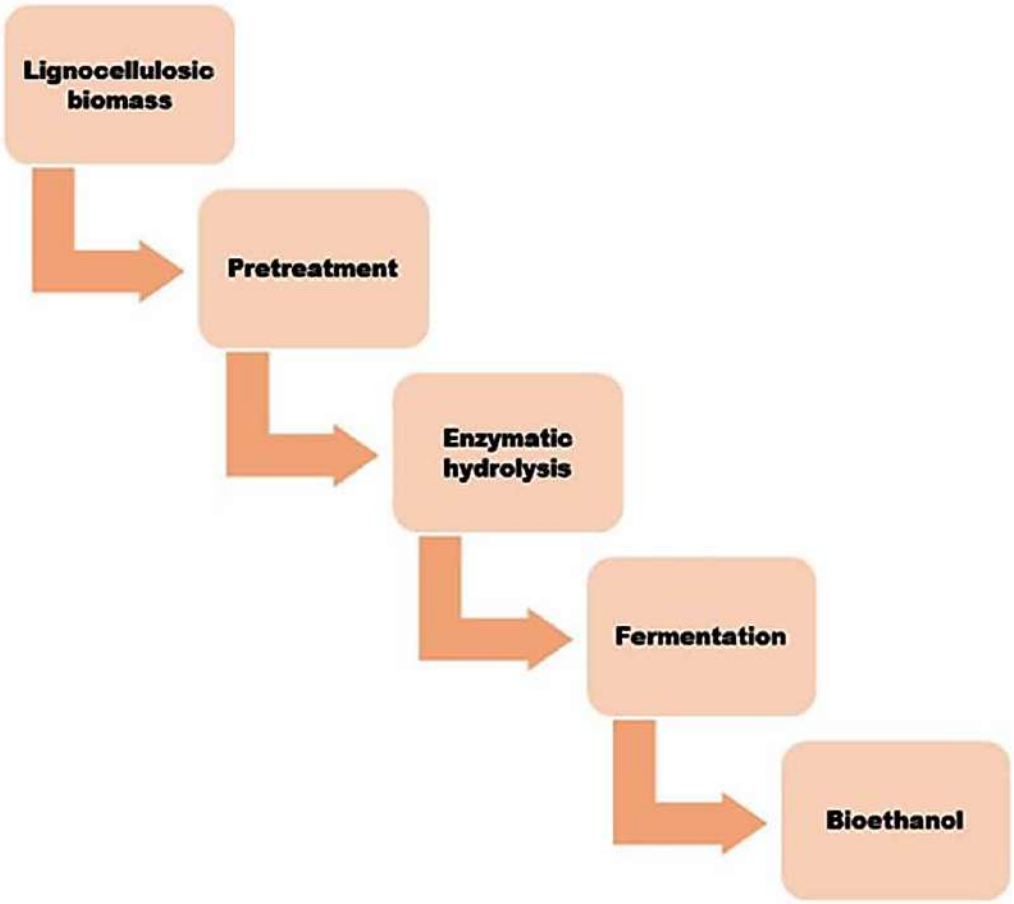
is crucial for the economic viability of lignocellulosic ethanol production. Now in case of saccharification and fermentation, it can be done separately or simultaneously.

Figure 5. Production of Bioethanol



a) Hydrolysis of LBM

Fermentable sugars from hemicellulose and cellulose is obtained through the hydrolysis process. Hydrolysis process is of two types namely acidic and enzymatic. The process in which acid is used is called acid hydrolysis and enzymatic hydrolysis involves enzyme (Jatoi *etal.,*2021). In order to acquire a higher yield of fermentable sugars, which are then turned into ethanol, hydrolysis is one of the important steps in the manufacturing of ethanol.

i) Enzymatic Hydrolysis

Either commercial enzyme systems, which are more feasible and often used on an industrial scale, or microorganisms that release enzymes into the media can produce enzymatic hydrolysis. (Klein *et al.,*

Dr. Ashok Rathoure (asokumr@gmail.com)

IP Address: 223.238.231.239

2012). But for industrial utilization the only drawback is its higher enzyme cost (Klein *et al.,*2015). Hemicelluloses, have complex structure in comparison to cellulose. While cellulose is not that complex structure but still there is need of several enzymes for complete hydrolysis. Hemicelluloses include xylans, mannans, xyloglucans, and glucomannans, as well as β 1-3,1-4 glucans which are hydrolysed by their respective enzymes like xylanase, mannanase and β-glucnase etc., whereas cellulose is hydrolyzed by cellulase enzyme, which includes endoglucanase, exoglucanase, and glucosidses.

ii) Acid Hydrolysis

Acid hydrolysis is called the chemical hydrolysis. Acid hydrolysis method is advantageous in comparison to enzymatic hydrolysis since reaction rate achieved is higher than enzymatic hydrolysis (Cheah *et al.,*2020). Dilute acid hydrolysis is commonly used to break down hemicellulose and to prepare cellulose for enzyme digestion. This hydrolysis can be achieved by two ways 1) concentrated acids, low temperature, long reaction time 2) high temperature, dilute acids, short reaction time (Balat *et al.,*2011). The major drawback with concentrated acids is its toxicity and corrosive properties that can reduce the fermentation yield (Balat, 2007). While dilute acid provided by low temperature is favorable for depolymerization of hemicellulose and cellulose at high temperature (Rezania *et al.,*2018). Acids like hydrogen sulphate, phosphoric acids with appropriate concentrations and optimum required temperatures are often used in this acid hydrolysis method.

b) Fermentation of LBM

The hydrolysis step releases the simple sugars such as glucose, xylose and mannose etc. in the optimized condition. This simple sugar can be converted to bioethanol using fermentation techniques. Yeast strains such as *Sacchromyces cerevisiae*, *Pichia stipitis*, *Kluyveromyces fagilis* were used for bioethanol production from different types of monomer sugars. *S. cerevisiae*, one of these yeast varieties, has been widely employed in industry sector for the manufacture of bioethanol since it can withstand a wide pH range. (Azhar et al., 2017).

There are various ways through which fermentation is done namely continuous, batch, and fed-batch fermentation processing (Jatoi *et al.,*2021). Type of fermentation process is dependent or can say determined by feedstock origin and by nature and type of microorganisms used (Huang *et al.,*2018).

Advantage of Fed-batch fermentation is that if critical process parameters are maintained then maximum viable cell concentration is achieved as a result (Balat *et al.,*2011). One downside of this method is that Feed-rate limits productivity, which is restricted by concentration of cell mass. Continuous fermentation process gives more output in comparison to batch processing.

The two fermentation techniques are submerged fermentation and solid state fermentation. Water to lignocellulose ratios of 1:1 to 10:1 are used to wet the biomass by depositing a thin layer of water on its surface. (Lee *et al.,*1997). Fermentation process can be done separately or can be done simultaneously with saccharification. Separate fermentation is time consuming while simultaneous saccharification and fermentation is less time consuming. Still the research is going on this topic, through which we can reduce time and cost of process.

CONCLUSION

Lignocellulosic biomass is available at an affordable price, has a high carbohydrate content, is adaptable, and is not competitive with food and feed. The scientific and technological aspects of producing lignocellulosic ethanol have been extensively studied in recent years. However, the economic applicability of LBM is still constrained by the exceedingly challenging ethanol conversion process. Several parameters, including cellulose crystallinity, accessible surface area, and lignin concentration, restrict the biodegradability of lignocellulosic biomass. To, increase ethanol production, numerous pretreatment procedures for lignocellulosic biomass have been described. The hydrolysis of cellulose and hemicellulose is restricted by the existence of lignin and the crystallinity of cellulose. Lignin removal and crystallinity reduction are accomplished using a variety of pretreatment techniques, including physical, chemical, and biological ones. Pretreatment method is followed by saccharification and fermentation, these both processes can be done simultaneously or separately. saccharification is done by using different enzymes such as cellulases, xylanase, mannanase and β-glucnase etc. These enzymes depolymerize the ccomplex sugars and convert it into simple sugar. This simple sugar then subjected to fermentation to get ethanol as final product. *Sacchromyces cerevisiae*, *Pichia stipitis*, *Kluyveromyces fagilis* are the yeast used for conversion of sugar to ethanol. Thus, by using these techniques (pretreatment, saccharification and fermentation) lignocellulose biomass can be converted into bioethanol that can overcome the energy requirement and can a best alternative of fossil fuel-based energy source.
